The term "public interest" has generated a great discussion among scholars, theorists, practitioners, journalists, and social critics but little agreement on what it actually implies: it is a commonly held value; it is the wise or superior interest; it is the moral imperative; and it is a balance of interests (Sorauf 1957, 619–622). A commonly cited definition offered by Lippmann (1955, 42) asserts that the public interest is "what men would choose if they saw clearly, thought rationally, acted disinterestedly and benevolently." This definition gives the term a moral imperative. Lewis (2006, 694) frames the public interest through the demands of modern-day public administration: representation, dialogue, and democratic values. She views public interest as a "process, not as an objectively identifiable endpoint." Indeed, public interest is imbedded in the pursuit of democratic governance and ethics. James Madison in The Federalist No. 45 viewed the public interest as the "real welfare of the great body of the people, is the supreme object to be pursued; and no form of government whatever has any other value than as it may be fitted for the attainment of this object." In his view, the government is not meant only to safeguard individual rights and interest but to fulfill a greater common good.

Public administrators, irrespective of their area of specialization and spheres of operation, share a commitment to public service and pursuance of the public interest. Unlike those in the private sector whose bottom line is profit, public administrators are called upon to serve "a higher purpose" (Hart 1984, 112). The public service is created and resourced to undertake tasks that the general public in a democratic system consider critical enough to warrant government attention. This means that public administrators make professional decisions on behalf of the public and the interests and values that the society holds. Those that work in the public administrative system are therefore called upon to become public stewards, to manage and administer government goods and resources on the government's behalf and on the behalf of the general public.

New public management and its calls for more efficient, economic and entrepreneurial government, in conjunction with collaborative governance which encourages privatization of government functions and reliance on not-for-profit organizations or third parties to achieve public administration objectives, make the work of public administrators more complicated, enhance instances for ethical dilemmas, and ultimately negate the purposes of democratic governance and public interest. Values like responsiveness, representativeness, and equity may be lost in the market-based administrative systems, while traditional avenues of control and accountability common in traditional public service may be weakened in the public-private partnerships. Defending and serving the public interest is public administrator's professional and moral obligation. Public administrators are challenged to harness private and personal interests and transform them to public good.

## Ethics and Public Interest: A Convergence

Public administrators implement policies and programs, enforce regulations, and provide goods and services that the citizenry deems worthy and is willing to sanction government to spend resources on. In undertaking such responsibilities, public servants do and should pursue values like responsiveness, representativeness, equality, openness, transparency, and accountability because these values underpin an administrative system rooted in democracy. Public administrators must therefore recognize that their roles impose both a professional and a moral burden. Ethics provide the moral connection between the democratic values in governance and public administration. As Gawthrop (1998, xiii) asserted, "the ethos of public service, so essential for the spirit of democracy to flourish, can be realized only if directed by a moral imperative bound to the common good." In other words, the public interest (common good) is intrinsic to administrative and democratic tenets. The moral imperative that Gawthrop mentions guides the public worker to discern between practices and activities that are considered right or wrong, and for or against the public interest.

Ethical commitment of public administrators is one of the two issues most critical in the performance of the public stewardship role mentioned earlier in this entry. Stahl (1971, 247) was succinct and apt when he asserted that "problems of ethical conduct arise for the public official by virtue of the power and influence he commands and the commitment he undertakes of loyal and disinterested service to the public." Ethical values like honesty, integrity, fairness, and justice, then, constitute the conduit to serving the public interest. Public administrators are therefore called upon to execute government programs in a manner that makes them true to their professions and the democratic ideals and that maintains values of moral and social responsibility, while engendering public confidence at the same time.

The second issue that fosters public stewardship is abiding by and safeguarding the law. A key attribute of a democratic government is that it is grounded in laws not private predilections of those that work for government. By upholding and abiding by the law, public administrators become the inspiring image of the public interest and common good. When public administrators are viewed with suspicion, cynicism, and distrust, when they are accused of selfishness, unresponsiveness, and corruption and being unaccountable, it means the administrative system has failed the democratic ideals imbedded in the foundation of the discipline.

The ethical public administrator, that is, dedicated to serve the public interest, has commitment to the highest traditions of public service. She or he is responsive to the will of the people, pursues the public interest, and responds to political leadership but is conscious of and protective of constitutional values. Such a person strives to cope with the complexities and conflicts of modern government while maintaining the highest ethical standards.

## Conclusion

From the discussion presented in this entry, we can conclude that administrative values rooted in democracy are embedded in ethical public service. The quest for ethics and public interest in public administration, therefore, can be fulfilled if as Gawthrop (1998, 122) notes, "a conscious and mature awareness of the ethical impulses, political values, transcendent virtues, and moral vision that constitute the dynamic and holistic essence of democracy" is embraced by everyone in the public administration. Anyone wishing to join the public administration system to serve the public must clearly understand and appreciate that she or he is putting the public interest over self-interest. Such a person should also keep in mind that the public interest is lost when public service is unaccompanied by counterbalancing ethos of moral restraint.

## Introduction

The business world has experienced several major scandals, especially over the course of the last decades, with devastating consequences. These scandals and their consequences are due essentially to a lack of ethics and trust. This shows the urgent need to promote ethical management to foster trust in managers and companies in order to redress the growing environment of mistrust which has taken hold.

The purpose of this chapter is threefold: firstly, to discuss concepts of ethics and their theoretical frameworks that facilitate the study of ethical questions in organizations, such as theories from philosophy, psychology, business ethics, and, in particular, the theory of organizational justice. Secondly, it highlights the concept of trust in social sciences and its background components such as competence, fairness, integrity, etc. Finally, the chapter shows the benefits of ethics and trust being applied for organizations.

In general, ethics preclude the emergence of an opportunistic culture that carries risks for organizations. Dejoux (2002, p. 97) argues that: "Talking about ethics in a company is not only a matter of trend or managerial style, but one of the means available to preserve and develop trust relationships necessary for its credibility and sustainability." Essentially, the theoretical frameworks which allow the analysis of the ethical dimensions are the following: firstly, theories of moral philosophy (Aristotle, Kant, Mill), these theories try to describe what makes the acts good or bad; secondly, theories of moral psychology (Kohlberg, Gilligan), these theories are studying how we make decisions; thirdly, modern ethical theories (Rest, Trevino, Victor and Cullen), these theories integrate individual, collective, and contextual variables to explain behaviors in the organization; and finally, the theory of organizational justice, this theory evaluates the rightness or the injustice of an action from the employee's point of view. Organizational justice constitutes a fertile framework to deal with ethical questions in organizations (Hirèche and El Mourabet 2007).

On his side, trust contributes to better business performance and can therefore be considered as a performance factor. Thus, focusing on trust in companies is a pragmatic measure that leads to positive and concrete results. The fierce competition faced by companies implies that all their resources and tools must be used to ensure their sustainability and the welfare of their employees. If ethical considerations improve trust and

therefore employee performance, then companies that neglect them will put themselves at increased risk.

## Ethics

Ethics can be defined as a set of principles that guide our behavior. Ethics is a real concern for all of us. Although not a law, it is, in one way or another, linked to the law and codes of conduct (Loucks 1987). "Ethics is defined as research or the art of the right relation, of the just act, our way of relating to contingency will orient our ethics" (Dherse and Minguet 1998, p. 72). From this definition the meaning that can be given to ethics, in companies, is the sense of justice being integral to the actions and practices that take place in the workplace. To supersede rhetoric engendered by discourses that are too broad to operate on values, ethics must position itself on normative grounds and trace the contours of justice in organizations (de Nanteuil and Cnop 2007). Ethics can also be defined as a questioning, on the nature of good and evil, that precedes action. In the following paragraphs, the theoretical frameworks for dealing with the ethical question are outlined, especially the theory of organizational justice.

## Theories of Moral Philosophy

In philosophy, normative ethics is the branch of ethics that sets standards for judging actions according to the criteria of right and wrong. It is distinguished from metaethics which is the study of the meaning of terms, of the logical relationship between judgments, and of the epistemological status of moral judgments. In respect of applied ethics, it is normative ethics questioned by practical domains. Basically, in normative ethics, there are three major currents of thought, which are consequentialism, deontology, and virtue ethics.

### Consequentialism

According to the defenders of this current of thought, it is the consequences of an action that determine its nature. The most famous variant of consequentialism is utilitarianism, which is a construct defended by Mill (1871). The latter advances in his work that after more than 2000 years of reflection on this most important of subjects – which is to settle the controversy over the criteria of good and evil – there has been little progress made. Philosophers have always been divided on this subject and unanimity seems far from being achieved. According to Mill, the rules of action must receive their character from the end they serve, because the action is made with a view to an end. If we accept the utility or the principle of the greatest happiness as the foundation of morality, then we classify an action as good when it has a tendency to promote happiness and as bad in the case where it tends to favor unhappiness. By happiness we mean pleasure and the absence of suffering and by unhappiness, suffering and the absence of pleasure (Mill 1871).

### Deontology

Deontology is derived from the Greek deon (duty) and logos (discourse). In this current of thought, the action is judged according to its conformity to predefined principles independently of the consequences that result from it. Kant is one of the great advocates of this movement. For him, an act is good from a moral point of view if it is done out of duty or out of respect for the law. This respect must prevail over considerations of the welfare or happiness of the individual or others. According to Kant, acting out of duty means acting out of freedom. He considers that it is the duty which absolutely obliges the moral agent without forcing it.

### Virtue Ethics

The essential thing for this current of thought is to perfect the virtues of human beings. Virtue ethics is perfectionist; it emphasizes the existence of character and virtue to which we must strive for independently of the rules and consequences.

Aristotle is one of the great defenders of this current of thought. In his book *Nicomachean Ethics*, he affirms that the just love just deeds and the virtuous love actions conforming to

virtue (Tricot 1959, p. 31). He goes on: "The virtues, then, come neither by nature nor against nature, but nature gives the capacity for acquiring them, and this is developed by training" (p. 42). For him, the things that are provided to us by nature like sight, we receive them first and afterward we make use of them. It is not due to a multitude of acts of vision that we have acquired this sense. On the other hand, the possession of virtue presupposes its earlier exercise. It is by playing the zither that one becomes a citharist; it is by practicing righteous deeds that we become righteous (p. 42).

Generosity, consciousness, loyalty, goodness, benevolence, trustworthiness, etc. are human qualities that are called virtues. The behavior that is typical of a virtuous disposition is a model to be imitated. For example, helping a family member who is experiencing financial difficulties can be considered for consequencialism as good because it maximizes well-being; for deontology as good because it is consistent with the principle of reciprocity ethics, treating others as one would like to be treated; and for virtue ethics as good because it perfects the benevolence of the author.

## Theories of Moral Psychology

Moral psychology is defined by Cova (2011) as "the study of the processes that lead us to formulate moral judgments and its central question can be formulated from: What are the psychological steps needed to develop a moral judgment?"

The theory of cognitive moral development (CMD) is largely mobilized by researchers on ethics in companies, and it has been accepted as a construct to help explain this field. On the other hand, the ethics of care is also an interesting model to take into consideration. These two theories are outlined as follows:

### The Theory of Cognitive Moral Development (CMD)

Kohlberg (1969) has highlighted the processes of reasoning that the individual follows when confronted with an ethical problem. For Kohlberg the moral development of the individual goes through three levels and six stages:

The preconventional level: It is the punishments and external rewards that control moral reasoning. The two stages of this level are the punishment stage (avoid punishment because a punished person has necessarily acted badly) and the reward stage (the justification of the actions is directed towards self-interest (rewards and benefits)).

The conventional level: It is the others who impose the internal standards. The first stage of this level concerns the need for belonging (interpersonal relationships): take into account the consequences on the relationships or the expectations of relatives. The second stage of this level is relative to the consciousness of the laws: the justification tends toward conformity with the law and the social norms.

The postconventional level: Moral reasoning is internal. There are two stages in this level too. The first stage concerns the social conscience (social contract and individual rights): the individual is aware that the laws/rules are social contracts for the good of the greatest number, even sometimes they go against the interest of particular individuals. Decision-making is complex because it takes into consideration the principles of justice and law. The second stage of this level is relative to universal moral principles: the law comes under personal ethical principles. The individual develops his own universal principles of justice, which applies to everyone. In this way, action is never a mean but always an end in itself; the individual acts because he is right and not because it helps to avoid punishment or because it is in his best interest or because it is expected or because it is legal or because it is previously agreed.

According to the author, moral development is sequential, that is, the steps cannot be preceded; it is irreversible, in other words no turning back possible; it is integrative, which means that the individual understands the reasoning of those who are in a lower level in relation to him; it is also

transcultural, that is, it follows the same stages in all cultures; finally in this moral development stagnation is possible, which means that the higher levels are not accessible to everyone.

### Ethics of Care

According to Gilligan's (1982) ethics of care, several elements must be taken into consideration in ethical judgment. Firstly, the relational aspect of the individual, that is, individuals are not really autonomous, but are influenced by others through their relationships. Secondly, there are specific needs of individuals that must be taken into account to ensure their well-being. Thirdly, emotions such as empathy, sympathy, and sensitivity are important in ethical judgment. Finally, although moral reasoning depends on formal and abstract principles, it is very contextual.

## Modern Ethical Theories

Many theories have been developed recently by researchers, in thefield of business ethics, in order to overcome the difficulties posed by the major founding ethical doctrines (philosophy and psychology) in terms of operationalization and access for management practitioners (Hirèche and El Mourabet 2007). In the following, ethical decision-making models and ethical climate theory are developed.

### Ethical Decision-Making

In order to act in an ethical way, the individual goes through several stages. To understand this process, researchers have proposed several models describing the stages preceding ethical or unethical behavior. The interactionist model (Trevino 1986) is a model of ethical decision-making in organizations. It combines individual variables, in this case Kohlberg's cognitive moral development, with situational variables, context, work characteristics, and culture, to explain and predict the ethical decision-making behavior of individuals in organizations. Widely cited in the literature, the Rest (1986) model is one of these. For the author, the ethical decision consists of four components: (1) consciousness, (2) moral judgment, (3) moral intent, and (4) moral behavior.

### Ethical Climate

Interested in ethical issues in organizations, Victor and Cullen (1988) developed the concept of ethical climate which represents employees shared beliefs about what is ethically correct behavior in an organization. They established a typology of ethical climates that can be tested empirically using a questionnaire. From the prevailing climate in organizations, managers can take the appropriate measures.

## Theory of Organizational Justice

The origin of the concept of organizational justice as well as the evolution of work on this concept during the last decades will be outlined. The perception of justice in the workplace is proven as important to achieve performance and thus the sustainability of organizations by guiding the attitudes and behavior of employees. Indeed, the perception of injustice pushes them toward anything that is detrimental to performance such as counterproductive work behavior (CWB). (CWB is behavior that is intended to have a detrimental effect on organizations and their members (Fox et al. 2001).) The perception of justice, however, drives them toward all that is conducive to performance such as organizational citizenship behavior (OCB). ("We redefine OCB as contributions to the maintenance and enhancement of the social and psychological context that supports task performance" Organ (1997, p. 91).)

In the context of work, research on ethical behavior as well as on organizational justice focuses on issues of right and wrong (Crawshaw et al. 2013). The latter argue that research on organizational justice focuses on four recurring issues: (1) why workplace justice is important to individuals, (2) how judgments are made, (3) the consequences of injustice, and (4) what factors predict perceptions of justice. For Schminke et al. (Schminke et al. 1997) organizational justice and normative ethics attempt to answer the following question: What is right? The different

classical philosophical approaches, such as utilitarianism, conceive of justice as a normative ideal, while current research on justice focuses not on what should be but on what individuals perceive as being fair (Greenberg and Colquitt 2014).

Greenberg used the term organizational justice for the first time in 1987 to refer to the perception of equity by individuals in an organization. Organizational justice is defined as "the perceived fairness of the exchanges taking place in an organization, whether social or economic and involving the individual in his/her relationship with his/her superiors, subordinates, colleagues, and with the organization taken as a social system" (Beugré 1998, p. 13). This perception concerns every dimension of organizational justice. These dimensions are developed as follows:

### Distributive Justice

Initially, studies of justice in an organizational setting focused on the distributive dimension. Most of this research is based on the work of Adams (1965), who used the theory of social exchange to evaluate justice. Attribution rules, based on contribution, equality of needs, context, personal motives, or objectives of the organization, aim to achieve distributive justice (Colquitt et al. 2001). All these norms can activate or determine the primacy of certain attribution rules.

### Procedural Justice

Thibaut and Walker (1975) introduced the notion of procedural justice in the literature of justice. By finding that in mediation to resolve a problem between two parties, their involvement in monitoring the process makes it clear to the parties that the process is fair. But Leventhal (1980) extended the notion of procedural justice in nonlegal contexts. For a procedure to be considered fair, Leventhal cited six rules to be respected: firstly, the consistency rule, which means that the procedure is applied in the same way to all persons concerned by the decision and it must be stable over time; secondly, the impartiality rule, in other words the procedure is impartial and free from personal bias; thirdly, the precision rule, that is, procedure is based on accurate and precise information; fourthly, the possibility of correction rule, i.e., appeals allowed against incorrect decisions; fifthly, the representativeness rule, that is, it takes into account the interests of all employees affected by the decision; and finally, the ethics rule, which means that it follows ethical and moral standards in organizations. For example, procedures should avoid trickery, corruption, deceit, or invasion of privacy.

### Interactional Justice

Bies and Moag (1986) noted the importance of the treatment that individuals undergo in the implementation of procedures. They added a third dimension to the literature on justice. Bies and Moag (1986) refer to these aspects of justice as interactional justice. Subsequently, in 1993 Greenberg distinguished between informational justice and interpersonal justice.

### Interpersonal Justice

Interpersonal justice reflects the degree of politeness, dignity, and respect with which people are treated by officials or third parties involved in the execution of procedures (Colquitt 2001).

### Informational Justice

Informational justice focuses on the explanations provided and the information given to those who question the reasons how and on what basis the rewards were distributed (Colquitt 2001).

## Trust

Positive expectation, will, and vulnerability are the most recurring keywords in the definitions of trust. One can say that trust is the willingness to be vulnerable, or willingness to take risks, motivated by a positive expectation. Sitkin and Roth (1993) concluded that almost all researchers accept, even implicitly, that trust is defined as a belief, attitude, or expectation about the likelihood that the actions or results of another individual, group, or organization will be acceptable or will follow the interests of the trustor. In other words, a conception of trust as a psychological state of a positive expectation about the

motivations and future actions of the other is widely accepted in the literature itself in an implicit way.

Trust can be defined as the personal conviction that our rights will be preserved and our efforts will be recognized and rewarded, and our possible faults will be forgiven. This conviction prompts us to give more without asking for guarantees.

## The Concept of Trust in Social Sciences

Williamson (1993) argues that trust is a term that does not have a single meaning. The existence of so many definitions of trust has meant that a single definition is insufficient to grasp the essence of the concept. In each discipline, the concept of trust has been assessed and apprehended in a way that is unique to it. This work shows how some authors have approached this concept in social sciences. This concept of trust is developed in the following paragraphs; this makes it possible to identify practices that can create, develop, and maintain it.

Fukuyama (1995) defined trust as "the expectation that arises in a regular, honest and cooperative community of behavior, based on generally shared norms, on the part of the other members of that community" (p. 26). For him, the common vision of good and evil and a set of shared values are the basis of trust, which influences the behavior of individuals. According to him, thanks to predictability, trust reduces transaction costs and risks. This trust among economic actors is considered here as a central factor in the success of enterprises. In addition to the fact that trust limits contract costs, it also encourages the participation of the various stakeholders and facilitates the allocation of financial resources thus developing flexibility. This translates into increased efficiency. For Fukuyama, most enterprises start in families; they are often limited by an inability to develop relationships of trust beyond the family.

Deutsch (1958) defined trust as being a behavior based on expectation. If the individual perceives that the expected result is not confirmed, this will lead to a negative consequence for his motivation. On the other hand, when it is confirmed, that will lead to a positive consequence for his motivation. An event has a positive consequence for motivation when it increases or prevents a decrease in the well-being of the individual. An event has a negative consequence for motivation when it diminishes or prevents an increase in the well-being of the individual.

Rotter (1967) has largely linked the effectiveness and even the survival of social organizations to the existence of trust. Thus, his study defines interpersonal trust as an expectation of an individual or a group based on speech, verbal, or written promise, considered reliable, of another individual or another group. For others, trust is "a psychological state including the intention to accept vulnerability based on positive expectations about the intentions or behavior of others" (Rousseau et al. 1998).

Given the positive consequences of trust, in terms of reducing transaction costs, on welfare and performance generally, looking at its background and nature seems important.

## Antecedents and Building of Trust

Understanding trust and its track record could facilitate cohesion and cooperation among employees. According to Gambetta (2000), a trustworthy individual implies that the probability that he will act in the direction of our interests or at least not in the opposite direction is high enough for us to consider cooperation with him. For Dejours (1993) "Cooperation: these are the bonds which agents construct among themselves in order to carry out, voluntarily, a common work."

Among these characteristics and actions of the "trustee," Mayer et al. (1995) retained three main characteristics often cited in the literature: capacity, benevolence, and integrity. The value system provides a basis for building trust (Jones and George 1998). For these two authors, values are norms or general principles that are considered intrinsically desirable ends, such as loyalty, helpfulness, fairness, predictability, reliability, honesty, accountability, integrity, competence, coherence, and transparency. They argue that an

individual's system of values promotes trust rather than specific situations and relationships. We can say that these elements are part of ethics. This system of values guides our behavior and determines, possibly in the case of labor relations, with whom we want to have a solid and in-depth relationship.

## Interest in Ethics and Trust

A manager must be able to inspire trust and generate a whole that is superior to the sum of the parts (Drucker 1954). For the latter, it is the integrity, vision, and dedication of managers that determine whether there is management or mismanagement. Ethical behavior and trust between the different actors affect their well-being and thus their performance. Family businesses confirm this; their members generally behave better than actors in nonfamily businesses which this can be explained by the trust that reigns between its members. There seems to be a consensus on the importance of trust and its positive effects on cooperation, commitment, acceptance of decisions, reduction of control costs, conflict resolution, and reduction of uncertainty. The ethics of managers lead to the emergence of a climate of trust and the development of lasting relationships with employees. All these factors contribute to the performance and sustainability of organizations.

## Conclusion

The comparison of an act with a philosophical system makes it possible to define it as fair or not from an ethical point of view. But unfortunately, often there is no consensus to determine which philosophical system should be the reference point (Colquitt et al. 2001). In this sense, the man who is the source of all vices cannot be taken as reference, and his reflection on good and evil will never be final and consensual. Therefore, the source of the principles of the ethics, which should be immutable, must be external to any given man. Individuals should be assessed on the conformity of their facts with the moral principles of the groups to which they voluntarily belong. For Jones and George (1998), shared values promote trust, guide our behavior, and eventually determine, in the case of labor relations, with whom we want to have an in-depth relationship. This positively influences performance.

Finally, it is more judicious to seek values for their intrinsic worth. Knowing beforehand that one is going to derive a profit, as confirmed by studies which have been undertaken or which remains to be discovered, does not detract from the relevance of this search for values in an organization. Turillo et al. (2002) show that individuals can be sensitive to the rules of justice and sometimes seek to punish the moral transgressions of others regardless of personal or economic interest. This sensitivity influences their decision-making. They explain these intrinsic and endogenous reactions by the existence in the human being of a moral requirement which, when satisfied, causes gratuitous pleasure similar to that of the contemplation of a spectacular sunset.

# Ethics and Website Content

Muhammad Ali Hamza
UVAS Business School, University of Veterinary and Animal Sciences, Lahore, Pakistan

## Synonyms

Cyberethics; Ethics and e-business; Internet ethics; Web design ethics; Web ethics and e-issues

## Introduction

The conduct of every community is governed by certain set of ethics. A notion within any community that everyone is accountable for their action and answerable to other members is fundamentally devised by ethical values. Though there may be no punishment for violating ethical standards, but they lead and characterize behavioral norms of any community. In the age where accurate, comprehensive, and apt information has a pivotal role

to play, the initiation of World Wide Web has introduced us to *Web Community*. In fact significant percentage of social activities, business processes, governance, and maintenance of personal relation across the world, today, somewhere relies on effective online exchange of information available upon social, organizational, or personal websites.

Furthermore, websites offer new applications and tools to disseminate and monitor information for and from the masses. This platform can encourage ideas, increase efficiency, help collaborations, assist marketing efforts, receive inputs from consumers, and above all facilitate in establishing an identity; therefore, individual and business level benefits of websites are seen as manifold. World Wide Web as a major source of exchanging information offers a vast store of information coupled with extensive communication capabilities for the people and organizations. It has provided us with an inexpensive, fast, and easy tools and platforms for information sharing. Additionally, World Wide Web introduced a new dimension of electronic maneuvering into traditional activities such as e-governance, e-commerce, e-retailing, e-banking, e-newspaper, e-TV and radio, e-mail, etc. Thus avoidance from the web community is almost impracticable.

The web community is based on web content. Web content can be written (textual), visual, graphical, or audio in nature that is a part of the experience of web audience**;** it could include, among other objects, text, graphics, picture, icons, sounds, films, recordings, simulations, and animations. In *Information Architecture for the World Wide Web*, Rosenfeld and Morville (2002) defines web content as anything on or in ones' web site like e-services, computer applications, audios and videos, images, downloadable data files, archived e-mail messages, and more.

## Maintaining Ethics: A Challenge for Web Community

Parallel to bright side of web community, it also offers a brand new atmosphere for nonethical behaviors and raises concerns regarding the ethical adequacy of the web content available on websites. Unethical content developers, publishers, or users can utilize content for personal gains by misleading the masses of today and tomorrow. Ethical issues in cyberspace and for web community have become as a new challenge. Today, the growth and diversity of website usage for virtual socialization, commercial activities, and governance has brought challenges to assure ethically acceptable content on the website for all stakeholders, whether web professionals or web users.

The concept of ethics in web content covers the concerns such as, development of ethical guidelines, and enforcing adherence to those guidelines, for appropriate content display, and providing a moral framework for navigating the Internet's virtual environment. While discussing web content and its ethical adequacy, there are two distinct but interrelated categories. First is the content development which includes researching, writing, gathering, organizing, editing, and publishing information on websites. Second is content control: a filtering process of screening the content and then either permitting or excluding it from access or availability on the website. In the earlier category the ethical obligation lies with content developers and publishers that include researchers, writers, organizers, editors, publishers, and bloggers. Whereas ethical responsibility in the latter category lies with government authorities, website honors and Internet service providers.

To maintain ethical behaviors on web, professionals identified some generic guidelines to be followed for example preventing cyber-squatting; a practice to buy domain name with not an intent to use, discouraging unsolicited bulk e-mail, spam, malicious program code; viruses or worms, and chain e-mails those imply threats. On the ethical grounds, web professional are in consonance with each other to assure honesty toward customers, sell them what you show on web, and do not overcharge for technical services that they may not understand.

Ethics for web content are not limited to the practices mentioned above, therefore whether we consider websites where content is posted by a

limited number of assigned personnel, or we talk about social websites where content can be developed and shared by anyone, anytime, from anywhere, in both cases the reflective experience and scholarly work has highlighted the following most critical aspect of web content that requires immediate ethical attention.

## Accuracy of Content

The top-rated ethical concern about website content is its accuracy**.** Majority of the visitors on websites tend to blindly believe the information provided on the web, which opens up a danger to mislead the audience and can result in multiple harmful consequences**.** For instance Bruce-Brand et al. (2013) argued that Internet has revolutionized the dissemination of information, and patients can access boundless information on any subject, and when people concern online information on some particular disease they find varied information. This could intensify their apprehensions regarding their physical state, cause inexplicable confusion, or infuse mistrust toward their physician.

White and Horvitz (2009) proposed a term *cyberchondria* to represent the possible mental state after reading inaccurate information based on the Internet. They contended that *cyberchondria* is a rising concern among many healthcare general practitioners as patients can instantly research any and all indications of a disease, illness, or condition and demonstrate a state of medical anxiety. Information inaccuracy can create a chasm between facts and opinions, therefore content development process has to maintain (i) fact as fact and opinion as opinion and (ii) always give credit where credit is due by mentioning the correct source of information.

Under electronic governance or e-governance; *application of information and communication technology (ICT) for extending government services to the citizens*, public organizations also use websites to let a wide range of citizens to access governmental information to increase public participation that helps to progress and reform government bureaucracies, but if the information is incorrect or incomplete on the websites, the enormous investment of public money put in by governments for delivering e-government services will not attain its objectives (Alshawi and Alalwany 2009).

Not limited to e-governance, rather a need to develop customized set of ethics for all e-activities like e-retailing, e-banking, e-mail, etc., is a need of the hour. The corporations and all business ventures have to provide promising and correct information to their customers. Study by Kuo et al. (2015) on hotel website content reveals that misleading photos of a hotel damage the brand trust and consumers experienced greater anger and regret. Hence, a website may be one of the most important factors in building up image, but it is more than just having a website, instead it is the integration of what information is available and how correct is it.

## Content Scraping

Scraping content, also known as *content harvesting* or *data extraction,* is grabbing content from different places on the web and reproducing it on your own site or blog without due permission or acknowledgment. If content is copyrighted then it is taken as copyright infringement, except there is a license or authorization relaxing the copyright. There are many sites over the Internet that contain parts of other websites or stolen content and publish them as if they were their own.

Scraper is who collects copyrighted content and is considered under the violation of the law. Scraping can produce problems for the person or business who owns the content. Scraping is mainly worrisome activity for celebrities or business owners who pay for the content and scrapers reproduce an entire post from an independent or business website. However, most scrapers duplicate only a portion of the content which is keyword relevant to their website. Furthermore, stolen or scraped content can appear on factually any type of splog or RSS-fed junk site. This means a content creator could find their creative, original, or copyrighted content reproduced onto a site sponsoring pornography or similar type of

content that might be offensive to the original creator or author and his/her audience thus may be harmful to the original author's reputations.

## Content Spun

Any content which is not originally crafted by the website author rather a rewriting of existing content, replacing specific information, or using a part of someone's information and presenting it as one's own original work is called content spun. It creates a deception of new content from existing content.

The unethical element in content spun includes dishonesty, trickery, and providing no additional value for readers.

## Content Farming

Over the web community, a content farm also known as *content mill* is a business that pays large sum of freelance writers to produce large quantities of written content which is precisely designed for maximum retrieval by automated search engines. Their main aim is to generate marketing revenue through attracting reader page citation. This area of discussion was initially revealed in the background of social spam.

Ethical concern in content farm allege that content farms provide comparatively low-quality content, and that they exploit profit by producing *just good enough* content rather than high-quality textual pieces.

Textual pieces are usually composed by human writers rather than automated machines, but they may not be written by an expert in the subjects reported. Some writer working for content farm sites identified and admitted knowing little about the subjects on which they report. Search engines consider content farms problematic, as they bring the user to less applicable or relevant and inferior quality results of the search.

## Content Control

Content control or content filtering is a process of determining what part of the content should be accessible and what content should not be. Such limitations and restraints can be applied at all different levels, for instance governments can apply such controls nationwide; an Internet Service Provider can control content for its users. Content control can also be used by a company or proprietor to its personnel, by educational institutions to its students, by a public organization to its visitors, or by individuals to their personal computer.

Some content control incorporates time control functions that enables parents to set the extent of time that child may spend browsing the Internet or playing games or other activities. The motive of content control, primarily, is to avert access to the content which may believe offensive, obnoxious, or secret.

## Web Data Mining

In the era of non-stop, ever increasing, abundant flow of information over the Internet, data mining offers a process to extract the patterns and knowledge from large amounts of data. Web mining does, however, pose a threat to some important ethical values like privacy and individuality. While raising the apprehensions on respecting and protecting individuality, the study of Van and Royakkers (2004) emphasizes the need of handling unethical behavior concerning web data mining should be taken as a joint responsibility shared by web miners (both adopters and developers), web users, and governments.

## Internet Censorship

Interference of government in utilizing or encouraging content-control is an element of Internet Censorship. China is one of an existing example where ethically argumentative activity; Internet censorship, is suspected to exist very strongly. Another example is Cuba where if a web surfer attempts to access information or types a word that is not permitted, the word processor or browser automatically closes, and a *state security* warning pops out because such action is considered to be anti-state.

On ethical and moral grounds many would condemn of Internet censorship because they believe it could become support for misinformation and propaganda, it prevents the censor topic from being discussed that makes activity counterproductive. Censorship is often used to impose moral values on society, therefore English novelist E. M. Forster opposed censoring material on the grounds that it was obscene or immoral, raising the issue of moral subjectivity and the constant changing moral values.

## Internet Surveillance

Internet surveillance is the monitoring of activities performed over Internet such as data stored on clouds or data being transferred over Internet through emails, blogs, social media websites, etc.

However, there is a strong criticism by civil rights and privacy groups and they express concern that with increasing surveillance of citizens over the Internet we will end up in limiting political and/or personal freedom. Hacktivists group *Anonymous* hacks UK government sites in agitation of what they call *draconian surveillance*. The ethical concerns with Internet surveillance have led to numerous lawsuits.

## Internet Hacking

Internet hacking is a trespassing over others personal domain without permission and collecting private information that would otherwise be inaccessible. It can also be used to disable or mess up targeted sites or steal bank accounts. Internet hacking is a cybercrime, but the ethical challenge for developers and publishers is to form a reliable protective Internet domain, and the Internet users have to be conscious of what to share or what not to share over the Internet.

## Spyware

To control hacking, the real challenge appears in fighting against spywares. Spyware, adware, system monitors, tracking cookies, Trojans, are a software that gathers information about a person or organization without their consent. Consumers' information is collected and sold to other companies is an example of nonethical behavior through spywares.

## Conclusion

As a member of web community whether in role of a publisher, curator, scrapper, website honor, blogger, podcaster, or just a social media participant, you are an integral part of the wider public knowledge creation, discussion, and control. Therefore it is of paramount importance that all of us realize our roles on web community and take a responsibility to share fair, non-discriminatory, and reasonable content on the net. We must respect facts, realities, heterogeneity of cultures, and opinion of others. Your action to create, disseminate, or control web content is of vital importance therefore it should be a truthful and impartial representation of the topic at hand not only for those who access it today but for those who access it in the distant future. To do so, it is important to draw ethical guidelines for web content development and its publication on websites and then assure the adherence to those guidelines.

# Ethics and Well-Being

Carole L. Jurkiewicz
McCormack College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Happiness; Health; Prosperity; Weal

## Definition

Well-being is the degree to which individuals report being happy with their life in general, satisfied with their current circumstances, and are healthy in mind and body.

## Introduction

Ethical leader and organizational behavior have long been connected in the literature with employee job satisfaction, loyalty, and higher levels of productivity and efficiency. More recent research has extended this inquiry to the impact of leader and organizational ethicality on the broader conception of employee well-being. It has become clearly evident from a wide range of interdisciplinary research that ethical behavior, policies, and practices are associated with healthy and happy employees as well as financially strong and progressive organizations across all sectors. This monograph discusses the link between ethics and well-being in the workplace.

## Overview

Research has widely substantiated that feelings of well-being are resultant of specific aspects of organizational ethicality, such as effectively developed and enforced ethical codes, ongoing ethics training that involves employees in the learning process, and an organizational mission that articulates a commitment to social responsibility and sustainability (Valentine 2014). Further, leader ethicality has been associated with greater organizational and individual value congruence, higher motivation and productivity, enhanced loyalty and reduced turnover, and less unhealthy conflict and misconduct, and greater creativity (Jurkiewicz 2012a). Strong leader commitment to organizational ethicality through both words and deeds increases ethicality organization-wide and leads to greater levels of job satisfaction.

Conversely, recent research (Giacalone et al. 2016) has shown that unethical organizational practices lead to equally power negative impacts on well-being, not only to the employee him or herself but also to their circle of family and friends as well as witnesses to the unethical events. Such events have a measurable detrimental effect on these individuals' psychological, emotional, intellectual, and physical health, and lead to further instances of organizational injustice, racial and sexual harassment, discriminatory behaviors, abusive supervision and general lack of civility, and bullying (Jurkiewicz 2016).

The literature on well-being has documented that individual beliefs and values can moderate the negative impact of unethical behavior on well-being, meaning some individuals would experience more or fewer symptoms of greater or lesser strength, depending upon their personal value systems. Additionally, three other individual orientations have been shown to predict susceptibility to harm on well-being in the presence of unethical behavior: political values, a belief that the world is a just place, and relative value of materialism.

## Political Values

Individuals who identify themselves as politically conservative were affected to a lesser degree by unethical leader and organizational behaviors. Individuals who self-identified as liberal were more susceptible to harms from experiencing or witnessing unethical behaviors, and reported more negative psychological and physiological damage from such experiences than did conservatives.

## Belief in a Just World

Individuals who believe the world is essentially just and fair had a greater sense of well-being and reported higher levels of self-esteem than those who did not see the world in that manner. The believers were less likely to suffer the negative impacts of unethical behavior in the workplace or experienced them to lesser degrees than non-believers in a just world. They perceived less stress in life in general, had fewer health complaints, and had developed adaptable behaviors to increase their health overall.

## Materialistic Values

Those individuals who place a high value on materialism, money, and the accumulation of goods have been strongly associated with a baseline orientation toward negative well-being. Materialism has been firmly associated with high reports of physical and psychological symptoms, such as anxiety, depression, and overuse of drugs and alcohol. Additionally, these individuals report higher incidents of conflict between work and family, lower quality of life overall, and less energy, and are affected to a greater degree by unethical leader and organizational behaviors than are those individuals who place lower value on materialism.

In summary, those most impervious to unethical behavior and events in the workplace, and who sustain higher levels of well-being in the face of such events, are those who are politically conservative, believe the world is a fair and just place overall, and who place less emphasis and importance on materialism.

Given that employee well-being has clear and pronounced benefits for both themselves and for the organization, as detailed above, what are the characteristics of an ethical organization that lead to employee well-being? Some would assert it's an organization that follows the law, but that is considered the lowest measure of ethicality and one that shifts over time with legislation and social movements. Ethical codes in and of themselves don't create ethical organizations, although the process by which they are developed, communicated, and reinforced does have a positive impact. Group consensus is a very risky measure as common processes such as selective perception, group pressure, affiliative need, and a halo/horns bias impact such a vote and often lead it to irrational outcomes rather than true precepts.

What can be useful is a rubric for evaluating organizational ethicality and the attendant discernible behaviors that comprise it, and defining if the organization frames those activities within a structure of accountability that increases the likelihood that such behaviors will be instituted. Such a model would include a two-tier orientation focusing on both leader behaviors and organizational actions. A leader sets the standard for behavior in an organization and the processes, policies, reward systems, and decisions on ethicality all emanate from him or her (Jurkiewicz 2012a). An ethical leader will not be found at the top of an unethical organization, and vice-versa. Whether through conscious action or subliminal compliance, the employee generally realigns their behavior to match the expectations of the leader or will leave the organization if that is possible.

The *Leader Ethicality Checklist* (Table 1) is presented here as a tool to measure leader ethicality through their observable actions and intents. Inherent in the Checklist is the ability to assess whether the leader's actions and decisions are ethical unto themselves, and whether they contribute to general organizational ethicality. If the answers are confirmatory, it can be presumed with assurance that the leader's behaviors and decisions sufficiently contribute to an ethical organization that will advance individual feelings of well-being, with the heretofore stated concomitant benefits.

Organizational ethicality is demonstrated through the policies, processes, and practices leaders directly influence; Table 2 provides a checklist of *Indicators of Organizational Ethicality*. The most essential indicators are those that focus upon long-term outcomes, take into consideration the full range of affected parties, demonstrate consideration and an analysis of possible consequences, and pursue the best possible solution for involved. Openness to differing opinions,

**Ethics and Well-Being, Table 1** Leader ethicality checklist

| |
|---|
| *Egoism*: Is my judgement on behalf of the organization clouded by perceived opportunities for personal gain? Would I make the same decision regardless of any benefit I may receive from the outcome? |
| *Justice*: Are others' dignity and liberty preserved and enhanced by my decision? Are the opportunities of those involved expanded or abridged? |
| *Principles*: Is my decision or action consistent with my espoused principles? Are my choices consistent with the highest values to which organizations in general should aspire? Do they violate the spirit of any organizational policies or laws? |
| *Rights*: Do my actions give full consideration to the rights, welfare, and advancement of minorities and other less visible individuals? Do my decisions benefit only those with influence but without necessary merit? |
| *Social contract*: Do my actions and decisions advance the social contract? Do they facilitate pride in the individuals affected by my actions, both inside and external to the organization? |
| *Transparency*: Would I be embarrassed if my decision became a headline in the local newspaper? Would I feel confident in justifying my actions or decisions to my colleagues, subordinates, stakeholders, and the public? |
| *Utility*: Does my action or decision lead to the greatest good for the greatest number or the least harm to the fewest? Can any unavoidable harmful effects be mitigated? |
| *Universilizability*: Would I want to be treated in the same manner this decision treats others? |

Adapted from Jurkiewicz and Giacalone (2015)

**Ethics and Well-Being, Table 2** Indicators of organizational ethicality

| |
|---|
| Employee management |
| Actively and fairly rewards ethical behavior and punishes unethical behavior |
| Address hypothetical and actual ethical dilemmas regularly in meetings and training sessions |
| All employees are held to the same standards of moral conduct, there is an absence of favoritism |
| Communication is straight-forward and clear in accessible and verifiable language; employees and stakeholders feel honestly informed, gossip and rumor are nominal |
| Employees feel empowered and supported |
| Exhibits a culture of trust and commitment in interactions with employees |
| Low employee turnover and absenteeism, many qualified applicants for advertised positions |
| Resources and opportunities are equitably distributed, inside and outside the organization |
| Respects and encourages diverse opinions and viewpoints |
| Responds to claims of wrong-doing with respect, in a timely manner, and with transparency |
| Stakeholder and employee surveys express the belief that those associated with the organization are treated respectfully and feel valued |
| Policies and procedures |
| An ethics crisis management plan with accountability at the highest levels |
| Demonstrates through policies and programs those values that are consistent with what the organization espouses |
| Implements systems to identify, prevent, and minimize harmful behaviors |
| Meets and exceeds legal requirements |
| Transparent policies and practices |
| Training, promotions, and awards tied to ethical performance |

Adapted from Jurkiewicz (2012)

flexibility, emotional intelligence, and the extent to which political gamesmanship is diminished as an influencer of decisions are supplementary factors in assessing organizational ethics. Additionally, subordinate loyalty, a reputation of trustworthiness, organizational transparency, fair and objective complaint resolution, and the confidence demonstrated by the public in the organization as well as its leadership are other strong indicators (Jurkiewicz 2012b) of organizational ethicality. An ethical organization would demonstrate most if not all of these

features and would endeavor to succeed at the remaining factors.

## Conclusion

As presented here, leader and organizational ethicality can be measured, and such measures can be correlated with a variety of measures of employee well-being, encompassing physiological, psychological, emotional, and intellectual health. Research has widely substantiated that feelings of well-being are resultant of either ethical or unethical aspects of organizational ethicality. Two checklists provided here provide a starting a point to measure the prevalence of each. Effectively developed and enforced ethical codes, ongoing ethics training that involves employees in the learning process, and an organizational mission that articulates a commitment to social responsibility and sustainability have all been shown to positively affect employee well-being. Further, leader ethicality has been associated with greater organizational and individual value congruence, higher motivation and productivity, enhanced loyalty and reduced turnover, and less unhealthy conflict and misconduct, and greater creativity, all of which also contribute to aspects of employee well-being. Strong leader commitment to organizational ethicality through both words and deeds increases ethicality organization-wide, and in turn strongly affects employee well-being.

# Ethics Exemplars

Richard T. Green
Department of Political Science, University of Utah, Salt Lake City, UT, USA

## Synonyms

Administrative Responsibility; Legitimacy of Administrative State; Normative theory; Public ethics; Regime values

In an insightful chapter on moral exemplars, David K. Hart (1992, pp. 9–29) explained why they are needed and that it is important to distinguish among different types (For example, he distinguished between "moral heroes" and "moral workers."). Joining a long tradition of political philosophy, he argued that "a good and free society cannot long exist without *visible* exemplars of moral courage, fidelity, and trustworthiness" (pp. 10–11). Even the American founding fathers, who emphasized above all the need for checks and balances in government to protect against abuses of power, still maintained the necessity of public virtue to sustaining a democratic republic. That said, Hart noted the tendency in modern society to focus too narrowly on "dramatic times and heroic actions, citing them as paradigmatic examples for all." He wanted to emphasize that "if people are to live worthy lives, then morality must be more than episodic and dependent upon dramatic events" (p. 21). (For a more current treatment of this point, see Newswander 2012). One must cultivate habits and distinguish moral cases as a matter of routine in one's work and life. To this end, he distinguished between "moral episodes" and "moral

processes" (pp. 21–25), with the latter emphasizing routine moral work that receives little or no recognition for what it is but is nevertheless vital to the maintenance of public and organizational integrity.

Conducting moral work entails inculcation of standards and values appropriate to the milieu within which such work takes place, and this is where the work of Professor John Rohr is seminal. Rohr committed much of his life and career to what Hart calls a "moral project" that would help improve the moral quality of American public administration. Rohr focused his efforts on explicating the nature of the values and responsibilities he saw as inherent to US public office, and specifically for career public administrators who are typically subordinate to elected authorities. As such, Rohr saw his work as helping to define our sense of *public* ethics as distinguished from social or private ethics. Rohr did not press this distinction as absolute. Rather these spheres do overlap, with each informing the other to some extent, and yet tensions between the demands of each are often manifested in daily public life. Part of the ethical struggle and nuance of public life entails the maintenance rather than resolution of these tensions in one direction or another (for more on this point, see Green 2012). As importantly, he stressed the maintenance of tensions and ambiguities inherent among competing *public* values as perhaps the most important task of public administrators in contributing to our conceptions of *public integrity*. Integrity carries with it the idea of holding tensions among particular virtues (or "excellences") in balance.

Professor Rohr passed away in 2011 due to complications of Parkinson's disease. [John Rohr died on August 10, 2011, after suffering with Parkinson's disease for about 10 years. He is survived by his wife of 39 years, Kathleen Rohr (nee Lehman) and two sons, Paul and Mark. Kathy is a retired materials engineer, chemist, and educator. She met and married John in 1972. At the time of this writing, Paul (born 1973) works in Facilities Services at Virginia Tech, Blacksburg VA, and Mark (born 1976) is a lawyer for RE/MAX, LLC in Denver CO]. His loss was widely noted and lamented in the field. He was a leading figure in the field of public ethics, specifically addressing the ethical foundations of public administration. He made major scholarly contributions to this emerging field over a 40-year career, helping to develop many of the key dimensions and concepts that would define the field. He was most noted for (1) articulating a theory of public administrative responsibility and ethics based in American "regime values" and (2) explicating a normative grounding for American public administration in the US Constitution. His work was seminal in the formation of ethics curricula for Master of Public Administration programs around the country. His body of published work is extensive, including 7 books, 38 book chapters, and 50 journal articles (Rohr's books are as follows: *Civil Servants and Their Constitutions* (Lawrence, KS: University Press of Kansas, 2002); *Public Service, Ethics and Constitutional Practice* (Lawrence, KS: University Press of Kansas, 1998); *Founding Republics in France and America: A Study in Constitutional Governance* (Lawrence, KS: University Press of Kansas, 1995); *The President and the Public Administration* (Washington, D.C.: American Historical Association, 1989); *To Run A Constitution: The Legitimacy of the Administrative State* (Lawrence, KS: University Press of Kansas, 1986); *Ethics for Bureaucrats: An Essay on Law and Values* (New York: Marcel Dekker, Inc., 1978b; 2nd ed. 1989); *Prophets Without Honor: Public Policy and the Selective Conscientious Objector* (Nashville: Abingdon Press, 1971).) This article first reviews the background and training which gave shape to Professor Rohr's thinking about public ethics and then summarizes the essential features of his work.

## Early Career

Rohr entered the Jesuit seminary at Loyola University in Chicago in 1952. There he earned his A.B.. in 1957, the Ph.L. in 1959, and then M.A. and S.T.L. degrees (all in theology and philosophy) at Georgetown University in 1964 and 1966. He was ordained in 1965. During those years, he taught high-school Greek and

Latin, and college courses on church-state relations, American government, and constitutional law at Georgetown University. He studied church-state relations under the renowned Catholic theologian, John Courtney Murray, at the Woodstock College of Georgetown University during the years of the second Vatican Council (1962–65) in which Murray played an influential role.

Murray's thought informed Rohr's "constitutional-juridical" view of the state which he and Murray saw as "a corollary of limited government; it declares civil authority incompetent in certain areas (e.g., religious truth) and is satisfied if government protects those processes that guarantee freedom of thought and expression" in general (Rohr 1966, p. 148). This implies the existence of a "broader spectrum of liberties" which embrace and support human dignity and which are more typically associated with democracy established through a limiting Constitution (Rohr 1978a, pp. 18–19). Rohr was further influenced by Murray's distinction between state and society, wherein the state is confined to matters of "the public order" which is a subset of the broader common good. The common good is determined by a variety of social as well as state institutions (1978a, p. 18). These ideas were buttressed in many respects by the works of Thomistic scholars, Jacques Maritain (cf., *Man & the State* 1951) and Yves R. Simon (cf., *Philosophy of Democratic Government* 1951), and they influenced much of Rohr's subsequent work.

In the fall of 1965, Rohr entered the Ph.D. program in Political Science at the University of Chicago where he studied under many distinguished faculty, but especially Leo Strauss, Joseph Cropsey, and Herbert Storing. Rohr (along with colleagues such as David Rosenbloom, Douglas Morgan, Kent Kirwan, and David Schaefer) gravitated to Storing's focus on constitutional history and law and was profoundly influenced by his exhaustive study of the Anti-Federalists. The nature of Rohr's theological and philosophical training drew him to the intersection of political and juridical principles in the situated and evolving historical contexts of particular regimes. This "regime" focus is replete throughout both Storing's and Rohr's published works.

Storing's analysis of the Founding-era debates emphasized that while the founders "agreed that the purpose of government was to protect rights" and that "liberty could not be assumed to result simply from the election of government officials by popular vote," they could not agree on "how these rights could best be secured (Storing 1981, p. 1:6; Morgan et al. 2010, p. 622)." Thus, their constitutional work remained unfinished, leaving subsequent generations to wrestle with the conundrums they enshrined. This critical observation led Storing to concentrate on the political role of public administration in American governance, in contrast to the prevailing idea born in the Progressive era that politics and administration were separate endeavors involving different kinds of questions and methods. (For a succinct description of the debate between Storing's conception of American public administration versus the rational-scientific approach to the subject, see Morgan et al. 2010, pp. 621–633.) Rohr carried this project forward in his groundbreaking work on "regime values" as a foundation for public administrative ethics and on a constitutional theory of American public administration.

## Career in Public Administration

Rohr's years in the Ph.D. program at the University of Chicago marked a dramatic turn in his life and career. As a Ph.D. student at the University of Chicago, he became a commissioned officer in the US Naval Reserve and taught summer courses at the US Naval Schools Command in Rhode Island. Initially he also served as a Chaplain, and then later became a Public Affairs Officer (he would retire at the rank of Commander in 1991). During this same period, Rohr, like many other Catholic priests, agonized over whether to stay in the order given the context of so many changes occurring in the priesthood and church after Vatican II. He finally decided to leave in 1970, the year he received his Ph.D. and was granted a formal release from his vows by the Vatican in 1971. In that year, he joined the faculty at Governors State

University in Park Forest South, Illinois, where he remained until 1979. He also served as Associate Director of the General Management Training Center in the US Civil Service Commission, Washington, D.C., through a NASPAA Fellowship in the years 1975–1976.

Rohr was hired into a new Center for Public Administration and Policy at Virginia Tech by Gary Wamsley in 1979. Wamsley brought together a cast of up-and-coming scholars in the field of public administration (among them, Philip Kronenberg, Charles Goodsell, Orion White, John Dickey, and James and Linda Wolf), with Rohr adding ethics, law, and administrative responsibility to a diverse and demanding doctoral curriculum. The Center taught doctoral students exclusively until the late 1980s, when it added the MPA degree program. Rohr stayed with the center at Virginia Tech for the remainder of his career, leaving only for a 9-month period in 1990 to study the role of public administration in France on a Fulbright fellowship.

Rohr had published his seminal book, *Ethics for Bureaucrats: An Essay on Law and Values* (1978a), and joined a group of scholars around the country (early among them were Terry Cooper, Ralph Chandler, James Bowman, Herman Mertins, David K. Hart, Kathryn Denhardt, and Don Mensel) who advocated inclusion of ethics as a core topic in the field. They became founding members of the Ethics Section of the American Society for Public Administration (ASPA). The group developed a substantial literature on the subject for the field, and Rohr's work figured prominently.

## Regime Values in Public Administration

In *Ethics for Bureaucrats*, Rohr provided both a normative grounding and a method for cultivating ethical competency in public administration that are distinctively public and based in formal administrative roles. In doing so, he distinguished public administrative ethics from broader ethical concerns based in political philosophy, humanistic psychology, and common decency. Although these are important and relevant sources of ethical insight, they do not focus specifically on *public* obligations which should provide the basis for exercising administrative discretion (Rohr 1978b, Chapter 2). For Rohr, it is the fact that American public administrators are delegated significant discretionary powers in a constitutional republic that obliges them to ground their decisions in public or "regime" values. Furthermore, because public administrators exercise delegated power, their roles are inherently political. They are no mere clerks or agents operating in servile deference to their superiors. Rather, they participate fully in governing the polity through offices which must balance subordinate status with significant degrees of autonomy. This of course differs radically from the conventional role prescribed for public administrators by those who insist that administrative work should be purely instrumental in nature and wholly subservient to the will of the people only as expressed through their elected public officials.

Rohr's regime values method rests on the following premises: (1) "That ethical norms should be derived from the salient values of the regime"; (2) "that these values are normative for bureaucrats [emphasis original] because they have taken an oath to uphold the regime"; and (3) "that these values can be discovered in the public law of the regime" (Rohr 1978b, 2nd ed. 1989, p. 68). In adopting these premises, one narrows the range of ethical questions and values to those legitimately conferred upon a limited government. Public servants do not have license to address any matters they choose. They are confined to those which fall within their legally prescribed roles. As Rohr described it, "…professional education necessarily involves a canon of selectivity appropriate to its peculiar goals even at the expense of ignoring questions that may be inherently more interesting and important" (p. 69). This thinking reinforces the distinction Rohr and his mentors made between state and society. The politics of the state must not subsume all spheres of life in civil society. Nevertheless, the reach of public law is still very broad, and Rohr's approach to it was certainly not positivistic. He did not view law simply as commands of a sovereign backed by force, but as a forum in which values and

legitimating sources of authority are elicited more through ongoing discussion and debate rather than through unilateral assertion. Few policy decisions stay settled for very long in such a regime.

Values such as liberty, equality, and property run to the heart of American life, but they are also inherently ambiguous in their meanings, and subject to tension in their application to public policy. So too are conceptions of "the people" as the ultimate source of sovereignty. Are the people of American democracy simply the current generation or should the thought and actions of past generations, and the concern for future generations, figure into the mix? Rohr included past generations as a source of insight, as well as for lending evidence to the enduring quality to those "beliefs, passions, and principles" (p. 74) that we deem eligible as regime values. He included future generations because the Constitution was established in part to "secure the blessings of liberty to ourselves and our posterity" (Preamble, emphasis mine). To Rohr's way of thinking, the American Constitution provides an essential though flawed framework of structures and values through which to carry on our unresolved debates about how to govern wisely in pursuit of those values. In this sense, the people exercise their sovereignty and mediate their values through their federal and state constitutions as well as through the bodies of law which derive from or are grafted into them. The laws therefore offer a potentially rich and practical source of insight that public officials can use to identify salient values and also find meaningful statements about them.

For Rohr, the courts, and especially the US Supreme Court provide an ideal source of meaningful statements about regime values. He did not treat them as the exclusive source of such insight. Any source in the legal fabric of society might qualify, but the most ideal sources need to meet four characteristics. First, they need to be "institutional" in the sense that opinions, arguments, and judgments about the meaning and significance of particular values are tested in some venue over time. For example,

> The nature of the judicial process involves a tension between past and present. Courts frequently solve current issues with a creative interpretation of a familiar principle. This enables a political society to address new problems without sacrificing the stability and continuity that come from invoking familiar principles. In a word, the Court is a contemporary institution in dialogue with its past. (Rohr 1989, p. 78)

Institutions are repositories of such insight and can help "bureaucrats distinguish between stable principles and passing whims" (p. 77) and "avoid becoming imprisoned by their own historical circumstances" (p. 78).

Second, the most valuable sources of insight should be "dialectic" in nature. They should be subject to ongoing debate, and court opinions provide "a highly structured and formal context" for such arguments. Rather than looking strictly to the black letter law – that part of an opinion deemed by lawyers to be the legally binding essence of decision in a case – bureaucrats can examine the dicta of the judges "own views on the nature of a just American society" (p. 79). The arguments pro and con on the issues in the case can therefore "be quite instructive for the bureaucrat seeking enlightenment on the meaning of American values" (p. 79), and one may often find as much or more insight in the concurring and dissenting opinions than in the ruling opinion of the day. Rohr's points here clearly envision bureaucrats forming and exercising judgments of their own about the application of such values, not as lawyers do, but in their policy determining and implementing roles. Lawyers and judges are not the only officials who have something to say about what the law means. Rohr did not want to turn bureaucrats into lawyers, but rather to help them gain ethical insight about the use of their significant discretionary powers as governing officials per se. There are many academics as well as practitioners who recoil at this bold description of bureaucrats' roles, and yet in study after study of bureaucratic behavior we see bureaucrats exercising such powers. Rohr wanted them to do so responsibly.

Third, sources of insight about regime values should be "concrete" in the sense that they must be applied to real-world circumstances. "A justice may soar to the highest abstractions in discussing such lofty generalities as due process of law, but

eventually he must decide whether the confession was admissible or the book obscene or the statement libelous" (p. 81). Bureaucrats, like judges, are "disciplined by reality" (p. 81) and this has a tempering effect on their reasoning. They must combine theory with action in a way that makes "rule by law" meaningful.

Finally, sources of insight on regime values are necessarily "pertinent" in that they dwell on issues that matter to people. Rohr here refers to the classic insight of de Tocqueville who observed the "tendency of Americans to transform major political problems into legal issues." This historic tendency gives added relevance to our laws as sources of much more than mere legal order. The laws embody our public disputes and priorities not as rigid orthodoxy (as some might wish) but more as evolving public argument about the things that matter most to us in public life. In the remaining chapters of *Ethics for Bureaucrats*, Rohr illustrated the evolution of meaning in the Supreme Court's arguments about liberty, equality, and property as manifested in a lineage of cases that have shaped and reshaped public policy over two centuries. He emphasized that these were not the only values that count as regime values but used them because they clearly run through the heart of American life.

Rohr's project in *Ethics for Bureaucrats* was incomplete because it did not deal with the much broader issue of the place of the administrative state in the American constitutional system. The founders could hardly have anticipated the existence of the vast complex of administrative agencies exercising many of the powers and functions of the superior branches of government on behalf of a crowded continent of people. The modern American administrative state has continually been subject to challenge as an illegitimate manifestation – as a "fourth branch" – of American constitutional government. This impression is strengthened and confused further by reformers (politicians and academics among them) who have conceived the relation of politics and administration through a simplistic and expedient formula that does not fit well in the American constitutional schema. That formula treats politics and administration as separate *functions* (rather than *powers)* of government (cf., Wilson 1887; Goodnow 1900). According to this view, politics is the expression of the will of the people through their political parties and elected representatives. Politics therefore has to do with questions of *what* should be done, and *why*, through the public policy making process. Administration is the execution of the will of the people as expressed through these political bodies. It deals primarily with questions of *how* public policy should be carried out. It is uniquely the province of executive officials to carry out the administrative *function*. Thus, all administrative functions are equated with the executive and with the courts which are treated as dispute-resolving adjuncts to the executive.

This tidy distinction between politics and administration as separate functions is buttressed when administration is presented as an art being rapidly transformed into a science (cf., White 1926.) The idea of an administrative science was employed by Progressive era reformers as an expedient way of expelling partisan politics from administrative work – a much needed reform in an era marked by rampant partisan corruption and intrigue in the public administration at all levels. However, the conception of administration as science inevitably congers the image of administration as separate from politics in general. Administration as science is an *apolitical* endeavor, thus sharing more in common with business administration than with the politics of public governance. The Progressives became enthused with the idea of running government like a business, and it remains a popular mantra to this day. One great irony resulting from this conception of administration is that it focuses the public mind on partisan politics as if it were the only legitimate type of politics in a democracy. Any other kind of politics, such as interest-group politics, judicial politics, and most certainly bureaucratic politics are often seen as illegitimate aberrations.

Rohr explored the history of these ideas in relation to the founders' designs for the Constitution, and through that analysis developed a sophisticated argument for reconciling the administrative state with constitutional principles.

## Rohr's Constitutional Theory of Public Administration

In his seminal work, *To Run a Constitution: The Legitimacy of the Administrative State* (1986), Rohr derived an elaborate theory of administrative responsibility from the logic of the American constitutional system. (Parts of the narrative in this section is taken from Morgan et al. 2013, pp. 137–141). The theory justifies robust discretionary roles that require career officials to govern in a similar though narrower fashion to their superiors. Rohr begins with the relaxed, pragmatic view of separation of powers held by the designers of the Constitution, and then draws out the political and ethical responsibilities inherent to this design.

### Partial Agency

In his analysis, Rohr finds that the framers of the Constitution were very pragmatic about blending powers among the branches of government. They believed that the danger of tyranny existed when one branch was capable of usurping the *whole* power of another branch (cf., Federalist essay 47). That would upset the constitutional balance of powers and thereby subvert the system. However, they also understood that a *partial blending* of the powers would be necessary to make the government work at all. James Madison provided the mechanism that met both concerns. In *The Federalist Essays*, he explained how each branch must enjoy "partial agency" in the powers of the other branches. That is, each branch should possess some of the powers of the other branches in order to prevent encroachment and yet permit cooperation among the branches for the sake of governing effectively (see Federalist essays 47 and 48).

Many provisions in the Constitution establish checks and balances through mechanisms of partial agency. The president, for example, enjoys legislative power through the veto clause. He can veto any attempt by Congress to infringe on executive powers and may also use it to induce cooperation on the substance of bills. Likewise, the US Senate exercises executive power through the advice-and-consent clauses on appointments and treaties and serves as a judicial body to try impeachments of the president. These powers can obviously be used as checks on the executive branch, but they also enable the branches to join forces on vitally important matters. Rohr used the clauses on the Senate as textual evidence that the "framers were quite willing to place all three powers of government in one institution where circumstances so required" (1986, p. 18).

During the first years under the new Constitution, members of the three branches demonstrated a relaxed attitude about the mingling of powers for specific purposes. For example, in the creation of the Sinking Fund (a fund used to retire national debt), the first Congress established a governing board composed of the chief justice of the US Supreme Court, the president of the Senate, the secretary of the treasury, the secretary of state, and the attorney general. As Rohr indicates, Congress was also willing to conduct investigations through committees that included congressional representatives, executive officers such as the secretary of war, and inferior or subordinate officials (p. 27). So too did President Washington request assistance in executive matters from circuit-riding judges (p. 26).

Moreover, Congress willingly combined powers in subordinate agencies for limited purposes. The Treasury Act of 1789 conferred significant discretion on the secretary of the treasury, permitting exercise of quasi-legislative and quasi-judicial powers in treasury-related and customs-house operations (Green 2002). The first Congress clearly intended to co-manage the US Department of the Treasury with the executive branch, and the treasury would, by extension, exercise the powers of all three branches in confined spheres of policy and practice.

Today, the combination of legislative, executive, and judicial powers in public agencies for limited purposes is commonplace, and Rohr's analysis shows that the logic of the Constitution both permits and legitimates this practice. Other scholars, especially Philip Cooper (cf., 1988) and David Rosenbloom (cf., 2000), give rich descriptions of how the political values and practices of the courts and of Congress are fused to the operations of administrative agencies at all levels.

Their studies clearly demonstrate that administrative work is neither exclusively executive nor merely instrumental in character. Rather, administration reflects the values, methods, and character of all three branches (cf. Rosenbloom and Kravchuk 2005). This reality creates tensions that administrators must hold in a rough balance. If they fail to do so they may eventually have correctives imposed on them. For example, Philip Cooper (1988) illustrates how federal district courts have imposed "remedial orders" on state and local agencies to protect rights and improve services. This reminds administrators that they are *subordinates* in the governing system and as such must try to understand and apply the perspectives of superiors from all three branches (Cooper 1988, p. 350). At critical points, however, Rohr observes that they must also choose sides with one branch or another.

### Public Administration as Balancewheel

Rohr's theory of administrative responsibility obligates public administrators to serve as a balancewheel among the superior branches of government. This means career public officials should resist actions by any superior branch of government that threatens the balance of powers among all three. Thus, Rohr emphasizes institutional obligations first, but these responsibilities entail significant discretionary power because the logic of our constitutional system demands it. Bureaucrats are politicians in their own right, with a legitimate and distinctive constitutional role to fulfill. That role includes choosing sides with different branches for varying purposes, which means they cannot be the sole instrument of any single branch. If they are instruments at all, they are "instruments of the Constitution" (1986, p. 89).

This is a profound theory because it justifies significant degrees of institutional and professional autonomy for the public administration. It therefore also provides a rationale for separating public administration from partisan politics. Without a meaningful degree of separation from partisan influence, bureaucrats could hardly resist partisan measures that threaten the balance of powers among the branches or which pervert agency missions in favor of private or partisan interests. The theory thus embraces the idea that administration has its own political characteristics, borrowed in part from each branch, and melded into the distinct organizational politics of public agencies. It recognizes the reality of bureaucratic politics and provides a normative grounding which can be used to guide and channel political action.

### Constitutional Defects and a Refortified Executive

Rohr strengthens his case for a robust yet limited autonomy in the public administration by showing how the modern administrative state compensates for defects in the constitutional design. First he describes how the Senate failed in its design as an "executive establishment." The founding debates on the Senate reveal that it was intended to serve not only as a representative body but also as a vitally important executive institution. Key provisions in the Constitution give the Senate a share in executive powers. For example, through the advice-and-consent clauses in Article II, section 2, it shares power with the president in appointing high officials and in ratifying treaties with foreign powers. Senators serve longer terms (6 years) in part to gain more expert knowledge and lend stability to the executive branch. Both Federalists and Anti-Federalists agreed that the Senate must become a "permanent body constantly in session" in order to collaborate with the executive in complex policy development and in emergency conditions such as wars and depressions (Rohr 1986, p. 35).

The Senate's role as an executive body, however, failed to materialize. Very early in its history, the Senate reverted to its role "almost exclusively as a second legislative chamber" (Rohr 1986, p. 39). Interbranch jealousy of power, partisan differences, and imperatives to represent state rather than national interests made close collaboration with the executive problematic at best. Formal recognition of this reversion to legislative functions occurred in the ratification of the Seventeenth Amendment in 1916. Subjecting senators to direct popular vote was "a wise and long

overdue recognition of the democratic spirit of the United States" (39), but it also reflected recognition of constitutional failure. Rohr argued that the creation of the career civil service, especially at the higher echelons, helps compensate for the loss of this senatorial role. Career senior administrators can provide the long duration, stability, and expertise needed for complex policy formulation and implementation.

### Enhancing Representation

The second defect of the original constitutional design involves inadequate representation. Rohr cites criticism, widespread among Anti-Federalist founders, that the constitutional scheme of representation was severely flawed. They believed that "representatives should be close to and resemble the people they represent, but the small number of representatives in the proposed Constitution will make this impossible" (Rohr 1986, p. 41). The Anti-Federalists viewed effective representation as a matter of thinking and feeling as the people think and feel. This required that representatives be numerous enough to reflect the many diverse communities and interests in political society. In effect, they should form a microcosm of the public. The Constitution, providing no more than one representative per 30,000 inhabitants in the House of Representatives, could hardly achieve that standard. Furthermore, the location of House members far away in the nation's capital would cause them to lose touch with those at home. They would inevitably begin to favor more general measures that were less responsive to local constituencies.

Most Federalists, on the other hand, emphasized representation that knows the general nature of regional, state, and community interests, yet remains aloof from them in favor of policies that unify these diverse interests into a public interest. They wanted locally representative voices to be restrained and tempered by concern for broader interests. They intended the bicameral structure of Congress to reflect this desire, with the Senate restraining unduly parochial and prejudicial measures in the House. James Madison's constitutional design reflected a desire to "filter and refine" public sentiments through layers of officials who were in varying degrees insulated from the direct influence of the populace.

These contrasting views of representation have never been reconciled, and neither one has met expectations (Rohr 1986, p. 44). This became evident as the population increased and our politics became more democratic. Today each House member represents on average more than 660,000 people. They can hardly know or sympathize with the incredibly diverse communities and interests in their districts, much less reflect their character and feelings.

Inadequate representation has spawned much political disenchantment in our history, resulting in a number of compensating measures and theories, the most prominent of which is reliance on pluralist philosophy and interest group advocacy. Rohr argued that the emergence of the modern administrative state, with its millions of employees, provides an additional corrective in that it more closely approximates the microcosm envisioned by the Anti-Federalists. He refers to the substantial literature on "representative bureaucracy" in support of his argument. When we examine the demographic makeup of our governmental bureaucracies, "we see our sons and daughters, our brothers and sisters," our neighbors, friends, and acquaintances (Rohr 1986, p. 50). (Note that Rohr concedes that bureaucrats do not perfectly replicate as a microcosm of the broader citizenry. They more closely match the characteristics of the middle class, but this still provides a much broader scope of representation than formally provided for in the Constitution.) They think as we think, and feel as we feel.

This mass of employees, Rohr argues, serves as a bulwark against arbitrary power. They are spread across myriad agencies, special districts, and levels of government that often compete jealously for influence over policy. Studies of bureaucracy show that it more closely resembles a vast interorganizational field of diverse agencies with competing interests than a monolithic edifice (Rohr 1986, Chapter 11). The characteristics of governmental bureaucracies have more in common with the "extended republic" envisioned by Madison and therefore serve to diffuse and check governing power rather than unify it. Bureaucrats

thus contribute to representation in government even though they are not directly elected by the people.

As significantly, direct election is not the sole criterion by which representative legitimacy is conferred under our Constitution. Rohr offers as evidence the fact that the Constitution specifies twenty-two different methods of appointment to office, only one of which is by direct election (p. 185). The variety of appointment methods coincides with Madison's design for a filtered and refined system of competent public officials who would represent the people by pursuing a unifying public interest. In Madison's scheme, all officials under the Constitution share in representation of the people.

Rohr's balance wheel theory, then, identifies four significant and distinctive responsibilities for public administration that meet the spirit, if not the letter, of the American constitutional system:

1. To integrate and exercise all three governing powers for limited purposes
2. To help preserve the balance of powers among the superior branches
3. To bolster and stabilize executive branch operations
4. To enhance political representation by approximating the microcosm desired by the Anti-Federalists

These obligations, arrayed as they are among a vast field of public agencies, make the public administration much more than a mere instrument or agent of policy makers. Their responsibilities require the exercise of both institutional and substantive discretion, which means they participate fully in governing the democratic republic. Career officials balance, complement, stabilize, inform, and extend the governing activities of the superior branches throughout society, and their professionalism helps meet the need for competence and energy.

After explicating the varying intentions of the founders and adapting their constitutional design to the modern conditions of the administrative state, Rohr devotes the remaining sections of the book to the contrasting administrative theories of Woodrow Wilson and Frank Goodnow who contributed to "founding the administrative state in word" and to the New Deal administration of Franklin Delano Roosevelt which "founded the administrative state in deed." As explained earlier, Wilson and Goodnow presented a much simpler conception of government based on the idea of *separation of functions* (and the resulting politics-administration dichotomy) rather than *separation of powers*. Rohr's explication of their work revealed that they believed the American Constitution had become outmoded and that they strongly favored the British parliamentary system. Wilson openly proposed in his early works as a political scientist that the Constitution be modified so that executive cabinet members would also be members of Congress – thus turning it into a parliamentary body with fused rather than separated powers. Goodnow proposed party reforms toward the same end, and in order to create a more unified expression of the will of the people. The reality under our Constitution that one party could control Congress, while the other party controlled the executive was anathema in their eyes. Rohr then contrasted their conception of administration with the administrative philosophy and practice of former Michigan state judge, Thomas Cooley, who exemplified a constitutionally competent chairman of the Interstate Commerce Commission – an "independent" regulatory commission that could not be considered an executive agency and yet was reconcilable in terms of its constitutionality.

In the next section, Rohr illustrated how these Progressive era ideas found their way into the federal government during the New Deal era, principally through the President's Committee on Administrative Management which, at the behest of President Roosevelt, sought to centralize and reorganize the federal public administration into an exclusive province of the executive. It proposed collapsing all independent commissions into the executive branch, centralizing myriad agencies into super departments, establishing a presidential staff, and vesting budgetary and planning control in the presidency. Congress would be consigned to the mere role of policy ratifying body, while the president would become the

"sole" rather than "chief" executive officer of the government. The public administration would become the exclusive province of a "managerial presidency" (Rohr, Chapter 9). Rohr then described the institutional reaction of Congress and the courts to these attempts at executive usurpation and, as importantly, the reaction of the attorney general staff. The Attorney General's Report on Administrative Procedure attempted to integrate the values, competencies, and powers of the legislative and judicial branches into the workings of the administrative agencies. Their efforts succeeded to a significant extent with culmination in the Administrative Procedure Act of 1946. The history of administrative development in the United States continues to reflect the tug and pull of constitutional inter-branch jealousy of power and the expansion of executive prerogatives under the banner of the Progressive's overhead democracy and managerial functionalism. Rohr argued that to the extent we follow the latter model we court political as well as constitutional illegitimacy.

## The Presidency and Public Administration

In a brief monograph published by the American Historical Association in 1989, Rohr addressed in more detail what the founders envisioned relative to the presidency and the public administration. His historical explication clarifies some important differences between what the founders intended for this relationship versus what has evolved as a "managerial presidency" and an instrumental public administration.

Advocates of the managerial presidency today commonly refer to Federalist essay 70 and its defense of "unity in the Executive" under the proposed Constitution as justification for adopting the corporate CEO model in which the president is the "chief executive officer of a tightly organized firm whose subordinate officers are merely instruments of the president's will" (Rohr 1989, p. 10). Rohr responded that this is a mistaken interpretation for several important reasons.

First, although the Constitution does provide for a powerful executive, it also carefully circumscribes and limits those powers. Federalist 70 was written primarily in response to Anti-Federalists who argued that a plural executive would be safer in terms of controlling against undue presidential usurpation of power. Federalist 70 shows why this would be unwise for political purposes by diffusing rather than concentrating accountability. The president would be controlled by many other precautions, including by a due independence in subordinate offices. "Publius' model of administration was more political than managerial" in that "he looked upon heads of the executive departments as legal officers, like the president. Their function was to assist the president in taking care that the laws be faithfully executed; they were not simply to do the president's bidding" (p. 10). The founders also recognized that some heads of departments and subordinate officers had actually preceded the establishment of the presidency, having been appointed under the Articles of Confederation, and that they already enjoyed reputations as "prominent and [even] politically controversial" officials. This remained the case under the new Constitution with such leading lights as Jefferson and Hamilton serving in subordinate cabinet positions. They were hardly the president's instrumental minions, and they certainly did not view themselves as members of a presidential team.

Furthermore, Publius hoped that the Senate "would exercise some control over the President's desire to bring people of his own choosing into the highest positions. Although the first Congress would decide otherwise, Publius thought the Senate's concurrence would be necessary before the president could remove a subordinate from office (see Federalist 77)." The founders in general looked down on servile obedience in administration and shared Publius' condemnation of an executive who would appoint those "whose chief merit is their implicit devotion to his will." Professionalism was preferred over personal loyalty. This contrasts rather sharply with the "spirit of today's constitutional practice, which encourages the president to appoint his own 'team'" (p. 11).

The limited independence of administrative officials is further supported by specific constitutional provisions in Article II which clearly intend that administrative departments be established, leaving to Congress the details of their creation. Thus, the public administration is comprehended and expected in the document, even though the word administration appears nowhere. In this regard, Rohr noted that the Federalist essays, now considered the most authoritative commentary on the Constitution, uses the word administration 124 times "more often than the words *Congress, president, or Supreme Court*" (p. 7). It certainly was prominent in the mind of Publius!

Additional evidence against the idea of a managerial presidency in the founding era is found in the confusing and contentious debates in the first Congress over whether the president should enjoy removal powers over subordinates who are appointed with senatorial approval. Rohr presents a careful exegesis of the debates, which lasted for 5 days and ended only with a tie-breaking vote in favor of presidential removal of the Secretary of Foreign Affairs. The upshot of his analysis is that the founders' extreme ambivalence about this power is reflected in the history of the regime, with presidents often claiming exclusive removal powers, and Congress jealously limiting those powers in important ways. All that can be said today, as characterized by Justice Brandeis' dissent in *Myers v. U.S.* (1926, p. 284), is that the famous "Decision of 1789" involved "merely the decision that the Senate does not, in the absence of a legislative grant thereof, have the right to share in the removal of an officer appointed with its consent; and that the president has, in the absence of restrictive legislation, the constitutional power of removal without such consent." This standard falls far short of claims under the managerial model of the presidency, and thus leaves ample room for appointments with fixed tenure – such as the many commissioners and board members who supervise independent public agencies, not to mention the ranks of "inferior" offices (those not requiring senatorial approval) staffed by a career public service.

The most significant constitutional limit on the presidency over the public administration, however, lies in its tenuous structural relationship with Congress. Rohr devotes an entire chapter to illustrating how the constitutional separation of these two powers "severs the hierarchical chain of command in the executive branch and exposes the subordinate to the full force of Congress's impressive powers to investigate public administration and to subject it to the rigors of legislative oversight" (p. 32). Perhaps the most significant illustration lies in the Supreme Court's unanimous refutation of President Andrew Jackson's claim that Congress could not statutorily direct the powers, obligations, and actions of executive branch subordinates at any level. The executive branch belonged to the president alone, he argued, and this would have firmly established the idea of "overhead democracy" wherein the Congress serves more as a board of directors which must work exclusively through the office of the president. The president would have exclusive control over the public administration. The Supreme Court, in *Kendall v. U.S., ex.rel. Stokes* (1838), flatly rejected this claim, stating that

> . . .it would be an alarming doctrine that Congress cannot impose upon any executive officer any duty they may think proper, which is not repugnant to any rights secured and protected by the Constitution; and in such cases, the duty and responsibility grow out of and are subject to the control of the law, and not to the direction of the President." (p. 610)

Congress has consistently directed through law the discretionary powers and obligations of many subordinate executive officers since the first congress and has often done so as a direct check on presidential power over subordinates. This of course empowers subordinates in their own right, which can lead to "power hungry" manipulation and abuse in administration, but the founders feared more the centralization of power in one branch and were willing to tolerate the potential for dissention and abuse in the ranks in support of a constitutional balancing of powers and rule by law rather than by will. In this constitutional milieu, said Rohr, what "tends to be lost sight of. . .is the extent to which Congress confers power on administrative officers as a tactic in its perennial conflicts with the president" (p. 35). This includes even the power of Congress to

subject the president in some specific situations to seek approval of his plans and actions to a subordinate! This occurred, for example, in 1940 when, by statute, President Roosevelt was forced to submit his plan for supply of American naval destroyers to England to the Chief of naval Operations, Admiral Stark – an officer known to be opposed to giving away American naval assets. Members of Congress who held strong isolationist views insisted on this provision as a check on President Roosevelt's ambition to get involved directly in the war effort (see pp. 35–36). This hardly fits with the managerial model of the presidency and administration.

Congress's power to assign responsibilities and authority to executive branch subordinates ties into the broader matter of congressional delegation of powers (even quasi-legislative powers) to subordinate agencies. Congress has done this routinely throughout US history, despite claims that it cannot delegate its own powers to another. The fear is that Congress would be delegating powers that were expressly ceded to it (and not to others) by the people, and that such delegation could result in the wholesale abdication of its powers, thus unraveling the constitutional separation of powers structure. Rohr illustrates that the long history of congressional delegation demonstrates that this is not the case. Rather, it illustrates further how Congress has used delegation of both interstitial (filling in statutory gaps) and contingent discretion (triggering agency discretion when certain conditions pertain) to subordinate agencies for the purposes of enhancing its own administrative oversight independent of the President. These delegations reflect more the constitutional blending of powers (Madison's "partial agency," see Federalist essay 47) that Madison argued would make separation of powers meaningful but also limited. Each branch must share some of the powers of the other branches in order to stave off attempts by other branches to usurp their powers and to provide for more effective coordination and integration of their powers in administration. Accordingly, the subordinate agencies would share the powers of the superior branches, including limited legislative power in the form of agency rulemaking. Congress would retain a meaningful measure of control through direct oversight of the administrative rulemaking process.

In the only two instances in which the Supreme Court challenged congressional delegations (see *Schecter Poultry v. U.S.* (1935) and *Immigration and Naturalization Service v. Chadha* (1983)), Rohr shows that the court's pronouncements dealt with overly broad delegations (*Schecter*) and with one-house decisions (the so-called "legislative veto") that appeared to violate the "presentments clause" of the Constitution (*Chadha*). Neither case presumed to stop all delegations of Congressional power, and immediately in the wake of these decisions, ways were found by Congress and the agencies to work around the limitations imposed. Congress still grants broad delegation of powers to some agencies (with conditions and subsequent oversight built in) and imposes legislative vetoes in some agency decision-making processes. This constitutes direct supervision of executive as well as non-executive agencies, boards, commissions, and authorities of the US government – a reality not comprehended in a managerial view of the presidency, much less of public administration.

## Rohr's Venture into Comparative Constitutional Administration

In the years following completion of *To Run a Constitution*, Rohr ventured into comparative politics and administration. He wondered "what might happen in a country wherein the normative foundations were the opposite of those in the United States; that is, a country in which administrative institutions embodied the abiding norms while constitutions were unstable" (Rohr 1995, p. xii). France was an obvious choice, having gone through thirteen constitutions since the French revolution of 1789. He later included attention to Canadian and Thai constitutions. The purpose of this work was to "deepen (American students') knowledge of the relationship between constitutionalism and administration. . ." (p. xii) by seeing how the relationship differs in other nations, and thus understanding more about ourselves in the process.

Rohr's analysis focuses on the founding of the fifth (current) Republic in 1958, for which there is a trove of documents as well as a wealth of insights from officials and academics about the operation of the French administration ever since. Rohr's work is, as usual, detailed and incisive and worthy of a thorough read. For purposes of this article, a few examples of the insights he drew from it will suffice to entice further reading.

First, the French administrative state is generally revered in French society. Its civil service system is subject to criticism for its elitism, but as Rohr quoted from a prominent French executive, "Ninety percent of the population want to abolish the *Ecole Polytechnique*, but they all also want their sons to go there" (Rohr 1995, p. 30). The civil service has brought a necessary "stability to France because the political character of the country was notoriously unstable" (p. 30). Of particular significance is the fact that the Council of State, France's grandest corps of high civil servants, supplied the expertise for crafting the new French Constitution, and in doing so, helped fashion the Constitutional Council whose decisions in the new government were supreme and "not appeal[able] to any jurisdiction whatsoever" (p. 29). Rohr notes this as an example of an "administrative agency displaying a statesmanlike willingness to confer substantial power and authority upon a potential institutional rival," thus "giv[ing] pause to critics of administrative behavior who are all too ready to pontificate on the self-aggrandizing nature of administrative institutions" (pp. 29–30).

Furthermore, the Council of State continues to play an influential role in protecting the individual rights of French citizens in that the new Constitutional Council draws rights-based legal principles "from the jurisprudence of the Council of State." This represents "a concrete refutation of the facile assumption that vigorous administration is somehow at war with individual rights" (p. 254). American public administrators can take heart from this example because protecting individual rights is the first principle of the American Constitution. American governments will never have an administrative institution as powerful and revered as a Council of State, but citizens and bureaucrats alike should certainly ponder the Federalist argument that it takes a powerful government to effectively protect rights.

Second, Rohr paid special attention the abandonment of parliamentary sovereignty in the new French Constitution. Parliamentary sovereignty had been a source of instability since it was first established in the revolution of 1789. An institution considered sovereign is, by definition, above the law because it is the source of law. Such supreme power goes unbridled and is the cause of severe political and institutional disruption. Rohr viewed this change as "important for America" because (1) "Neither country has a sovereign *institution*", but rather "distributes less-than-sovereign power to specific governing institutions", (2) it reminds us "of the preeminent role of the Constitution in our own political life . . . in conferring legitimate [and limited] power on those whom we elect", and (3) "the idea of legitimate authority flowing from the Constitution is helpful for harried administrators whose participation in the governing process is often challenged by posturing elected officials and disgruntled citizens" (p. 256). Rohr adds emphasis to this last point with the conclusion he reached in his earlier work:

> Just as the Constitution explicitly created Congress and the Supreme Court, so too it explicitly empowers Congress to create other offices "by law," states how these offices are to be staffed, and for good measure, gives Congress all the means "necessary and proper" to carry out these powers. This is the Constitutional basis of the administrative state created gradually by Congress over the past two centuries. The fact that administrative officers are not elected has no effect whatsoever upon their constitutional legitimacy. (p. 256)

Finally, Rohr draws attention to the French antipathy to constitutional oaths which was born of a long history of abuse, especially during the hated Vichy Regime of World War II, and because it is deemed to "violate the individual rights of civil servants" (p. 267). Only the appointees to the new Constitutional Council must take an oath, but the reasons are unique to that body. It was required first because it was the role of the new council to prevent collapse back into parliamentary sovereignty which "would have undermined the regime of constitutional supremacy so clearly intended by

the founders of the Fifth Republic." Second, the oath is *professional* rather than *political* in nature. It requires the councilors to carry out their duties "with complete impartiality with respect to the constitution, to preserve the secrecy of deliberations and of votes, and not to take any public position nor to give any advice on any questions within the Council's jurisdiction" (p. 268). Rohr noted that although the oath requires councilor decisions to be based on the Constitution, "it does not require that he swear to uphold, defend, or even believe in it."

This is strikingly different than the oath American civil servants take. "There can be no doubt that [the American constitutional oath] touches the soul of the American civil servant. He or she must swear to 'uphold' and 'defend' the Constitution 'against all enemies' and bear 'true faith and allegiance' to it" (p. 269). This seems incongruous with American civil libertarian tradition, and yet, as Rohr observed, "we are so comfortable in demanding that civil servants publicly proclaim their belief in our Constitution. . .." (p. 269). The reason for this, Rohr believed, is that "it is our Constitution – and perhaps our Constitution alone – that holds us together as a people" (p. 269). France has many symbols, traditions, and institutional features which unify its people; the United States has few, if any, beyond what is rooted in some way in the Constitution. Thus, Rohr concludes, "So important is our Constitution to us that we depart from our customary abhorrence of compulsory political orthodoxy in order to be sure that anyone who exercises any sort of governmental authority shares our most cherished beliefs" (p. 270).

From this brief treatment, it is plain that Rohr's comparative research formed another part of his broader efforts to promote constitutional literacy among American public administrators. Indeed, it was an extension not only of his research but also of his efforts to enlist sympathetic colleagues in giving shape to a "constitutional school" of thought. These efforts were boosted by publication of numerous books and articles stemming from the constitutional bicentennial celebrations of the late 1980s, including Rohr's 2nd edition of *Ethics for Bureaucrats* (1989) and the publication of a *Public Administration Review* symposium on the Constitution in 1993.

## Promotion of a "Constitutional School" of Public Administration Scholarship

In the last stage of John Rohr's life and career, he worked steadily with close colleagues and students to promote a scholarly community that he called a "constitutional school" of public administration (see Newbold 2010; Morgan et al. 2010). This school would not advocate any particular constitutional perspective or orthodoxy. Rather, Rohr viewed the Constitution as establishing a republic in which many aspects of governing would remain contested and that this political reality is reflected in the institutions and dynamics of the public administration, as well as amid the superintending branches of our governments and their attempts keep that administration under their control. The constitutional school of public administration would work to remind public administrators and scholars that the field is inevitably and profoundly shaped by a variety of juridical perspectives born of constitutional controversies and legal principles. As a practice, the field is founded in that milieu, and we ignore this reality at our peril.

## Ethics in Government Finance

Robert W. Smith
Savannah State University, Savannah, GA, USA

Ethics is a thread that runs through all disciplines and professions. Acting ethical is a paradigm that is expected as a hallmark or mainstay of the professions. Equally ethics is compartmentalized. There are medical ethics, journalistic ethics, government ethics, and military ethics to name a few specializations. And there are many divergent yet interrelated definitions of ethics. This entry will not overanalyze nor simplify a treatment of "ethics" and will only offer some grounding points for a conceptual definition of ethics applied to government finance. Yet the importance of an ethical compass to guide the theory and practice of public finance is paramount given the analytic, financial, and political dimensions of the field. Indeed the trust placed in the efficient utilization of the purse to achieve public purposes is a hallmark to democratic governance in its most basic form.

Government finance as a field, inclusive of the budgeteers, accountants, government finance officers and administrators who produce and implement public budgets, has always been strongly identified with the norms of specialization, technical expertise, neutral competence, and professionalism. Ever since the advent of strong executive budget systems dating from the 1920s, budgeting and finance at the federal and state levels has been viewed as a scientific/rational process. Budgeteers and government finance officers add the numbers, balance the books, efficiently allocate public resources, and generally keep an eye on the public's purse.

Although the field of government finance remains wedded to these norms, the field certainly has evolved over the course of the twentieth and twenty-first centuries well beyond these narrow parameters. Indeed, public budgeting and finance staffs have become de facto and sometimes de jure policymakers. Budgeteers and finance officers are routinely involved in substantive policy negotiations, play a big part in the political wrangling over limited public funds, and are often involved in implementation that determines the delivery of public services. The evolving norms evoke images of policymaker, manager, and even politician. These labels are often downplayed by budget officials and practitioners but nonetheless constitute the job of the modern-day government finance officers.

In the twenty-first century, the field and profession have undergone dramatic changes as government finance officers have recognized an evolution of roles from the emerging accountant to the scientific neutral competent, to policy maker, then to de facto politician, and finally to "budget/finance processor." The government finance processor of the twenty-first century has the requisite financial and political skills to craft both efficient and responsive budgets and financial statements but is constrained by the limitations of surplus or deficit scenarios, divided government syndrome, cutback management, performance mania, and tax avoidance mandates. This is the launching point to consider the role of ethics in government finance.

Accordingly, this essay looks back in order to look forward. The lenses to gaze in both directions are the ethical norms associated with specific periods in the history of public finance and budgeting in the United States. However, these ethical norms are applicable for considering ethical pressures in budgeting and finance at the state and local levels of government as well. Moreover, because there is an international language of budgeting and finance, it can be argued that consideration of these ethical norms (despite their connection to specific US historical developments in the field) are indicative of a broader framework for considering ethical norms that exist in budget and finance systems across the globe but with certain variations.

The ethical norm for the government finance manager circa 1921 to 1960 can be described as a preoccupation with honesty in the presentation of financial information and integrity in the accountability of public resources. Although there are certainly exceptions, this brand of ethics can be characterized as deontological – where principle mattered. The ethics was in the process and mechanisms of budgeting and finance systems, albeit a cost-centered, accounting-focused function.

From 1961 through 1973, government finance officers embraced a rational approach to resource allocation. The use of sophisticated budgetary systems and forecasting models solidified the role of the budgeteers as master technicians. Finance officers equally turned to more sophisticated accounting systems and analysis. The ethical implications extended well beyond previous norms. For example, neutral competence took a back seat to strategic presentation of numbers supporting one position or another, application of flexible modeling assumptions which could vary the level of available revenues, or specification of what project costs and benefits were to be counted, and how much should they be weighted. Program budgeting systems, zero-based budgets, or performance budgeting became the means for quantifying difficult social issues into rational and predictable models. More sophisticated accounting rules also became the norm. Each model in turn could be utilized by government finance officers to develop budgetary priorities they, or their political superiors, supported. The budget and financial systems was always a political tool, but the new procedures and tools added sophistication to budgetary politics and financial interpretations. Budgeting and finance, more so than ever, became a normative exercise disguised in techno-rational logic. The ethical norm had shifted from one of accuracy to efficiency.

The evolution of budget/finance norms continued and the period circa 1974 to 1980 could be identified as the ascendancy of the government finance officer turned policy maker. The ethics for twentieth century budget and finance officials became more teleological – consequences mattered. Final outcomes tended to justify the means. If obfuscating numbers meant achieving

a budgetary goal or balancing accounts, so be it. This teleological-centered ethical norm was much more complicated than the ethics of neutral competence associated with straightforward portrayal of numbers. Indeed, the techno-rational norm paved the way for the decision-making norm where finance officers were active participants in the public policy process. Budgeteers and financial managers were focused on the linkage between money and policy. The amount of funding would dramatically affect policy areas such as environmental protection, affirmative action, and military deployments. Government finance officers were thrust into the limelight as de facto policy makers.

From 1981 to 1990, public finance officers faced a variety of economic problems that were at heart political problems and stemmed from huge deficits, the rhetoric of "no new taxes," and a preoccupation with performance and the right sizing of government. Hence, economic conditions, societal pressures, and politics set the parameters of public finance. Budgeteers/finance officers were often placed in the position of becoming politicians themselves. The budget more so than ever became a political tool for advancing agendas. Pervading the budget and finance process during preparation, negotiation, and execution were the political undertones that drove budget/finance decisions in each stage of the process. Success was measured by how well the budget and financial plan "fit" the political and economic circumstances.

The evolutionary cycle of government finance has come full circle and from 1991 to present. A "budget/finance processor" norm has emerged to define the work of budgeteers and government finance officers. The political backdrop particularly at the federal, but also at the state level, set the stage for this new normative identity for the field. Expediency has become the operative norm of government finance officers in the twenty-first century. A new set of questions characterized the budget and financial management process, and difficult ethical issues were just under the surface of this new financial mindset. A surplus might mean flexibility, but flexibility for what agencies or what constituents? Reengineering and reinventing could spell bad news for many government programs, but which programs or agencies? Cutback management and performance were necessary to achieve targeted personnel reductions and optimal service delivery, but they also could serve as a fundamental retooling of the public workplace. Finally, the no new taxes mantra placed artificial pressures on government finance officers to privatize, raise user fees, and eliminate services when this may or may not have been in the longer-term public interest.

The field has come full circle back to an almost mechanistic process of budgeting/financial management. Surplus or deficit, rising interest rates, status of the stock market, and Federal Reserve Board policy have become more important in determining the substance of the public budget than do the technical skills, policy analysis, or political skills of the government finance officer. This is not to argue that these norms/influences no longer impact budgeteers and financial managers, but the external environment of budgeting and financial management seems to be more of a determinant than does the development and execution of the budget itself. It should be clear that this trend has profound implications for the ethics of public budgeting and finance. If the profession is under an automatic pilot process for preparing budgets and financial systems and is focused more on an expediency formula to develop and execute budgets, there is great uncertainty as to the primacy of ethics in twenty-first century government finance.

## A Brief History of the Ethical Norms of Government Finance

The field of public budgeting and finance has been characterized over the years as a field, which is plagued by the lack of a unifying theory of budgeting. It is simply not necessary to reconsider all the works on the lack of a budget theory since Key's (1940) work in 1940 or to reconstruct yet another timeline of developments or reforms in public budgeting. See Rabin's (1997) comprehensive chronology for an overview of the important developments in public budgeting and finance

since the thirteenth century. However, it is necessary to ground the argument for an ethical theory of government finance in the context of significant developments in the field. Five distinct ethical norms will be presented and linked to some specific budgetary/financial reforms or developments for the purpose of theory generation.

### Accounting/Fiscal Norm

The start of the first period of the government finance officer in an accountant/fiscal caretaker role emerges with the passage of the Budget and Accounting Act of 1921. It has been argued that the accounting orientation of budgeting at the federal level dates back to the earliest days of the republic. The significance of line-item presentation and cost accounting functions of governmental budgeting has a long history. Balancing the spreadsheet mattered. The budget scholarship and developments of the period attest to the accounting orientation of the early twentieth century (e.g., White (1926), Willoughby (1927), Gulick's (Gulick and Urwick 1937) *Papers on the Science of Administration*, the ascension of operations research, utilization of impoundment mechanisms by President Roosevelt, creation of a legislative budget, Herbert Simon's (1945) work, and the first Hoover Commission Report (United States Commission on Organization of the Executive Branch of the Government 1949).

Many of these developments are much more than accounting conventions but are presented as part of the accounting/fiscal norm because fiscal accountability was paramount in view of limited resources in the face of pressing needs of a growing and seemingly globally oriented nation. Government finance was the de jure and de facto mechanism by which resources were provided for these ends. Changes to the congressional appropriations process give evidence of the accounting orientation. Jesse Burkhead's (1956) classic text emerges in 1956, a second Hoover Commission (United States Congress 1955) in 1955, and the institutionalization of Public Law 863 (U.S. Public Law 1956) also in 1956 (requiring the accrual method of accounting and cost-based budgets) all support this accounting/fiscal norm. This norm represents one end of an ethics continuum grounded in deontological ethics where duty, principle, integrity, and fiscal responsibility were the key.

### Techno-Rational Norm

From 1961 to 1973 and the institution of Program Planning and Budgeting Systems (PPBS), first at Rand and then in the Defense Department under Robert McNamara, there was a realization of the significance in linkage between budget resources and operations. The weight of scientific thinking and growing academic literature in public administration were taking hold. In the 1960s scholarly work from Cyret and March (1963) and Chris Argyris (1964) supported this perspective. Concurrently many state governments embraced PPBS. Later Fenno's *Power of the Purse* (Fenno 1966) and Management by Objectives literature also emerged during this period. The creation of OMB in 1970 epitomizes the pinnacle of the rational and scientific orientation role of budgeting and financial systems thinking in government. The development of Zero-Based Budgeting by Pyhrr (1973) in 1973 coincided with the debacle over impoundments between President Nixon and Congress. This led to the Congressional Budget and Impoundment Act of 1974 (Public Law 1974) which signaled yet another normative shift for the field. The techno-rational norm moved the field down the ethics continuum away from its deontological founding and established the primacy of scientific method and efficiency as the ethical norm for government finance. The process still mattered, but achievement of goals became a more significant driving force.

### The Policy-Maker Norm

From 1974 to 1980, it became clear that perhaps the science and rationality of government finance could not solve the economic (a major recession) and political realities confronting modern-day government. But this period tended to place the budgeteer and financial manager on the center stage of policy debates. It was Aaron Wildavsky (1974) in 1974 who observed the very political and incremental nature of change and public budgeting and finance. Scholarship by Lynch

(1979) and Schick (1980) later in that decade struggled to define the field. In 1974, the Congressional Budgeting and Impoundment Control Act (Patashnik 2000) created the Congressional Budget Office (CBO) and the House and Senate Budget committees and changed the impoundment powers of the President. These changes gave to Congress important powers that provided a more comprehensive view of the overall budget and financial system. In some respects this required Congress to engage in policy making through the budget. The shift in budgetary power went from the President and OMB to Congress with a heightened awareness of the tax and spending decisions linked to specific policy outcomes. This period demonstrates the beginning of a new orientation about budgeting and finance that some scholars have categorized as the "fiscalization" of the policy debate. Patashnik (H.R. 3982 1981) pointed out that, by this phrase, they meant the new tendency for politicians and policy makers to debate programs not according to their particular merits but according to their impact on the government's overall fiscal condition. It was impossible to separate the policy from the budget and fiscal considerations. More important, it marked yet another shift toward the teleological end of the ethics continuum. For government finance officers, it didn't so much matter how they got there, as long as the process met the public policy agenda.

### Political Norm

The election of Ronald Reagan in 1980 and the subsequent passage of the 1981 Omnibus Reconciliation Act and Recovery Tax Act (Stockman 1986) put a distinctive normative imprint on public budgeting. This was evidenced much later in 1986 through the revelations of David Stockman (Public Law 1985), former Director of the Office of Management and Budget, about budgeting during the Reagan years and the de facto use of budgeting as a tool of politics. At minimum the political overtones were present in the decisions being made in Washington. These political machinations were paralleled at the state and local levels and were wrapped in such rhetoric as block grants versus categorical grants, devolving federal power/intrusion in local matters, and debates over waste and inefficiency in Washington and in state capitals. The budget became more adversarial, ideological, and partisan, where policy differences were now played out as a battle of budget priorities. Yet, these developments pointed to a teleological norm profoundly shaping the dynamics of public budgeting and finance and the look of government for the balance of the 1990s.

From the 1986 Tax Reform Act until 1991, the budget and government finance officers seem to have been held captive to the vagaries of the economy, a stock market crash in 1987 and the massive deficits that were occurring over the period as a result of massive tax cuts and defense spending policies both widely embraced by most Americans. The size of the deficit had a stifling effect on the economy, and the budget played literally no role in the unfolding of economic events. Deficit politics were behind the imposition of artificial ceilings and levels of funding which were driven by entitlement mechanisms or inflation. To address the mounting deficit problem, Gramm-Rudman-Hollings Deficit Reduction Act (Budget and Emergency 1987) in 1985 and Gramm-Rudman-Hollings II (Bartle 2000) in 1987 imposed automatic spending reductions across the board as efforts to impose restraints on a budget process that did not work according to Bartle (Omnibus Budget 1981). Following suit was the Omnibus Budget Reconciliation Bill of 1987 (The Budget and Accounting 1921) and the pay-as-you-go approach to budgeting and government finances. The shift toward the teleological end of the spectrum was just about complete where budgets and targeted levels of spending were determined by political and economic agendas.

### Budget Processor Norm

With the automatic imposition and extension of targets, the folly of this approach was soon evident, and a series of Omnibus Reconciliation Bills continued to keep the government running. The seemingly innocuous, but important, Budget Enforcement Act of 1991 affirmed the process of setting targets which were eventually achieved with the first balanced budget during the Clinton

Administration in 1998 (something not foreseen even with the 1997 Balanced Budget Act which set a 2002 date for a balanced budget). This legislation established categories of discretionary spending with limits for defense, international, and domestic programs. Expenditures exceeding the limits could be sequestered. Entitlement and revenue changes were placed on a pay-as-you-go system.

But the BEA of 1991 was an important turning point in establishing a normative shift toward budget and finance processes. What happened is epitomized by the now famous and unattributable quote "It's the economy stupid." Despite the absence of budget discipline or leadership, it was the reversal of the economy and highest employment rates in a history that led the way for a dramatic economic recovery. Moreover, the period since 1991 can be described as a period of the monetarists. The power of the Federal Reserve Board emerged as the driving force in moving the economy. The budget was seen not as instrumental to the economy and direction of government, but merely a framework for setting national priorities.

In the 2000s and extending into 2015 and beyond, this budget processor norm has dominated although overshadowed by macro-level impacts on the economy and public finance at the national level characterized by international engagements in Iran and Afghanistan and of course the Great Recession in 2008. The active intervention of the Federal Reserve and Treasury in the economy (including bailouts) and a return to a Divided Government paradigm coupled with a preoccupation with the Federal Deficit and Debt have solidified this budget/finance processor norm. This norm and the fiscal and economic realities center attention even more on the ethical drivers of government finance.

The point is that the mantra driving government finance officers was not so much the influences of accounting, scientific methods, or politics but their dependence on factors outside their control. Government finance officers operating in this environment become not so much accountants, evaluators, or policy makers but instead are relegated to the role of processors. A processor simply goes through the motions of the budget/fiscal exercise because decisions about government finances are really decisions already made in other areas. This ushers in the age of the budget/finance processor as more the caretaker of the public purse or servant in the allocation of resources dutifully meeting the accounting, technical, policy making and political goals of government. In this capacity the ethical norm is one of expediency, and the shift to the teleological end of the continuum is complete. Only the outcomes matter, not so much the process of deliberation, analysis, and debate over budgetary and financial priorities.

Hence, it is the consideration of these five distinct stages, presented as ethical norms, which do more to explain the overall orientation of the field. The ethics norms not only carry some explanatory power for the events and developments in public budgeting and government financial management but also hold keys to the development of a comprehensive theory of government finance from a normative point of view. This theory recognizes that the field of government finance is and always will be a political, behavioral, and normative process despite all the trappings of reforms, technical procedures, legislative remedies, or executive prerogatives imposed upon the financial process. However, it is an ethics paradigm that offers a unifying theory to connect history and developments in the field of government finance.

## Ethical Implications

This entry attempts to present a new way of thinking about government finance and developments as a component of evolving ethical norms. These norms must be grounded in the lexicon of government finance and grounded in previous developments in the field. However, using ethics or values to frame developments in public administration is not new (Quinn and Rohrbaugh's 1983). Competing values perspective of public sector organizations is profound for mapping organizations along dimensions which includes models on human relations, open systems, internal processes, and rational goals. The point is that each of these models offers conflicting value orientations

(i.e., ethical norms) under which managers in an organization must operate. To be successful, they must balance each. This approach is relevant because the norms of government finance, while not mutually exclusive, do capture important defining characteristics that help explain not only organizational development but characterize the orientation of government finance officers toward their field.

## Ethical Foundations Applicable to Government Finance

Carol Lewis (1997) offers an adequate discussion of the ethical parameters involved in the decision making of public budgets. If the budget making process is truly a resource allocation decision then it is clear that the budget process involves a political decision-making process. The import of ethics in this dynamic is how ethical decisions are arrived at in determining those budgetary allocations. Lewis presents this ethical decision-making process on a number of levels.

The overarching ethical parameters in the public service are avoidance of a conflict of interest and serving public interest. But under these two public service mantras are the substance of ethical decision making in public life and budgetary/finance scenarios. Not using public office or resources for personal gain, not accepting bribes, and not misrepresenting information seem consistent with the first mandate. The second mandate involves confronting the dilemma of values, duties, and principles associated with public service. These considerations are addressed in various treatments in the literature, but perhaps best illustrated by Miller et al. (2005) who conducted a survey of financial managers to evaluate ethical pressures during periods of fiscal stress and political pressures to be responsive to various stakeholder demands. Here the ethical grounding is in either a deontological point of reference (duty or principle and doing the right thing comes first) or teleological (where the only final outcomes matter in order to achieve a higher end/goal). When government finance officers are faced with meeting the public interest, sometimes painful decisions need to be made about terminating programs or downsizing staff. Those actions may be in the public interest of taxpayers but not in the public interest of those served by the programs or those public employees losing their jobs.

Herein lies the real dilemma of government finance: does the deontology of professional norms and servitude to elected officials weigh against the reality of teleological approaches? Decisions in public finance must be made all the time either with secrecy of budget/financial information, obfuscation of numbers, non-acknowledgement of budgetary decisions, strategic misrepresentations in budgeting, maximizing positions in budget negotiations, low-balling costs, accounting conventions, manipulation of inflation rates or benefit-cost calculations, misrepresentation of forecast data, the threatening of cuts or raising taxes as part of positioning for achieving policy or political agendas, and scenarios of state versus local versus federal posturing. All of these occur in the world of the government finance officer, and not to recognize these pressures and realities means not understanding the true nature of government finance. See Jones and Euske (1991) for a more substantive treatment of these strategic misrepresentations in budgeting. Also Simon et al.'s (1997) critique on management information has direct import, as do many discussions of flexibility in revenue forecasting estimates used by government. For the private sector, McCurdy et al. (1993) has assembled some empirical evidence to indeed suggest that budgeteers face internal and external ethical pressures on the job.

Do all government finance officers knowingly behave unethically? Of course not! However, many budgeteers/finance managers act without focusing on the ethical import of their actions. Such practices are simply part of the job, not something to be questioned from the perspective of an ethical norm. So where can the budgeter/finance officer turn for guidance in trying to understand how far to push the ethical norms on the job. One place to turn is the National Association of State Budget Officers (NASBO) Code of Conduct (National Association of State Budget Officers 2000). The other is the Code of Conduct promulgated by the Government Finance Officers Association (GFOA) (2000). These codes stress

responsiveness to political officials, adherence to standards of professional practice, honesty and integrity, commitment, fairness, and respect for others. Avoidance of conflict of interest, avoidance of misstatements, public accountability, independent objective judgment and personal accountability for decisions are paramount. Codes are only as important as they are enforced or stressed in the field. No doubt all NASBO officials have a statement of both principles in their offices, yet there are few sanctions imposed by NASBO or the GFOA. Officials will argue that enforcement of the code is not so much the purpose as is the establishment of an ethical environment reinforced by those principles. Other tools are available to government finance officers for weighting the import of ethics in their decisions. Stakeholder analysis and cost-benefit analysis can weigh the ethical parameters of a budgetary/fiscal decision.

With this ethical foundation, from an operational perspective, how can ethical norms help explain government finance? The answer lies in the work of other scholars who have attempted to examine the ethical implications of public budgeting and finance. How have budgeteers/finance officers attempted to deal with these ethical dilemmas over the past century? This entry argues there has been a predominant ethical norm that has defined the field for certain periods of time over the course of the twentieth century. These ethical norms are relevant for an understanding of where government has been in terms of developments, theoretical grounding, and reforms. Hence, these ethical norms may hold promise for a unifying theory of public budgeting and finance.

## The Treatment of Ethics in the Government Finance Literature

The overall picture may not be so bleak, but it certainly is not well researched. Some scholarly efforts have been made to examine the issue (e.g., Alexander 1999). Alexander identifies two ethos operating in the arena of public budgeting and posits that neither the technocratic ethos nor the bargaining ethos do much to explain developments in budgeting. She argues for the imposition of a third ethos, that of a democratic ethos, to guide the actions of budgeteers in the twenty-first century. Her argument, while similar to John Rohr's (1989) appeals for a democratic foundation in public administration, nonetheless comes face to face with the quandary that "[there is]. . .a growing schism between the abstraction of budgeting theories and the experience of budgeting as a practice." (Alexander 1999). This entry addresses this predicament.

The recognition of the moral or value base to government finance is not new (witness V. O Key's or Wildavsky's normative forays into theory) but has received more attention as of late. Reck (2000) has examined moral judgment on budget allocation decisions by budget officers. The work of Douglas et al. (Douglas and Weir 2000) also confirms the creation of budgetary slack and information asymmetry. Ethical positions were found to be related to creation of budgetary slack. Moreover, the professions themselves have recognized the growing ethical concerns in the field (e.g., NASBO and GFOA codes). In fact NASBO has a self-diagnostic ethics instrument (see http://academic.evergreen.edu/curricular/atpsmpa/NASBO%20training_modules.pdf (National Association 1999)). Yet despite codes and some formal training, the field is still struggling with issues of ethics and misrepresentation (see Jones and Euske (1991) and Baldassare (1998)).

The concern with ethics in financial management is not confined to the public sector. One survey of managerial accountants identified relatively low pressures to act unethically yet identified that ethical pressure was likely to come from within the organization rather than an external source (McCurdy et al. 1993). Moreover, there are primarily anecdotal reports that acknowledge the necessity of ethics. More damning is Larry Ponemon's (1992) work that identifies aspects of the ethical culture of accountants, which tends to stymie higher-level ethical reasoning. There is reason to suspect these same culture pressures also exist for public sector budgeteers.

Recently the State of Ohio instituted a "Fiscal Watch" program for local government financial managers and requires them to take annual classes

in finance and ethics (Swope 1999). The topic continues to garner attention (e.g., an electronic symposium on Ethics and Public Budgeting and Financial Management 2000) (Entire Issue dedicated 2000). However, the purpose of this entry is not how to make government finance officers more ethical, instead it proposes a normative theory that may help budgeteers/finance officers understand their field.

In contemporary treatments offered by Rossmann and Shanahan (2012), their research and related survey found that budgeteers view their roles as both structural and procedural, highlight the need for ethical behavior and leadership, and recognize the tension between democratic values and the techno-rational imperative. The answer to their concerns about a democratic ethos in budgeting may be found in the latest efforts behind Participatory Budgeting (see www.participatorybudgeting.org/) (Participatory Budgeting 2014). Participatory Budgeting is a trend that is unfolding as a practical tool that embraces several elements of ethical norms with technical aspects of budgeting – long a hallmark of the field. Robbins et al. (2008) illustrate the interface between citizens and resource allocation behind the push toward Participatory Budgeting. Sintomer et al. (2008) explore the impact globally, and Ebdon (2002) looks at the scope of participation in budget decisions at the local level. These themes highlight the growing ethical imperative of ethics in government finance.

## Conclusion and Observations

It is up to budget and finance scholars and, more importantly, practitioners to set the proper balance of ethical norms in government finance. Having a simple ethics code is good for operations, but it is not the answer for the field as a whole. In the final analysis, the observation advanced in this entry is that the solution to the lack of a theory of government finance can be found by looking in an area many believe is only peripherally connected to public budgeting and finance. The answer does not lie in economics, organization theory, policy science, decision-making systems, incrementalism, politics, or contractual/principal-agent theories. Instead, the answer lies in a paradigm that combines all the aspects of these constructs – namely, the ethical norms behind these areas. Thinking of public budget and finance developments and practice through the lenses of ethical norms provides a telling picture that accurately depicts where the field has been and where the field may be going in the twenty-first century and beyond.

# Ethics in Public Administration and Government

Liza Ireni-Saban
Lauder School of Government, Diplomacy and Strategy Interdisciplinary Center (IDC), Herzliya, Israel

## Ethics Management in the Public Service

Ethics management is generally defined as the process of applying ethics to organizational contexts, aiming at promoting ethical conduct and impeding unethical behavior (Frederickson and Ghere 2005; Kaptein and Schwartz 2008; Menzel 2010; OECD-PUMA 1998; Van Wart and Dicke 2008). The field of ethics management embraces various tools available to manage ethics in organizations to promote professional conduct and impede unethical behavior including ethics codes, ethics committees, ethics audits, ethics training, and other disciplinary measures for sanctioning unethical behavior and rewarding ethical behavior (Ireni-Saban 2015).

### The Rationale for Ethical Codes

Ethics management in the public service is often governed by codes of ethics or codes of conduct. Codes of ethics are introduced as a set of values and professional standards to encourage practitioners to develop a sense of commitment to

ethical behavior and professionalism among members of the professional community (Van Wart 2003). Codes of conduct, usually set out for specific action(s) in which individuals should not engage, specify sanctions and specific penalties in cases of ethical infringements.

To proscribe ethical decision making, ethics codes in the public service must articulate core values that govern the public service consistent with society's norms for retaining public trust in its moral and professional standards. Despite the enactment of ethics codes in public administrations and governments across national settings, there is little evidence of their effectiveness in controlling corruption or impeding unethical behavior in the public service. Since 1989, several studies have been carried out by Bowman and his colleagues on ethics management in public agencies with an emphasis on the behavioral effects of codes in public service organizations (Bowman 1990; Bowman and Knox 2008; Bowman and Williams 1997). These studies showed gradual awareness among public servants of ethics codes with minor potential for it to impact daily management of public affairs. An additional study on measuring the effectiveness of codes of ethics was conducted across 154 national administrations relating to the effect of the code on the level of state corruption. The researchers concluded that the existence of a code of ethics in the public service has no effect on reducing levels of official corruption in both developed and developing countries (Garcia-Sanchez et al. 2011).

Codes of ethics in the public service are assumed to meet various goals including:

- To guide expected ethical behavior and reduce levels of corruption
- To support the process of professional socialization of new, unexperienced employees or those who are not familiar with the public service core values and standards
- To increase public trust and identify citizens' and stakeholders' expectations
- To support the government and improve the quality of the public service
- To guide public servants when faced with conflicting values, commitments, and interests
- To develop a sense of pride and belonging to the public service in motivating employees to consider themselves as professionals

Codes of ethics and codes of conduct are widely used across national settings and international bodies to guide ethical conduct and good governance practices in the public service. The following overview introduces the growing awareness of ethics management in the public service across the globe.

## Comparative Overview of Existing Ethics Management Tools Across National Governments and Public Administrations

### Ethics Codes in the United States and Canada

Ethics codification efforts to enhance ethical governance are undertaken by America, Canada, Europe, Asia, and Africa, mainly sub-Saharan countries, as well as by international organizations. For example, the American Society for Public Administration (ASPA) initiated the Professional Standards and Ethics Committee in 1974, which was formally approved in 1984 and revised in 1994 and later on in 2013 (American Society for Public Administration 2010). ASPA's Code of Ethics articulates the association's commitment to promoting ethical competence among its members. The Code's main tenets include: Serve the Public Interest; respect, support, and study government constitutions and laws that define responsibilities of public agencies, employees, and all citizens; demonstrate the highest standards in all activities to inspire public confidence and trust in public service; strengthen organizational capabilities to apply ethics, efficiency, and effectiveness in serving the public; and strengthen individual capabilities and encourage professional excellence. The 2013 revision extends the responsibilities of public servants to emphasize the importance of ethical leadership as an essential strategy aimed at improving the ethical performance and competence of public servants (Svara 2014).

In Canada, the Values and Ethics Code for the Public Sector came into force on April 2, 2012. The Code embedded the need to enhance the reputation of public service by complying with principles of equal treatment, effectiveness, integrity, and accountability when performing their duties (The Values and Ethics Code for the Public Sector 2012).

### Ethics Codes in Europe

As part of the United Kingdom's civil service efforts to build ethical governance in the public service, the Civil Service Code was adopted to support civil service management reforms. The Code, published in 1996, set out core civil service values and the standards of behavior expected of all civil servants, including: "Integrity – putting the obligations of public service above personal interests; Honesty – being truthful and open; Objectivity – basing advice and decisions on rigorous analysis of the evidence; and Impartiality – acting solely according to the merits of the case and serving governments of different political parties equally well" (Civil Service Code 1996).

The need to raise public trust in public administration is entrenched in the Finnish Code: "In our own work, we safeguard the trustworthiness of public service, so that citizens' trust in the impartiality and independence of public service activities is preserved. We discharge our duties in compliance with legislation and principles of good administrative practice. Our operation must also be seen to fulfill the requirements of good administrative practice in the eyes of an external evaluator" (Finland Ministry of Finance 2005).

Estonia was the first of the Baltic countries and in the region to introduce a Public Service Code of Ethics, which was incorporated in the Public Service Act in 1999. The first article of the Estonian Code articulates the idea that public administrators have an obligation to support the transition to democratic public management. The Code states the responsibilities of public servants to both political supervisors and to citizens and who are required to balance the two: "An official is a citizen in the service of people." The democratic values entrenched in the Code include "Serving the public, respect for the law and people, loyalty to government, public participation, political neutrality, impartiality, objectivity, predictability, openness, honesty, reliability, responsibility, consciousness, competence" (Public Service Code of Ethics (Estonia 1999)).

In Poland, the purpose of the Civil Service Code of Ethics is defined as follows: "To increase the citizen's confidence in the State and its authorities" (Civil Service Code of Ethics (Poland) 2003). This is also entrenched in the Code of the Czech Republic, which aims "to gain and maintain the public trust, to promote the desired standards of behaviour among public servants and to inform the public about the standards that citizens have a right to demand from public administration employees" (Code of Ethics of Public Servants (Czech Republic) 2004). The Code of Ethics was introduced by the Czech Republic authorities as part of their efforts to increase citizens' trust and confidence in government and the public administration.

By communicating the content of the codes to public servants on a regular basis, ethical behavior can become a habit ingrained in public administration. This purpose is entrenched in the Code of Ethics for Civil Servants of Macedonia: The Macedonian document seeks to "regulate the manner of conduct and the operations of the civil servants in order to ensure recognition of the principles of legality, professional integrity, efficiency and loyalty in performing their official duties" (Agency for Administration of the Republic of Macedonia 2002). The Code of Ethics was part of various reforms introduced in the public administration of Macedonia during the first decade of the twenty-first century. These reforms aimed at educating the civil servants with low performance and unethical behavior in their daily contact with the citizens (Selami 2012).

### Ethics Codes in Asia

In its early days, public service in China, especially the military, was based on merit (Jing 2010). Officials were selected with regard to their knowledge and commitment to the values of Confucian legacy. Since 1978, the public service in China has gradually combined elements of modernization, such as specialization, meritocracy, due

process law, and accountability, to fight against corruption and unethical behavior. In 1993, China adopted a managerial approach to public management that stressed the value of accountability in policy making. The provisional Regulations for State Civil Servants were circulated to replace the cadre system. The introduction of the cadre management system focused on administrative downsizing and recruitment, based on open competition, usually through an examination process and limited for the most part to university graduates and qualified staff from the public sector. By 2002, the Chinese government codified civil service processes and structures and launched the Norms of Behavior and Professional Ethics of State Civil Servants (Guojia gongwuyuan xingwei guifan). These reforms finally led to the adoption of the State Civil Service Law in 2005, which placed more value on professionalism in the public service. Chapter IX (Article 53 (http://www.asianlii.org/cn/legis/cen/laws/tcslotproc462/)) of China's Civil Servant Law clearly specifies incidents of unethical and corruption including:

> (1) disseminating any expression that damages the state reputation, organizing or participating in activities such as assembling, procession and demonstration that aims to oppose the state; (2) organizing or participating in any illegal organization, or organizing or participating in any strike; (3) neglecting his duties so that the work thereof is bungled; (4) refusing to carry out the decision or order as made by the superior thereof; (5) suppressing criticism or taking revenge; (6) practicing fraud in order to mislead or cheat the leader thereof or the general public; (7) being corrupt, giving or accepting bribes, making use of the post to seek personal gains for himself or others; (8) violating the financial and economic disciplines and wasting state assets; (9) abusing his power to infringe on the legitimate rights and interests of any citizen, legal person or any other organization; (10) discovering any state secret or work secret; (11) damaging the state reputation or interests in foreign affairs; (12) participating in or supporting activities such as eroticism, drug abuse, gambling and superstition, etc.; (13) acting against professional ethics or public morality; (14) undertaking or participating in any profit-making activity, or holding a concurrent post in an enterprise or any other profit-making organization; (15) being absent from work or in the event of a business trip or a leave, failing to return at expiration of the leave of trip without any justifiable reason; or (16) any other act in violation of disciplines.

As part of a growing tendency to build a distinct vocation of public management compatible with values of professionalism and political accountability, the Chinese government codified civil service processes and structures and launched the Norms of Behavior and Professional Ethics of State Civil Servants (Guojia gongwuyuan xingwei guifan) in 2002. The managerial reform brought a new focus to ethical consideration of the performance of Chinese civil servants that gave more weight to values of accountability than execution of orders (Ireni-Saban 2015; Tsao and Worthley 2009). In 2011, the Chinese government developed an ethics training program for the country's civil servants designed to promote the desired professional standards of behavior among public servants and to ensure their awareness to meet the principles of professional integrity, accountability, and responsibility in their daily official practices (Huazhong 2011).

The public service in Japan has a long tradition of administrative structure involving the classes of the samurai and the warlords; it was during the Meiji Restoration era (1868–1912) when the Japanese public administration was established in its modern form. Following the Meiji era until the end of World War II, the lower ranks of the samurai class were recruited from graduates of Japan's recognized universities (Muramatsu 1997). The Japanese Society for Public Administration (JSPA) was established in 1950, stipulating public administration as a discipline. The JSPA involved academic public service research conducted domestically and through cooperation with Asian and other specialists and institutions. By 1999, the Japanese Diet (the National Assembly) enacted the National Public Service Ethics Law. The Law aims to show its commitment to ethics and good governance to maintain the trust of Japanese citizens. The law set forth three general ethical principles including:

> (1) Employees shall not give unfair, discriminative treatment to the public . . .and shall always engage in their duties with fairness, recognizing that they are servants of the whole nation and not of any group thereof. (2) Employees shall always distinguish between public and private affairs and shall not use their duties or positions for private gain for themselves or the organization they belong to and (3) Employees shall not take any actions that create

public suspicion or distrust against the fairness of public service while performing their duties, such as receiving a gift from entities influenced by their duties. (http://www.cas.go.jp/jp/seisaku/hourei/data/npsea.pdf).

The Code of Ethics added two more guidelines to those entrenched in the National Public Service Ethics Law: "(4) Employees shall, in performance of their duties, aim at increasing public interests and exert their utmost efforts and (5) Employees shall always behave recognizing that their actions may influence the trust in the public service, even outside of their official hours." In addition, the National Personnel Authority develops ethics training programs to ensure effective communication of the Code. The importance of raising public trust through the initiation of the codes of ethics for the public service is also assigned in the South Korean context. South Korea introduced a code of conduct in 1981 for retaining the integrity of public officials (Public Service Ethics Act (Korea) amended 1993). The code specifies the standards of expected ethical conduct by both state and local public officials, namely, promotion of the public interest, conflicts of interest, the use of one's official position for private gains, and avoiding accepting money or other gifts beyond certain limits.

It is suggested that both Japan and South Korea acknowledge the need to enhance public trust in the government and increase effective communication with citizens (Kim 2010). Indeed, ethical conduct by public administration was regarded as an important statement by the government to challenge the dominance of Confucian legacy and values and strengthen the legitimacy of public service in the eyes of the citizens (Mishler and Rose 2001). Institutional context, political culture, and citizen–state relationships may also be important factors in raising the level of public trust in government (Christensen and Lægreid 2005).

Hong Kong is considered a Special Administrative Region (SAR) in China. Ethics management in Hong Kong public service is reflected by a mixture of Weberian structure and Confucian values and ideas (Lui and Scott 2001). In practice, Hong Kong civil servants are expected to carry out their official duties with political neutrality, impartiality, and loyalty to superiors. Viewed in this way, Hong Kong public service leaves no room for individual moral discretion. Hong Kong ethically manages the conduct of public servants through bodies such as the ombudsman and an anti-corruption body, the Independent Commission Against Corruption. In addition, the Hong Kong government issued a civil service code of conduct (http://www.csb.gov.hk/english/admin/conduct/files/CSCode_e.pdf). Despite the fact that the professional standards entrenched in the code are still treated with a high level of abstraction, ethics management in Hong Kong public service increasingly adopts mechanisms of promotion and rewards to foster ethical governance (Zhu 2000).

The civil service in Indonesia was founded on the Javanese administrative regulations. The Javanese administration was highly centralized and authoritarian based on a hierarchical structure of administrative chain of command by the master (*gustiand*, local ruler) and his servants (*kawula*) (Anderson 1972). The Javanese values laid the basis for a centralized and patrimonial structure. Due to the fact that Indonesia is struggling with rampant corruption in the public service, the Indonesian government took measures to combat corruption and develop ethical infrastructure for the public service. In September 2004, the government introduced the code of ethics (Government Regulation no. 42 of 2004). The code is assumed to be socialized to members of government agency and professional organization to which they belong.

In Singapore, all civil servants are required to monitor the code of conduct, which is embedded in the Instruction Manual. The code of conduct covers several key guidelines, namely, self-regulation, channels for reporting wrongdoings, and disciplinary framework in cases of conflict of interest, gifts, and entertainment. Infringement of the code of conduct may lead to disciplinary penalty controlled by the Public Service Commission that functions as an independent body (http://www.psc.gov.sg/).

In 1989, the Philippine government enacted a Code of Conduct and Ethical Standards for Public Officials and Employees (accompanied by Rules

Implementing the Code of Conduct and Ethical Standards for Public Officials and Employees) (Republic Act No. 6713) (http://www.lawphil.net/statutes/repacts/ra1989/ra_6713_1989.html). The code and the ethical standards were initiated with the purpose of strengthening public trust and confidence due to growing levels of citizens' distrust in the public service. Given the country's commitment to the "people's power," the principles entrenched in the code are concerned with upholding the public interest with emphasis on professional excellence and norms of equity. Disciplinary measures to ensure compliance with the code include penalties for disciplinary infringements along with rewards for exemplary service. In addition, the Philippine government uses additional measures to strengthen ethical conduct in the public service through congressional committees, namely, the House Committee on Ethics and Privileges and the Senate Committee on Ethics and Privileges.

The development and implementation of ethics codes in the public service is also apparent in African countries in transition from authoritarian to democratic regimes. The function of the Code of Conduct in Nigeria is to serve as a management tool in adopting the New Public Management approach in sectors of the economy. The core values entrenched in the Code combine professionalism and compliance to ethics standards:

> (1) Discrimination: A public officer is not expected to discriminate against any citizen on the grounds of place of origin, sex, religion, status, ethnic or linguistic association. This is clearly stated in Nigeria constitution, which commits the state to the ideals national integration. As instruments of state policy, public officers are expected to set the highest examples in pursuing these noble objectives. (2) Discipline: This is the hallmark of a responsible public officer. Strict adherence to the rules and regulations of the public service is a must for a civil/public servant. As a senior officer, it is imperative that an officer complies with the code of Conduct and ensures that subordinates do the same. (3) Loyalty: Loyalty should be an integral part of the behaviour of a public officer. This implies faithfulness to the nation and the employer and supportive of the aims for which one is employee. (4) Honesty and Transparency: These should be cardinal principles for any individual holding public office, and should be demonstrated in conducting official duties and in dealing with members of the public. This means that the public officer should be conscientious on duty. All his actions must be clear and self-evident. Public officers should not demand or receive anything in return for performing official duties. (5) Accountability: A public officer should display responsible stewardship for all items, money, materials and men placed under his supervision. This implies that all government property entrusted with a Public officer should be properly accounted for viz strict adherence to the civil service rules, financial regulations and all other circulars pertaining to the disbursement, management and reporting on same. (6) Respect for Constituted Authority: A public officer should show unqualified respect for constituted authority and the country at large. (7) Punctuality and Absenteeism. A Public officer should endeavour to be punctual at his place of work. Public officers should also not absent themselves from work except on approval. (8) Good Conduct and Ethical Behavior: To ensure that public officers cultivate appropriate conduct and ethics in conduct of government business, the Bureau recommends the establishment of in Situ primary Code of Conduct committees in all the Ministries Extra Ministerial departments and Agencies of Government. All matters relating to breach of conduct and ethical behaviours within each specified establishment must be .addressed within approved guidelines. Matters not satisfactorily resolved within the establishment are to be reported to the Code of Conduct Bureau for appropriate action. (http://www.hipernetix.com/ccb/ccb_ethics.html).

## Ethics Codes in International Organizations

Efforts to develop ethics management across the globe are also undertaken by international organizations such as the OECD and the International City/County Management Association (ICMA). In April 1998, the Public Management Committee of the Organization for Economic Co-operation and Development (OECD) prepared a set of Principles for Managing Ethics in the Public Service to assist countries in monitoring their institutions, systems, and mechanisms for elevating ethics management (see Principles for Managing Ethics in the Public Service, OECD-PUMA 1998). Based on the experience of OECD countries in developing and managing codes of ethics for the public service, the Committee has set the following guidelines: "Public servants need to know the basic principles and standards they are expected to apply to their work and where the boundaries of

acceptable behaviour lie. A concise, well-publicised statement of core ethical standards and principles that guide public service, for example in the form of a code of conduct, can accomplish this by creating a shared understanding across government and within the broader community" (OECD-PUMA 1998).

To encourage ethical leadership, the OECD committee suggests that political leaders hold the responsibility for maintaining a high standard of ethical behavior by establishing legislative and institutional arrangements that "reinforce ethical behaviour and create sanctions against wrongdoing, by providing adequate support and resources for ethics-related activities throughout government and by avoiding the exploitation of ethics rules and laws for political purposes" (OECD-PUMA 1998).

The International City/County Management Association (ICMA) aims to encourage professional local government across national setting: "The organization's mission is to create excellence in local governance by developing and fostering professional management to build better communities" (ICMA 2004). The ICMA's Code of Ethics was launched in 1972 and revisions were introduced in July 2004. The Code specifies several basic tenets including: pursuing effective and democratic local government, social responsibility, integrity, improving the quality and image of public service, fairness and impartiality, stewardship of public resources, and political neutrality (ICMA 2004).

## Summary

The brief comparative overview of ethics management measures undertaken in public services across the globe indicates that ethics codes play an instrumental role in countries that are in transition from authoritarian to democratic regimes that pursue New Public Management reforms. While in Central and Eastern Europe ethics codes were initiated to symbolize the government commitment to democratic values and social uplift, in Asian public services, ethics codification efforts are meant to support public management reforms in the face of administrative legacies of strong Confucianism and loyalty to superiors. Ethics management in African countries reflects more a compliance approach rather than building ethical infrastructures that build and cultivate moral character and ethical culture. In developing countries, the purpose of ethics codification is to develop professional identity and growth for public servants that can lead to a more supportive and regulatory environment and increased public trust. Despite the fact that ethical norms and behavior are already embedded and defined in these countries, much is needed to increase the effective use of ethics codes, that is, through ethical training and education to strengthen ethical competence and to monitor the exercise of codes.

# Ethics in Public Service

Lois M. Warner
School of Public Affairs and Administration, Rutgers, The State University of New Jersey, Newark, NJ, USA

## Synonyms

Norms; Principles; Values

## Definition

Ethics is a discipline concerned with right and wrong behavior. It embraces values and principles, which when believed, can influence the character and behavior of individuals and groups, as well as create unity between those who concur. Statements of selected values communicate that they are considered to be meaningful and worthwhile. Ethical value statements are most often intended to be inspirational. An ethical principle is a fundamental idea or theory that provides the basis for ethical behavior and reasoning. Although values and principles vary across cultures and professions, some ethical values, such as honesty and loyalty, for example, tend to be commonly upheld. Similarly, the "Golden Rule," of treating others as you would like to be treated, is an ethical principle found in many cultures.

## Introduction

In public service, ethical values and principles reflect their political contexts and, generally,

emphasize the value of social well-being. Protecting the public interest and advancing public purposes are related principles. In safeguarding the public interest, public service values can include benevolence, empathy, individual respect, and dignity. In advancing public purposes, civic duty, competence, knowledge, skills, and expertise are often used in describing ethical principles. Ethics is an important guiding force toward engendering public service professionalism. Public employees are the trusted stewards of public-owned resources and are, therefore, expected to be ethical and responsible in their management of public affairs. Understanding that ethics is essential for implementing and achieving good governance is important for all public employees.

Public service organizations in many parts of the world are the leaders in delivering indispensable goods and services to their communities, for example, education, health care, law enforcement, and transit systems. The success of related organizations builds on public confidence that they are prioritizing the public interest. When the public service is sensitive and responsive to peoples' needs and expectations and follow through in meaningful ways, they become legitimate and can achieve cooperation and progress in implementing policies that effectively address public problems and contribute to improving the quality of life for citizens. When, however, corruption and scandal are rampant in public organizations, people lose confidence and trust in the public service. These can involve waste and abuse of resources, misappropriation of funds, and various conflicting interests.

Corruption and scandal in public organizations are clear signs of failure in managing ethics. Public employees are sometimes reported for receiving gifts and bribes and for nepotism practices. Even the smallest gifts are given with expectations of reciprocation, and nepotism gets in the way of public organizations hiring the brightest and the best from the pool of applicants. These practices obstruct fair decision-making processes and may affect the public by disrupting or diverting the delivery of goods and services to those who depend on them most. This can be costly to correct, therefore, some governments commit to promoting ethics in the public service by investing in creating ethics infrastructures. An ethics infrastructure comprises rules, institutions, and practices put in place to guide, manage, enforce, and support ethical behavior. They vary across countries, but some common components are ethics legislation, ethics codes, ethics education and training, and putting systems in place for reporting ethical misconduct.

## Ethics Legislation

Ethics management in public service is a matter of international concern. There are several watchdog organizations reporting to the public on ethical misconduct in public organizations. It is increasingly impossible to conceal. Moreover, there is a widespread call for increased transparency and accountability in public affairs. Ninety-two countries across world regions have promulgated legislation in the form of Freedom of Information Acts (FOIA) that allow citizens free access to public information. One hundred and eighteen countries also establish the right of citizens to access public information in their constitutions. Public organizations in these countries must expect public scrutiny and facilitate the implementation of FOIA by putting in place appropriate organizations, administrative procedures, and adequate staff.

Strategies for developing the capacity in public service to prevent and fight corruption include establishing and implementing policies that support proper management of public affairs, integrity, transparency and accountability (United Nations Convention against Corruption 2004). The general consensus among countries is that there is the need to address knowledge barriers about the ethical question of "what is and is not corruption." To prevent corruption in some organizations, there are oaths to be taken by employees as a prerequisite for entering into public service. Some oaths are specific to certain professions, but their general purpose is to have employees declare their commitment to a set of

determined values and principles, with the expectation that their behavior will be guided by them.

Indeed, laws and obligatory oaths provide external constraints on the conduct of public servants. They can, however, present limitations in ethics management, because it would be necessary to have one for every possible ethical issue, and what would public employees do when faced with an ethical issue for which no law exists? Also, from an ethicist's point of view, law must always stand under the judgement of ethics that is based on moral reasoning. Laws are often amended to improve their relevance in a particular place and time. They need to be challenged on ethical grounds to demonstrate commitment to ethical principles over what are considered unjust laws (Cooper 2012). Situations of this kind present public employees with ethical dilemmas, where on one hand they want to be law-abiding, duty-bound public servants, and on the other hand, they are aware of a higher principle that is not reflected in the law. Ethical dilemmas involve deciding between two apparently ethical positions, based, for example, on a duty-oriented approach, *deontological*, and a consequence-oriented approach, *teleological*. Ethicists have found that in practice, it is never possible to separate these considerations (Cooper 2012).

## Ethics Codes

Codes of conduct, like oaths are implemented to establish commitment and to bind employees to public service principles. They are one of the most prevalent mechanisms for managing employee behavior, therefore, a lot has been learned about how best to apply them. They are most effective when written in simple and clear language, but, additionally, employees need opportunities to discuss them, to seek clarification and to understand what actions are expected. It is not sufficient to only include them in a section within an employee handbook, without scheduling occasions for discussion and interaction with other users to allow for sharing and learning from each other's experiences.

Ethics codes, specifically, are known to be brief and general, representing a collective recognition of professional responsibilities to nurture an environment in which ethical behavior is the norm. They set standards, identify duties, and provide principles against which to assess behavior (Bowman and West 2015). Overall, ethics codes have been found to be a positive influence in public organizations for deterring unethical acts and for installing ethical consciousness in those organizations and their employees (Menzel 2010). One important point to emphasize in ethics codes is that, whereas unethical behavior is unacceptable, the mere appearance of ethical misconduct is detrimental to preserving the reputation of public organizations and their employees (Appleby 1973).

Ethics codes can also be the basis for employee workshops and can be incorporated in staff meetings as a point of reference for discussing ethical issues. This practical application accommodates practice in working through ethical issues. One strategy in formulating ethics codes is to do this through a collaborative process, involving employees in determining what public service values they identify with most, which ones they share, what challenges might be faced in upholding them, and how they might be resolved. Ethics codes can then serve as a record of professional consensus (Bowman and West 2015).

## Ethics Education and Training

Educating and training public employees about ethics is a necessity because they will face ethical issues and need to know how to determine, in each case, what is the right action to take. These skills develop over time, and many employees benefit by learning from the experiences of others in the field. Public employees must be familiar with public service values and principles, and with oaths and ethics codes, since they are relied on to a great extent to promote ethics in public service. How oaths and codes are formulated and what developmental activities accompany them should be examined in the context of the organization's challenges in fighting and preventing corruption. This informs of what mechanisms should be included and what methods can be used to promote them effectively. Some important aspects are decision-making models and the inclusion of

the ethical dimensions of tasks in job descriptions (Bowman and West 2015).

The ability to think and behave ethically can also stem from a combination of processes including how one is socialized, for example, culturally, pedagogically, and professionally. Socialization develops over time and can, therefore, be considered while recruiting personnel. Conditions must, however, exist within the public service to allow these characteristics to remain. The culture within organizations provides the context for both ethical and unethical behavior, therefore, exemplars, norms for ethical conduct, and symbols are important components to highlight in organizations so as to nurture environments that foster ethical behavior. In addition to these proactive measures, unethical behavior must be dealt with in ways that deter replication.

Modern technologies facilitate ethics training via the Internet though narrated presentations, podcasts, and videos. These are useful in providing access, for incorporating real-life scenarios, and for standardizing educational materials for similar groups of employees. The strategy with these is to provide exposure to ethical challenges and to how they can be addressed. They can facilitate explanations successfully, by allowing for customization, in that viewing or listening to them repeatedly is possible. But collaborative educational processes offer higher returns toward educating and training for ethics in public service, due to the synergy that participants achieve through sharing and comparing challenges and their experiences in resolving them.

## Reporting Systems

The reluctance among public employees to report ethical misconduct can deter progress in ethics management. Their perceived role in preserving the reputations of public organizations is to conceal any such occurrences. History has shown that when employees expose their organization's ethical failures, they are considered to be disloyal. In most cases, however, it is public employees who identify ethical misconduct in their organizations. Motivated by their ethical values and principles, they choose to suffer the consequences of retaliation and alienation from their colleagues. Reporting ethical misconduct in one's organization is referred to as "whistleblowing."

Calls have been made for laws to protect those who blow the whistle on their organization. The general principle upheld by whistleblowers is to inform people about corruption in the public service that could have dangerous repercussions for them. Some countries have formulated whistleblower protection laws. Some provide incentives for whistleblowing. The best incentive is to have remedial action taken against unethical practices that would otherwise threaten or actually impact the public negatively. This communicates that ethical misconduct is unacceptable and will not be tolerated. It demonstrates that the public service is being responsive and is protecting the public interest.

At the organizational level, reporting systems work internally to facilitate anonymous accounts of ethical misconduct. In some cases they are also set up to receive reports and complaints from sources outside of the organization. The public can sometimes witness unethical practices in the public service and not want to identify themselves when filing a report or complaint to request investigation. Many organizations in more advanced countries facilitate reporting via their websites and feed that information into databases to facilitate analysis of patterns of corruption in public service. When the findings are shared across public organizations, ethics promotion plans as well as anti-corruption strategies can be determined from more informed perspectives.

## Conclusions

When ethics is not a priority in organizations, the results can be the loss of self-respect among employees, tensions between them, higher employee turnover rates, embarrassment for related elected and appointed public officials, and scandal that renders the organization useless and destroys the careers of public service employees. Clearly defined and well-coordinated ethics infrastructures with continuous evaluation and improvements can be helpful in avoiding ethical failures and their severe and far-reaching

consequences. In this regard, the role and function of an ethics liaison officer in public organizations are growing in recognition and importance in the public service. Some public administration university programs already include ethics as a core course. Assigning to an ethics liaison officer the responsibility for maximizing the potential for oaths and ethical codes to promote ethical behaviors, monitoring compliance with ethics legislation, developing related ethics education and training, and managing ethics reporting systems augur strongly for this as a specialization within the field of public administration.

## Definition

*Ethics*, frequently equated with *piety* and *civic virtue* or even with *utility* and *prudence*; defined by Aristotle as "something manifested in making personal choices."

## Some Further Definitions

In some of his discourses timed around the death of Socrates – *Phaedo*, *Crito*, and the *Apology* come to mind in this connection – Plato brings the idea of the *soul* to bear on the discussion of right conduct, ethics, and virtue. Defined in these discourses as the best part of our self, this idea of "soul," related to the concept of immortality, was destined to prove catalytic of many transformative changes in the evolution of European thought, all through the ages. Specifically, the belief that all humans, individual men and women, irrespective of ethnicity, gender, age, or social status, partook of a shared essence which defined them all as members of one *civitas humana*, later served as the foundation of an expansive doctrine on human rights as the *inalienable* entitlements of all people without any distinction whatsoever. In our lifetime, this idea served as the cornerstone of the United Nations and its system of specialized agencies, as well as a point of departure of many postwar movements, including decolonization, campaigns for civil rights, gender equality, "wellness" for all, and inclusion, where these had been neglected or denied. Barriers, which had been erected and sustained since time immemorial, rapidly eroded and crumbled under the mighty impact of an idea which saw the light of the day during the Axial Age (Dror 2001, pp. xiii, 15), which covers Plato's days but also those, before him, of Cyrus the Great of Persia, Confucius of China, and major Hebrew prophets. It needs to be remembered that it was Cyrus the Great who

sponsored a Universal Charter of Human Rights and Bill of Nations, which abolished slavery and established human rights for all people regardless of religion, ethnicity, culture, color, or race. He founded a system of government and administration based on tolerance, justice, professionalism, and respect for all (Olmstead 1948).

A forceful affirmation of the dignity and worth of the human individual, this idea of rights was also a limitation on government prerogatives – limitations both to *what* governments might do and the *ways* they chose to employ. Concepts like the rule of law, due process and habeas corpus have their source and draw their strength from an elusive principle which provides the foundation of democratic that, very simply put, ends *do not* justify the means. Underpinning civic rights, the very same idea served also as an acknowledgment of a responsibility requiring men and women to stand up for those principles and rights; to *resist* unsustainable claims, unjustified demands, and the abuse of power; to question arbitrariness and refuse to obey commands; or to surrender to blandishments that clearly contravene a global moral order to which most people adhere but clearly do not practice. Socrates, in his *Apology*, was one among the first in all historical record to stand up for his rights and pay the price, accordingly. His memorable words deserve to be quoted in full. They really are the basis and quintessence of ethics:

> Men of Athens, I honour and love you; but I shall obey [my conscience] rather than you and, while I have life and strength, shall never cease from the practice and teaching of philosophy, exhorting anyone whom I meet, after my manner . . . saying: O my friend, why do you, who are a citizen of the great, mighty and wise city of Athens care so much about. . . money . . . and reputation, and so little about wisdom and truth?
>
> Plato "The Apology of Socrates" from B. Jowett (2004): *The Trial and Death of Socrates* (p. 33)

## Introduction: Ethics as Freedom of Conscience

In days, when compliance with orders and conformity to wishes of those in positions of power are portrayed as "goods in themselves," there is a pressing need to defend the freedom of conscience, to take responsibility for difficult ethical choices, and to "speak the truth to power." From the days of antiquity onward and truly across the world, the value and virtue of ethics have lain in difficult choices and the duty of men and women to make them undeterred by mercenary or extraneous considerations. Ethics is predicated on tolerance, respect, compassion, and moderation. More than anything else, it seeks to refine or activate the personal responsibility of individual agents, for commissions or omissions, which represent decisions that they have either taken or in which they acquiesced. It represents a challenge that our world has to face.

The progress of globalization brought in its trail the rise of the market model of governance (Fraser-Moleketi 2015, pp. 14–18). Emerging in the 1990s, it found concrete expression in the *Washington Consensus* and the policy pronouncements of the Bretton Woods Institutions. More than anything else, it envisioned the "shrinking of the state," downsizing social services, outsourcing, and deregulation, thus redefining government preeminently in terms of foreign policy, defense, homeland security, and the administration of justice (Friedman 1993). In turn, this model of governance engendered a system of values which, therefore, we may call the *market model of values*. In light of this new model, values defy definition because *it all depends*. Like stocks and shares, they shift according to circumstance and subjective considerations but, most of all, *utility* to government or *self*. Perceived short-term advantage, expediency, and effectiveness, which have a place in business, invaded other fields to which they are less appropriate, yielding mostly unavowed, yet often dysfunctional, outcomes. Thus, university faculty spend time to find a *niche* and "competitive advantage," while public organizations amend their programs of action, not according to the claims or needs of their end users but in light of insistent demands from rich or powerful patrons. Politicians change their tune based on the latest polls. The value and the virtue of devoted public service have gone by default.

Not surprisingly, the many dysfunctional outcomes produced in this environment have spurred a renewed interest in ethics as a field. Courses on ethics abound. However, they have tended to be mostly self-serving, eschewing fundamentals, conforming to company policy and, to all intents and purposes, situated well within management's comfort zone. True, such courses have a place insofar as they seek to foster civility and civic virtue. They serve a valid purpose, advancing the *work ethic*. However, their propensity to defend the status quo and push for compliance to orders must now be called into question. The sum of human experience, during the past one century, is replete with telling examples of the risks of unswerving loyalty and blind obedience to orders. Furthermore, as will be shown, discourses on ethics (and policy) have long been vitiated by a pronounced proclivity to bifurcate humanity, pitting the forces of "good" against the forces of "evil," subjecting such discourses to ex parte, subjective criteria. Ethics is objective, rational, and universal, not predicated on preferences with regard to particular agents. It invites us all to transcend utility and self-interest, even deep-seated loyalties underpinning civic virtue. Its role should be to strengthen our individual sense of "right" and "wrong" and personal responsibility in the face of difficult choices. It should reinforce capacity to wrestle with our conscience, resist wrongful commands, and follow through with decisions, which we consider moral, tenaciously if we must.

## Must Virtue Be Beholden to the Whims of Warrior Gods?

It took place in early March of 2015. Colleagues of John Jay College were lining up to board a flight bound for Chicago in order to attend the ASPA National Conference and to present their papers, at one of the panel events. Suddenly, rumors spread that a runway had been blocked and most of the flights canceled. Heavy snow, which may have caused an accident, continued throughout the day, stranding hundreds of passengers, who finally resigned themselves to spending the night at La Guardia and simply hope for the best.

Unprepared for this turn of events and unsure of prospects for travel, most passengers were trying to fall asleep on a chair or on the floor Straining to fall asleep, they were regularly awaken by big red letters flashing:

> *Welcome to La Guardia Airport – God Bless Our Troops*

There were visibly no troops, to whom this might be addressed but plenty of time to fathom the import of this message, ostensibly directed to all. All felt welcome at La Guardia but why this invocation of the Almighty? Most people, whose career in public service, national or international, began with a stint in the military, would be surprised to read on public billboards "God bless our public servants," "our teachers," "our policemen," or "fire fighters," though quite a few, like "Doctors Without Borders," have sacrificed their lives in the line of duty.

Historically, the military have been accorded kudos, which few civilian groups or other great professions have received. More generally, the esteem accorded to professions has varied over time among occupational groups, as well as different countries. The authority and prestige enjoyed by doctors, lawyers, and public administrators, in some parts of the world, has not been matched in others. Perhaps, one would agree that all the great professions have had their share of excellence and wretchedness or evil. Their fortunes oscillated and share of public trust also known its ups and downs. Though surely many factors account for these fluctuations, it would be fair to argue that *values* demonstrated in the application of knowledge, competencies, and skills by members of a group or a profession have played a pivotal role in shaping public attitudes. *Ethics is the litmus test* and, therefore, also the focus of this paper, which tries to explore the subject in historical perspective, as well as a contemporary context.

Historically, the military, as either citizen soldiers or mercenaries, have represented power and, therefore, accorded kudos. Significantly, it was "China and Korea [which] witnessed an early

decline of the martial aristocracy compared to the West, Japan, and other civilizations." The Confucian elite, which ascended to positions of influence and prestige through competitive examinations, had, by the fourteenth century, largely replaced the martial warlords (Kim Sangjun 2002, pp. 57–59). In much of Europe, by contrast, successive generations vested implicit trust in the valor and integrity of their armed forces. Incessant wars may account for this implicit trust, which some lived to regret. Thus, during World War II, in the Nazi-occupied Greek city of Thessaloniki, a leader of the sizeable and threatened Jewish community could still affirm his faith in a senior "officer's word." Few members of his community survived the War to question this misplaced but deeply ingrained and widely shared belief in the virtues and integrity of certain great professions and of their members (Asser Pardo 2005, pp. 40–41).

After World War II, not only in Latin America but also on other continents, uprisings orchestrated by military juntas abolished constitutions, establishing corrupt and dictatorial regimes. Invariably, the excuse for mounting coups d'état was the time-honored dictum also abusively invoked *salus populi suprema lex* ("saving the people is the highest law"). Seldom have such unorthodox processes led to good long-term results. Still, to this very day, quite a few countries suffer from the dysfunctional outcomes of plainly extraordinary, illegal, and unethical actions purportedly undertaken in the name of higher causes and overarching goals. The greater glory of God or "existential threats" and "vital national interests" are the "causes" commonly invoked to influence public opinion, in this regard.

## Ethics and Civic Virtue as Guides to the Perplexed

Civic spirit, civic virtue, and civility form parts of a *continuum*. They are the opening stages of a discourse on ethics. All of the above imply a degree of altruism and abnegation, surrender of self-centeredness – "me first," in other words – in favor of community, humanity, and the greater good of all. In practice, nonetheless, they are limited in scope, in time, and in space, to a specific context. Exercised within the bounds of a particular country, company or institution, and changing circumstances, they may entail devotion to a person or a country and institution that goes beyond the bounds of reason, resulting in surrender of personal critical judgment, as well as of ethical standards. Countries and organizations, as well as supervisors, to whom all are beholden, may have competing agendas. In all too many cases, they call them "vital interests," appropriating "right" and even the Almighty for their cause. It goes without saying that neither God nor history is always on one side, one's own, as one might hope, and that of adversaries, who may stake similar claims. Therefore, resolving differences through accommodation and compromise is preferable to fighting, however "noble" the "cause." Perhaps, the time has come to quit an old tradition that goes back many centuries of dueling and crusading, bifurcating the world into two rival camps both clamoring for blessings from the Almighty and history.

Though there is no denying the immanence and prevalence of "good" and "evil" in the world, they are hardly separated as neatly as many think. They seldom coincide with vital national interests, which make demands on people that oftentimes defy both logic and ethics. What, invoking civic virtue, many like to call *patriotic* may well not constitute an *ethical* course of action (Abrams 2016, p. A27). Consideration of ethics sets strict limits on one's duty either to the "Queen and country" or to a religious community. Its value lies precisely in the confines it places on age-long ways of thinking and mind-sets that we inherited or that we internalized as members of ethnicities, of companies, or of teams. Ethics, indeed, invites all to transcend such common ways of thinking and to reach to higher levels of truth and objectivity, consistency, and humaneness. This is, plausibly, where courses which, in the name of "ethics," teach company policy and practice fall short of their stated objective. Though they may help staff members, when duly equipped with guidelines, to eschew avoidable errors and reach decisions consonant with management's

desires, they really teach loyalty, expediency, and effectiveness, *not* ethics (Argyriades 2014).

Not all decisions of governments – or management – could be called really "ethical" or need pretend to be ethical. Simply, they march to a different drum. Some are merely tactical ploys, either responding to pressures or driven by expediency and perceived opportunities. Sometimes, strategic decisions and related courses of action may be considered virtuous in the measure that they are consonant with the long-term public good, provided that they entail no harm, nor cause "collateral damage" to "innocent bystanders." Notoriously, a decision that is taken irrespective of its long-term effects (*après moi le déluge*) can hardly be a decision one could consider virtuous. Nor "beggaring" one's neighbors, "robbing Peter to pay Paul," or profiting from trade in weapons, drugs, and humans would be considered tolerable, morally speaking, noting the widespread suffering, which they inflict. Sadly, one needs to admit that all too many decisions of governments and leading entrepreneurs fall into this category. Most respond to calls or claims emanating from stakeholders, constituencies, or lobbies, to which they are beholden. Often actions are portrayed as taken in response to noble causes or "vital national interests" invested with significance, which they all too often lack. Few are true acts of statesmanship (Brooks 2016a, p. A27).

In most cases, acts of statesmanship are granted recognition in retrospect. In retrospect, they win a highly merited place among rare steps that changed the course of history. Such were the great reforms of the early twentieth century and the postwar decades. One thinks of the New Deal (Newland 2015) and the civil rights legislation (Berman 2015), in this connection. They manifestly righted historic wrongs in the USA, and this without inflicting adverse effects on others. They plainly represented a righteous course of action, outputs of civic virtue. One needs to draw a distinction between such courses of action and acts, inherently wrong, mostly taken under cover, hidden from public view, which are explained away, if ever brought to light, as taken in the name of transcendental causes: *faith, fatherland, or freedom*.

Throughout the course of history and all around the world, walking that extra mile in service of one's country has generally been viewed as proof of civic virtue. And broadly speaking, it is especially when action is manifestly taken in the defense of freedom or in constructive projects that benefit society and humanity at large. In retrospect, however, one also needs to admit that all too many wrongs were committed in the name of noble causes. Still today, several men and women are influenced by a long tradition equating civic virtue with patriotism and the latter with bravery at war. The Romans used to say, exhorting their youth into battle, *Dulce et decorum pro patria mori* ("It is both sweet and proper to die for one's country," *Horace, Odes III, 2, 13*).

Analogous expressions can be found in other cultures, coming from times in history, when waging war was a sure proof of manhood and warfare a way of life (Argyriades 2014, pp. 56–57). But times have changed and so has the nature of warfare. It is highly asymmetrical, with the one-sided use of cutting-edge technology, compelling all accordingly to revisit and revise some ancient values systems, including definitions of "heroism" and "valor," which may not correspond to contemporary realities (Nagel 2016, pp. 3–6).

Already in the 1700s, Dr Johnson ventured to question the merits of these values or the forms they commonly take, in an aphorism describing patriotism as "the last refuge of the scoundrel." There can be little doubt that, bereft of civic spirit, civic virtue, and moderation, what many would call patriotism comes perilously close to closure and ethnocentrism, giving vent to hollow expressions of bigotry and complacency or, worse still, demagoguery. In an age of globalization, people need to go much further in surmounting limitations in their ways of thinking, which are a thing of the past. In fact, these limitations are plainly forms of *relativism*. Must all standards and all values be subjected to this test? Can one say of heinous actions that they are "OK" when committed in one's favor or one's name, but not so, if perpetrated by others, to the benefit of others, whom we happen not to like? Can it, in all sincerity, be argued that egregious acts of violence or aggression migrate to a higher sphere when

undertaken on orders from a superior authority to which one is beholden but not if authorized by a government, which one considers unfriendly?

It has been said before but bears repeating: the world is changing rapidly bringing nations and religions to an ever closer proximity. In this new world environment, bifurcation of the world between the *good* and the *evil* or between *civilization* and *barbarism* makes very little sense, though it still clouds people's reasoning on ethics. One hardly needs reminding that there are shades of gray, not merely black and white. The same that form the light are also creators of darkness; the same that bring the peace can also be the aggressors (Isaiah 45:10). There is no drawing the line. It's people's *actions* that matter. With the wisdom of hindsight and some tragic history lessons, one should really know better than believe in a City of Light beckoning from on high while fighting the "Evil Empire." A figment of imagination often couched in chauvinist rhetoric, it does more harm than good. The fact is that most continents and nations have, at one time or another, been the source of both noble deeds and shining examples but also egregious acts. Now, however, people live in a world of relative openness, of speed of information and rapid interchange. In this world – our world – dialogue, accommodation, multilateral negotiations, and cooperation offer the better course in conflict resolution, in dealing with diversity but also in addressing the mounting global challenges of the twenty-first century. The needed machinery exists through the institutional framework of the United Nations, though reinforced it must be. Likewise, the requisite know-how, technology, and experience are available. They need to be used to good purpose. Mostly, people lack the will and choose short-term expedients of dubious propriety, over a wiser course.

For several decades or centuries indeed, the world has been the victim of myths, of spin, and of stereotypes. These have fomented prejudice and perpetuated closure. Perhaps, the time has come to move beyond such stereotypes. *Ethics is there to help*, for it begins with reason and removal of all barriers that promote the closure of minds. It is an invitation to dialogue and exploration. Intrinsically, ethics is rational and global, objective and universal, the same for all humanity. Of course, this is hardly surprising. It has so been considered for more than two millennia; thus with the Golden Rule, in other words the injunction not to do unto others what people disapprove of or would not like to suffer *from others in their hands*. Profoundly democratic and egalitarian, it goes back to the dawn of our era, which also saw the emergence of proto-globalization. Attributed to Hillel, it later found expression in the Gospels (Dimont 1962, pp. 43–44; Cohen 1985, pp. 18–27). Like the principles proclaimed by prophets like Isaiah, philosophers like Plato sages like Confucius, their scope is clearly global and universal, whatever the audience was, in ages past. Of very special moment to public servants in the injunction of Confucius: "[w]hat a man dislikes in his superiors, let him not display in his own dealings with his inferiors; what he dislikes in his inferiors, let him not display in his service to . . . superiors" (Lin Yutang 1966, p. 147). Properly understood, such principles are sound and *intrinsically* valid, not conditional, in fact, on fleeting circumstances or criteria of time and place.

## Conclusion: Ethics as Transcendence

Ethics invites *transcendence*. It takes the concept of duty onto a higher level. Its vital role consists in going beyond the ordinary, beyond compliance, conformism, loyalty, and obedience. Its target is to build both will and capability to question and to challenge accepted norms of conduct and belief systems. Of course, it needs to do so in ways that are constructive, as well as fully respectful to other people's dignity, convictions, and beliefs. With empathy and civility, ethics can also foster rigor, consistency, integrity, fortitude, and self-discipline. On the study and practice of ethics, public servants depend to develop and to strengthen the requisite sense of *autonomy*, equipping themselves with a compass that shows the way to duty beyond facile beliefs, beyond unquestioning loyalty, and beyond what they are told to do. Ideally, ethics teaches all to think for themselves, but also to *think out of the box*, charting a righteous course and persevering with it through

thick and thin, if necessary. People are shown the way to wrestle with their conscience; arguably, one could say, the way that Jacob wrestled with God – or an angel – in the Bible (Gen: 32.4). They should wrestle with their conscience and, like Socrates, learn to reject commands from "higher authority," which must be considered improper, inhuman, and unethical, although they may purport to be promoting causes seemingly right on surface. One hardly needs reminding that, in the distant past but also in our days, a few too many crimes have been committed in the name of noble causes.

Indeed, it may be argued that the weightiest contribution to democratic governance that ethics has proffered is the duty to say "No," when faced with immoral commands. It is a lesson in critical judgment, a lesson in the capacity to question and debate, if need be, to reject either a tempting offer or a threatening command. Intrinsic to ethical conduct is the courage to resist intimidation which, if one were to surrender, would entail a contradiction with what, deep down, one knows to be the righteous course. Already in classical times, Socrates offered an example when, as presiding officer of the Assembly of Citizens in Athens, he resisted pressures upon him and refused to cooperate in passing a resolution, which he considered unjust, as well as ill informed (Barker 1952, p. 86). The life and death of Socrates provide telling examples of what the practice of ethics and ethical living entail. For Socrates and Plato, the foundation of ethics lay in knowledge and self-knowledge or what Socrates defined as *gignoskein auton eauton* (Barker 1952, pp. 124–125). It was the point of departure in building up steadfastness in the pursuit of justice and courage in the practice of righteousness and equity. Accordingly, in *Protagoras*, Socrates discusses risk taking, which is essential to valor, arguing that it should reflect not foolhardiness, but rather conviction grounded in knowledge and wisdom (Vlastos 1978, p. 7, et seq.).

Contemporary history offers numerous cases corroborating lessons, whose source lies in antiquity (Brooks 2016b, p. A27). The World War II, in particular, abounded in examples of fortitude displayed by women and men of all nations engaged in resisting aggression from a perverse regime renowned for its brutality. Although one might have hoped that we have turned the page and that, with the foundation of the United Nations, we might have put an end to the savagery of war, events in recent years rather defy such optimism. We have not seen the end of evil deeds, often committed by people who claim that they mean well. What is more, in the past 30 years, we have witnessed the surge of a doctrine and triumph of a mind-set which, in the name of *pragmatism*, have made short shrift of ethics. They pay lip service to ethics but hollow it out of meaning, subjecting it instead to the utilitarian calculus of expediency and effectiveness. Allied to this approach is an alarming tendency of governments and individuals to look the other way or quietly dispense with ethical standards, when ethics would command a different though, arguably, more challenging and more demanding course. Bolstered by modern technology, such dangerous proclivities pose considerable risks for democratic governance and world peace. They need to be resisted.

Ethics and civic virtue are rooted in the bedrock of human civilization and philosophic discourse. Overtime, a global consensus has emerged as a result. Developed, through the ages, by seminal thinkers and statesmen, it has furnished the underpinnings for some of the highest accomplishments in institution building during the past two centuries at any rate. One may think, in this connection, of parliamentary systems, of the United Nations, and of other international organizations promoting peace and development. It offers surer guides to public servants than contrary ideologies built mostly on shifting sands over the past four decades, let alone the bitter lessons of WWII.

By way of summing up, the author of this article may be excused for drawing on experience close to home, from his native country Greece, which endured a harsh occupation during the World War II. The case, which follows, brings into sharp relief deeply contrasting attitudes and corresponding conduct by four members of the *Wehrmacht*. To this day, the names of two are remembered – inter alia – for zealous participation

in the brutal repression of people and deportations to Auschwitz. The first was Adolf Eichmann, whose record aptly inspired Hannah Arendt's telling title *The Banality of Evil* (Arendt 1963). The second was none other than Kurt Waldheim, later Secretary-General of the United Nations. He studiously concealed all evidence of his wartime activities in Greece and Yugoslavia pretending, later on, that he had spent those years studying law at the University of Vienna. Two others, though they remain anonymous, are remembered in deep gratitude, for skirting ruthless orders and looking the other way, thus letting innocent victims escape against all odds (Asser Pardo 2005, pp. 65–66; Argyriades 2014, pp. 80–81).

What conclusions may one draw from these contrasting attitudes and starkly disparate conduct? On the one hand, one notices the unquestioning obedience of two individual officers mature enough to know the full scope of the activities in which they were engaged, yet either out of loyalty or personal ambition, taking cover under orders and choosing to execute them with the most consummate zeal. They may not have expected the War to end as it did, but is this really the issue? Can one say that Allied victory and not inherent perversity made the conduct of these officers, as well as their activities, infinitely reprehensible – indeed criminal in nature? The two anonymous heroes offer a contrasting model. They must have been aware that, had they been found out and their disobedience detected, they would have been court-martialled and made to pay with their lives for their transgression. *In adversity*, they dared to take the righteous course, though perilous it was. They ignored perverse instructions. Embracing responsibility for their actions rather than meekly cower under superior orders, they made themselves exemplary of ethical and of heroic resolve. Like Socrates of old, they listened to the voices of reason and their conscience. We term their conduct ethical and exemplary on this ground. May we, therefore, consider the needed task of nurturing a sense of right and wrong and, with it, moral fortitude and personal responsibility as the ultimate calling of ethics?

# Ethics in the Public Sector

Patricia B. Robertson
Southern University at New Orleans, New Orleans, LA, USA

## Synonyms

Conflict of interest; Efficiency; Fairness; Government; Leadership ethics; Moral codes; Political ethics; Principles; Public servants; Responsibility; Transparency; Values; Virtues

## Definition

Ethics in the public sector are moral principles that govern those in the public sector. The public sector is the portion of the economic system that is controlled by national, state, provincial, or local governments.

## Introduction

Public sector ethics is a broad topic and can vary between cultures. In spite of the differences, there is a common ground of what is considered good and correct conduct with ethics. Much of the work done by political officials, whether elected or appointed, involve choices among values. Therefore, it is very important that the body politic be technically competent as well as ethically literate. Ethics is a key component of good governance (Perry et al. 2014). The ethics displayed by leaders, known as leadership ethics, has a moral dimension because leaders influence the lives of others. In recent years, there have been a massive number of scandals in the public and private sectors. There have been financial scandals that occurred at some of the largest companies in the world, including Adelphia, Enron, Tyco International, and WorldCom. Additionally, there have been many cases of sexual abuse and assault in churches as well as the US military and a multitude of sex scandals in the lives of public figures including governors, mayors, senators, and others. Because of these high-profile scandals, people are having less trust in public figures and what they do. The public is in great need of moral leadership. The American Society for Public Administrators (ASPA) has adopted a code of ethics. According to ASPA's Code of Ethics, public administrators are to "serve the public, beyond serving oneself"; to conduct themselves in a manner that inspires "public confidence and trust"; to strengthen organizational "capabilities to apply ethics, efficiency, and effectiveness" in serving the public; and to exercise discretionary authority "to promote the public interest." According to Kinchin (2007), the ethics of public service is based on five basic virtues: fairness, transparency, responsibility, efficiency, and no conflict of interest.

## Leadership Ethics

Leadership ethics is the influence of a moral person who moves others to do the right thing in the right way for the right reasons (Ciulla 2002). According to Peter G. Northouse, there are six factors that determine leadership ethics. They are character, actions, goals, honesty, power, and values.

*Character* is something that is developed. A leader who has character sets a moral and ethical code and through integrity lives according to that code. They lead by example. When practiced over time, good values become habitual and a part of the leader. By telling the truth, leaders become truthful. By being fair to others, leaders become just. In other words, the character of a leader is derived from the actions depicted. An example of a leader with strong character is Nobel Peace Prize winner Nelson Mandela. Mandela was a deeply

moral man who fought for what he believed was right. He was unyielding in his pursuit of justice and equality for all. He refused an offer to be released from prison to denounce his viewpoint. He chose to remain incarcerated than to compromise his position. Mandela clearly illustrates that character is an essential component of ethical leadership.

*Actions* refer to the ways a leader goes about accomplishing goals. Since the public sector focuses on public interest, ethical actions of leadership are critical to maintain the best interests of the public. A leader can act in different ways to accomplish goals, and each of these actions has ethical implications. An example of ethical implications for taking the wrong actions can be found in the many bribery cases undertaken by public figures. Such examples include New York State Senator Carl Kruger who was caught taking bribes to keep Walmart out of New York City, along with seven other people in 2011. He was accused of taking $1 million in bribes in return for supporting legislation and asking for favors for those who paid. He was sentenced to 7 years in prison. Another example was Moreno Valley City Councilman Marcelo Co who was caught on tape taking $2.26 million bribe from an undercover FBI agent. He pled guilty to bribery and tax fraud. Final example on bribery was Representative William Jefferson in 2005 who was videotaped accepting $100k from an FBI informant. He was indicted on 16 felony charges and received 13 years in jail, the longest sentence for bribery. There are many more examples. These public figures used the wrong actions to accomplish their platform. These actions have caused many to have very little trust in our public leaders.

*Goals* are desired results or possible outcomes that a person or a system envisions, plans, and commits to achieve. Goals that a leader establishes or the way that the leader uses goals to influence others says a lot about the leader's ethics. Identifying and pursuing just and worthy goals are one of the most important steps an ethical leader will undertake. A good example of a positive goal would be that of Mother Teresa. Her goal was to help the poor and disenfranchised. In similar fashion, Habitat for Humanity's goal was to build houses for the disadvantaged. In choosing goals, an ethical leader must assess the relative value and worth of his or her goals. In the public arena, it is very important for the leader to take into account the interests of the community and larger culture in which he or she works.

*Honesty* is a quality that most people look for from their leaders. Honesty deals with telling the truth but it is not just about telling the truth. It also has to do with being open with others and representing reality as fully as possible. A survey was given by a *Fortune*/Morning Consult poll that asked the question "what do citizens look for in political leaders?" This question was asked to 2071 registered voters who were instructed to pick two out of a list of qualities that they deemed most important in a good leader. The list consisted of a number of traits such as confidence, creativity, wealth, and whether a leader was admired by all. Based on the survey, two leadership qualities stood out among the rest: honesty and integrity.

Honesty in public leaders is regarded as very important because leaders that display dishonesty can lead to other negative actions.

*Power* is the ability to influence the behavior of others with or without resistance by using a variety of tactics to prompt action. Leaders can use power to benefit others or constrain them, to serve the organization's goals, or to undermine them. Great leaders have the following in common; they have a vision to accomplish large-scale ideas that they dream of accomplishing, and they have the personal power to enact it (Gibson et al. 2012). For example, the late Steve Jobs of Apple Computer and President Barak Obama had strong visions of the future. They were able to transform their visions into reality, because they had acquired and used the necessary power to do so. Great leaders make things happen by utilizing personal power (Pfeffer 2011). Many of Steve Jobs workers in the workplace described his strongest tactics in the workplace for getting the job done was his inspirational appeal. The inspirational appeal is mainly to have the ability to propose tasks from employees using tactics that are designed to increase the workers' enthusiasm and appeal (PSU WC, L7). Job's ability to push his workers beyond their limits came from his ability

to make them believe they can do extraordinary work in a short period of time which many deemed to be impossible; this was called Jobs' reality distortion field (Issacson 2012, Pg 4). President Obama was good at using his power to move his agenda forward from a leadership perspective. That is the acid test of leaders: getting things done. Obama's healthcare reform has been cemented by the Supreme Court. Gay marriage is legal in every state. The United States is less dependent on foreign oil than it was when he became president.

*Values* are the guiding principles of our lives. A leader who leads by example is displaying values. If the organization's leadership has a code of conduct and ethical expectations, they become an organization joke if the leaders fail to live up to their published code. Leaders that exhibit ethical behavior powerfully influence the actions of others. Leaders should choose the values and the ethics that are most important to them, the values and ethics that they believe in and that define their character. Then leaders should live them visibly every day at work. Living your values is one of the most powerful tools available to you to help you lead and influence others.

## Political Ethics

Political ethics (sometimes called political morality or public ethics) is the practice of making moral judgments about political action and the study of that practice. As a field of study, it is divided into two branches, each with distinctive problems and with different though overlapping literatures. One branch, the ethics of process (or the ethics of office), focuses on public officials and the methods they use. The other branch, the ethics of policy (or ethics and public policy), concentrates on judgments about policies and laws (International Encyclopedia of Ethics).

*The ethics of process* was first acknowledged by Italian Niccolo Machiavelli. Machiavelli believed that a political leader may be required to commit acts that would be wrong if done by the private. This idea by Machiavelli seems to have given political leaders the right to conduct themselves unethically in many situations. Theft by political leaders is very prevalent. This includes stealing everything from land and buildings, to vehicles and aircraft, and to office equipment and furniture. One of the more serious but subtle acts of theft by public officials is theft of public property. Such theft can range from taking home supplies to stealing millions of dollars from the public purse. Fraud is one of the most common, and costly, forms of theft by public officials. This type of theft is done by deception and trickery. Fraud occurs when an individual deliberately deceives others in order to unjustly gain money, property, or services. In the past decade, there have been so many cases of theft and fraud which has really caused citizens to not trust political leaders. Just in New Orleans alone, there have been more than 20 cases of theft and fraud in the past 3 years where the public official was convicted. One such case is the executive director of New Orleans Affordable Homeownership, a quasi-city agency that steered public money to pay for repairs to storm-damaged homes, including hundreds of thousands paid out for work that was never done and thousands more that was paid back to executive director as bribes. Another case involved New Orleans 60th mayor who was prosecuted for fraud and bribery. There's a publication named "The Louisiana Politicians Hall of Shame." When public officials do wrong, the whole community suffers. Machiavelli theory has proven ineffective. Other types of unethical behavior by public officials include improper use of government property, influence peddling, conflict of interest, self-dealing, divulging confidential information, and immoral conduct.

*The ethics of policy* in political ethics asks what conclusion should be adopted as policy and coercively enforced as law when citizens reasonably disagree about the values at stake or when they sbelong to different communities and nations. Some policies included are social policies, religious policies, medical policies, and political policies. Most religions have an ethical component, often derived from purported supernatural revelation or guidance. The meaning of social ethics is a set of rules or guidelines, based around ethical choices and values that society adheres to. Many of these rules are often unspoken and instead

expected to be followed. Medical ethics is a system of moral principles that apply values and judgments to the practice of medicine.

## Conclusion

The actions of leaders are important in promoting good conduct and fostering an ethical culture. Ethics is a key component of good governance (Perry et al. 2014) and has significant potential to affect public trust in all forms of government (Joyce 2014). Government officials serve the people and manage the resources of others. The public expects public officials to practice fairness and equality when conducting daily activities. The United States office of government ethics was initiated by the Ethics in Government Act of 1978 to provide leadership and policy direction for an ethics program in the executive branch of government. Many lives are affected either positively or negatively everyday by the actions of public officials. The concept of Niccolo Machiavelli of how a public official should act to maintain control and power conflicts with the underlying principle of being a steward to the general public. As such, this treatise is a springboard for ethical issues in modern times. Paul Douglas argues that ethical practices are needed because our government is now so huge and affects our lives so directly that we cannot be content with merely a moderately decent level of behavior on the part of our public officials. For even a small percentage of misbehavior on the part of these public officials can do a vast amount of harm.

## Synonyms

Ethical; Ethical environment; Ethics; Ethics codes; Ethics policy; Ethics program; Ethics training; Moral; Morality

## Definition

Ethics measures are the programs and policies put in place intended to improve and protect the ethical environment in a public institution or agency.

## Introduction

Creating a positive ethical environment in public institutions and agencies involves a host of complicated factors. Among them are ethical leadership and management, institutional focus on ethical values, robust and enforced ethical dimensions to hiring and advancement decisions, institutional and agency response patterns to reports of

ethical violations, and a host of other interpersonal and institutional factors often difficult to define. However, specific measures enacted to achieve this goal in public agencies have primarily been comprised of two categories: ethics codes and ethics training. These can come along with some less widespread measures such as reporting hotlines, ethics audits, and the designation of compliance officers or ombudsmen. These last measures have not been studied independently of the first two, and have primarily been studied as elements in a wider measure of "ethics environments," for instance, in the National Governmental Ethics Survey (Harned et al. 2007). This article will focus primarily on the first two, most common, measures.

As ethics codes and ethics training have become a core element of government reform around the country (Berman et al. 1994; Kaptein and Avelino 2005; Feldheim and Wang 2004) a host of questions arise for those interested in the functioning of public institutions. How widespread are such measures? What is the content of ethics codes and training? And what should it be? What kinds of training methods are being used? And what are the most effective? What is the impact of these measures and what metrics should be used to evaluate them? Can they significantly improve the ethical environment? Can they modify behavior or institutional culture? Can they reduce ethical violations? How do they work together or independently? What factors influence the amount of impact they have? A significant body of research seeking to address these kinds of questions has been focused on the private sector, corporate, and organizational ethics. However, an independent focus on ethics measures in the public sphere is beginning to emerge (Van Montfort et al. 2013).

This independent focus is crucial because the public and private sectors diverge in multiple ways that are fundamental to the ethical functioning of individuals within those spheres. We can begin with the normative dimensions elucidated in political theory as specific to the public sphere: the public agencies' claims on the legitimate monopoly on the use of justified coercion, the use of this coercion to regulate citizens' most fundamental ethical beliefs about the nature of the good life (one's personal politics), a public mandate to represent all-encompassing public interests as opposed to the mandate in the private sector only to represent limited private interests, the limited versus almost limitless pervasive impact on constituents' lives, and, finally, the voluntary membership in private enterprises (as employee, customer, owner, stockholder, etc.) versus the involuntary membership that citizenship represents for all natural born citizens (Rawls 1971). Further, the public sector diverges from the private sector on a number of significant organizational and cultural dimensions. These differences can be found in market exposure, a distinct set of legal and formal constraints, oversight by the public, political influences, etc. (Boston et al. 1996).

The purpose of this entry is to provide an overview of relevant research in the area of ethics measures and their impact in the public sphere. The overview will begin with basic information about implementation rates for ethics codes and training at different levels and in different settings in the public sphere. From there the discussion will move on to the varying content of these ethics measures. Finally the discussion will center on what is known and (perhaps more importantly) what is not known about their impact.

## Implementation Rates

Adoption rates for ethics measures in the public sphere vary widely. Let begin with ethics codes. The Ethics Resource Center's National Governmental Ethics Survey (NGES) (Harned et al. 2007) found that 98% of federal government employees identified their agency as having a "Code of Conduct." A nationwide survey of ethics codes at the state level found that almost all states had an ethics code (Blake et al. 1998). Many even have "separate codes and systems of implementation for the executive, legislative, and judicial branches," but this is a relatively recent development, with most states having implemented ethics codes within the last few decades (Lewis and Gilman 2005, citing Freel 2003). While

ubiquitous, these state ethics codes were generally limited in their content (Blake et al. 1998).

At the municipal level, where such measures have received the most attention, a survey conducted in 2002 by West and Berman (2004) found that, of cities with a population over 50,000, approx. 7 of 10 cities had a code of ethics. Feldheim and Wang (2004), surveying the same universe in early 2000, found essentially the same result. No nationwide sampling of smaller municipalities is available. However, the Missouri Municipal Ethics Survey (Siewert and Udani 2016) found that, in the state of Missouri, adoption of ethics codes varied between municipalities of various sizes. While the smallest municipalities (pop <1000) reported a just over 50% ethics code adoption rate, it was municipalities with a population between 1001 and 5000 that reported the highest adoption rate, at 70%. Municipalities with populations between 5001 and 10,000 reported a nearly two-thirds adoption rate. The largest municipalities in this study (10,000 < population < 100,000) reported a 62% adoption rate. The data disconfirmed a hypothesis that among these small- and medium-sized municipalities, larger municipalities are more likely to have adopted an ethics code. Anecdotal evidence suggests that contingent circumstances, like a history of public ethics scandal(s), swamp any correlation between ethics code adoption rates and population size below the pop. 100,000 level.

Ethics training, as opposed to ethics codes, is both more impactful and less widespread (Siewert and Udani 2016). It is also more difficult to pinpoint implementation rates because many different kinds of training (leadership, teamwork, etc.) might be either called ethics training, though it fails to address many basic concepts, or be implemented under some other moniker while addressing many of the basic ethical concepts. Working with specific definitions of "ethics training," several studies have sought to work past this problem. Beginning again at the federal level, the NGES (Harned et al. 2007) found that 96% of federal employees reported ethics training within their agency. There is no data available regarding the implementation of ethics training in public agencies at the state level.

Ethics training in US cities was the central focus of the West and Berman study (2004) of cities with a population of over 50,000. They begin with a very general definition of ethics training as "activities that increase participants' knowledge of the standards of conduct within an organization [and] deal with what is right and wrong, giving both guidelines and specific examples for identifying and addressing issues of ethical concern." On this definition almost two-thirds of respondents claimed to have had training that met the definition, although less than 37% said it was actually called ethics training. This training was mandatory for all managers in half of the responding cities. Feldheim and Wang (2004), again, surveying the same universe 2 years earlier, found that only 32% of respondents agreed that "we regularly conduct workshops in which ethics are discussed." This is a different question. Since it does not offer any kind of definition of ethics training and merely asks whether ethics was discussed in a workshop setting, one might expect a higher number than in the West and Berman study. However including the frequency modifier "regularly" changes the picture significantly. Feldheim and Wang found that ethics training was mandatory for all managers in only 28% of cities over 50,000.

At the smaller municipal level the Missouri Municipal Ethics Survey (Siewert and Udani 2016) asked respondents to report whether there was "no emphasis, little emphasis, some emphasis, or strong emphasis" on ethics training in their municipality. They found that municipalities of less than 1000 and municipalities of more than 10,000 provided "some emphasis" or "strong emphasis" approximately 20% and 15% of the time, respectively. However, for municipalities in the 1001–5000 and the 5001–10,000 categories, these responses only accounted for less than 10% of responses.

In summary then, while ethics codes and training are almost universal at the federal level and ethics codes are similarly widespread at the highest state levels, information on ethics training implementation at the state level is entirely lacking. At the local level, different implementation rates are found at different population levels

ranging between 30% and 70% for both codes and training.

## Content of Codes and Training

As was pointed out above, the specification of what kind of content a set of regulations or guidelines must have in order to be considered an ethics code, or what content a training regimen must have to constitute specifically ethics training, is still an open question. Some studies rely on respondent's intuitive definitions, while others provide a definition. These two methods have resulted in widely varying reported levels of implementation (West and Berman 2004). However, there are some general guidelines regarding content for both ethics codes and ethics training. There are two broad types of content. These have been termed "high road" or "aspirational" and "low road" or "compliance" models of ethics codes and training (Menzel 2007; Lewis 1991; Hejka-Ekins 1988; Lewis and Gilman 2005). Another approach is a focus on ethical decision-making in particular (Cooper 2012).

The most common model on which both ethics codes and ethics training are built is the "low road" or "compliance" model. This model is primarily focused on providing clarity on minimal legal and regulatory thresholds for ethical behavior (Lewis 1991). The compliance model is premised on the idea that at the very least, public servants should not violate laws and regulations when it comes to a variety of common areas of ethical difficulty including nepotism laws, open records laws, disclosure and campaign finance laws, conflict of interest statutes and regulations, etc.

The compliance model of ethical conduct explicitly delineates the legal and regulatory lines of any particular political agency in order to establish clarity on where the legal and regulatory limits to behavior are. As such, the compliance model sets a minimum with respect to ethical behavior. It establishes a basement level beyond which behavior in the public sphere may not fall. For example, compliance training might include information about how closely related a person must be in order for nepotism laws to apply. Is the local ordinance 3 or 4 degree of separation? Is there a clear local ordinance? Further specified will be the conditions under which a conflict of interest is defined to exist. Does a decision regarding the zoning laws of a business a public official has a 10% ownership share require that public official to recuse herself from the decision-making procedure? What if a public official's spouse has that share or perhaps the spouse has a 50% share? Where do local laws draw the line in terms of conflicts of interest? Other legal thresholds that a compliance focus in ethics codes and training seek to clarify include (but are not limited to) when a particular communication or document subject to the state and local open records laws and what the local requirements for campaign finance limits and/or reporting are.

As a result of its legal and regulatory focus, and the necessarily varying nature of such training given local laws and regulations, compliance content of ethics training is often done by lawyers, and compliance content in codes of ethics are often drafted by lawyers. Some research has shown a possible negative impact of such a compliance-only focus. By limiting the label of unethical to those behaviors that clearly violate laws and statutes, such an emphasis can lead to oversimplification of ethical values to the idea that anything that is not against the law is ethical (Menzel 2007). It might also spur an unproductive attention to trivial details (Rohr 1989).

While compliance training and codes are an important element of ethical behavior, it is important to remember that such content for ethics codes and training only sets a basement level below which a public official may not fall. The idea is that, all other things equal, any public official, whether elected appointed or employed, should not violate local laws and regulations. Compliance training and codes give examples of what not to do. On the other hand, the "high road" or "aspirational" model of ethics training and codes does the opposite. It sets ideal standards that an official is supposed to aspire to. It delineates the highest ethics goals, instead of the lowest ethically acceptable minimums.

Aspirational content for ethics training and ethics codes focuses not on specific limits to behavior but values and ideals toward which behavior should aspire. Such content attempts something like character education. It advances ideas like moral responsibility and moral autonomy (Hejka-Ekins 1988). An excellent example of an aspirational ethics code can be found in the "Seven Principles of Public Life" produced by the British Committee on Standards in Public Life in Great Britain. The seven aspirational goals focus on selflessness, integrity, objectivity, accountability, openness, honesty, and leadership (Lewis and Gilman 2005). Other contemporary examples include the American Society for Public Administration ethics code which includes focuses on integrity, excellence, and the public interest, as well as the International City Manager's Association (ICMA) code of ethics.

It is important to note that few codes are exclusively comprised of aspirational or compliance language. Usually there is a mixture, and the question is what the primary emphasis is. For example, the ICMA code first sets the aspirational goal that members are not "undermine public confidence in professional administrators" and then sets some specific compliance limits to the behavior of member city managers. It prohibits city managers from participating in "political activities to support the candidacy of individuals running for any city, county, special district, school, state, or federal offices. Specifically, they shall not endorse candidates, make financial contributions, sign or circulate petitions, or participate in fund-raising activities for individuals seeking or holding elected office."

Although there is no data on this, presumably the same is true of ethics training; it is usually comprised of content that is both compliance based and aspirational. It is certainly true that any set of codes and training modules that aims to be comprehensive in any sense must include both aspirational and compliance language. Public officials must know both what they are disallowed from doing and what kinds of behavior are seen as ideal (Lewis and Gilman 2005).

Finally, it is important to note that, especially with respect to ethics training, there are many dimensions along which such activities may vary aside from its content. Van Montfort et al. (2013) discuss a variety of ways in which the characteristics of the training program itself may vary. Training can be either mandatory or voluntary. It might be mandatory for some and voluntary for others. Who is doing the training can make a big difference, whether it is someone from inside the organization doing the training or someone from the outside. How open to discussion and examples from the participants is a training session? Are there follow-up meetings? What is the duration and intensity of the program? What is the size of the participant group? These variables themselves operate within a wider context of the organization itself. The characteristics of these organizational contexts may be conducive to productive discussions or they may not be. Further, each session, and the context in which it takes place, may be conditional upon the characteristics of the particular group of participants in the room.

## Impact

Ethics training and ethics codes are intended to create a better ethical environment. To what degree do they succeed? This question can be difficult to answer. The first problem is that there is a relatively little data available specifically linking ethics measures and ethical outcomes. A significant problem is the lack of broadly agreed upon definitions of the variables in question (Maesshalck and De Schrijver 2015). This article has already covered some of the issues with defining the independent variable of what exactly counts as an ethics code, and ethics training in particular is a slippery category. A much more significant problem comes to light when a definition of the dependent variable is sought. How exactly should the impact of ethics measures be evaluated?

At the top of the list of impacts should be the idea that ethics measures reduce the instances of unethical behavior. However, there are a very limited set of studies that attempt to measure such an impact. Perhaps the most comprehensive is the National Government Ethics Survey

administered by the Ethics Resource Center. The NGES makes very strong claims on behalf of not only ethics and compliance measures in particular but also a "strong ethical culture." A combination of these elements is claimed to reduce misconduct by 60% (Harned et al. 2007). However, these strong claims are suspect in light of several assumptions the NGES makes in its methods (Siewert and Udani 2016).

Overall, if the impact of ethics measures is to be assessed by measuring their effects in terms of reducing unethical behavior, the most difficult issue is the lack of any rigorous set of definitions, or any validated typology, of unethical behavior. What counts as an ethical infraction? Ethical infractions present in an almost limitless variety. They can be onetime actions by an individual. They might build up over time as a result of the non-coordinated actions of a group of people, or they might be anything in between these two possibilities. They can be intended as violations, or they can be unintended. They can be the result of malice or simply negligence. They can be merely accidental. The level of seriousness can vary from laughable to felonious. They can be tempered/exacerbated by context. Prima facie violations may be blameless all things considered. These complicated possibilities are particularly relevant in public institutions where the obligations engendered by positions held, and responsibilities created by the public trust, are superimposed on personal duties, obligations, and permissions (Siewert and Udani 2016).

Lasthuizen et al. (2011) have done significant work to attempt to address these concerns regarding the endless variety of ethical infractions. In addressing the overwhelming focus on corruption Lasthuizen et al. develop a validated typology of ethical infractions beyond outright corruption. This typology is meant to include all kinds of behavior normatively relevant to the organization both internally and externally. It captures behaviors in violation of both written and unwritten organizational norms, as well as violations of external laws and social norms. This typology is intended to avoid "oversimplification, over-generalization, and/or immediate condemnation" (Lasthuizen et al. 2011, 387) in the extant literature where generally infraction types are not distinguished in any rigorous manner.

Lasthuizen et al. developed a questionnaire with 64 categories of ethical infractions that drew on prior work by Hubert (1998) with police in the Netherlands. In each category the respondent was asked about the frequency with which they observed these infractions as well as their moral judgment with respect to such violations, thus measuring the moral opprobrium attached to each category of violation. They then used multiple step principal component factor analysis to derive ten families of infraction types that vary along frequency and moral judgment dimensions.

The Missouri Municipal Ethics Survey was the first survey of the impact of ethics measures to use this typology in order to correlate infraction rates with the implementation rates of ethics measures in those municipalities (Siewert and Udani 2016). This survey tested four hypotheses: whether infraction observation rates will be correlated to municipal size (partially confirmed for the categories of carelessness and manipulation of confidential information and the acceptance of improper gifts and favors), whether larger municipalities are more likely to have implemented ethics measures (disconfirmed), whether the implementation of ethics codes will have a negative correlation to observed infraction rates (disconfirmed), and whether the implementation of ethics training will have a negative correlation with observed infraction rates (partially confirmed for the categories of carelessness with confidential information and indecent treatment of colleagues, customers, or citizens).

One important outcome of this survey is that the impact of ethics training was most pronounced on those categories of violations that were most common. Carelessness and misuse of confidential information, as well as indecent treatment of others (along with the related category of hostile work environments), and the improper acceptance of gifts and favors were by far the most reported kinds of infractions. Therefore while the impact of ethics measure may be limited, they are impactful in the categories with the most frequent rates of violation. This should help to guide the content of such measures toward areas where their impact can be maximized, especially given the limited time and resources most agencies can devote to such activities.

Overall, while an ethics code is not sufficient in and of itself at the municipal level to impact infraction rates, the implementation of codes in municipalities is closely correlated with a higher likelihood of the implementation of ethics training in the same municipalities. Therefore, both together are important tools in addressing the rate of ethical infractions at the municipal level. No data correlating ethics codes and training with the rate of ethical infractions exists at the state or federal levels.

Aside from directly linking ethics measures with reduced ethics infraction rates, a wide variety of empirical studies of ethical states of affairs in the public sphere have focused on a plethora of factors. Siewert and Udani (2016) provide a partial list. Menzel (2007) surveyed of large metropolitan cities and counties regarding the implementation of ethics management programs. Bowman et al. (Bowman 1990; Bowman and Williams 1997; Bowman and Knox 2008) have studied ethical attitudes and environments nationally. Schmidt and Posner (1986) have studied public practitioner's values and expectations with regard to ethics. Feldheim and Wang (2004) seek the connection between ethical practices and levels of public trust. Berman et al. (1994) compare the public and private sphere on organizational ethical dimensions. Kaptein et al. (2005) and Giacalone et al. (2003) discuss the important subject of measuring and survey methodology with respect to ethical issues. Waring (2004) explores correlations between ethical climates and damage claims and complaints against the municipality as well as injury and sick leave. Finally Menzel (1993) examines correlations between an ethical climate and organizational performance. Whichever set of metrics may turn out to be the most important ones for evaluating the nature and impact of ethics measures, there is much work left to be done.

## Introduction: The Meanings and Measures of Compromise

Why does compromise in law, politics, and philosophy have such a bad name, when in family and relationship settings we are told that compromise is a good thing? Compromise is a concept with different and often conflicting definitions and value valences in different settings. For those in philosophy and politics, compromise connotes a "giving up" of pure principle and commitment to rights and truth, demonstrating weakness or lack of integrity (Benjamin 1990; Luban 1985). In contrast, in relationships we are told to compromise to consider the needs and interests of "the other." We "give up" something to someone else because we value something beyond the particular issue or dispute we are having about something, such as the relationship itself or an agreement, policy, or decision. The "ethics" of compromise requires a consideration of when it is "good" (right, correct, just, or fair) to compromise and when it might be "wrong" to compromise (Margalit 2010; Mnookin 2010). *Different contexts* clearly produce different assessments of the ethics of compromise.

Compromise as a concept assumes that one is "conceding" something to someone else, usually in order to achieve some goal – any agreement (e.g., contract, treaty, legislation, policy, or decision of more than one person), or simply to end a conflict or dispute – a "peace agreement," perhaps to preserve a relationship or to avert or end conflict. It has come to connote a relinquishment of something that is short of what one really believes in or values. *Principles* are philosophically "higher" and more valued than pragmatic decisions to forego something of value in order to agree to accomplish something else. Compromise is achieved when parties concede something to each other, either mutually and reciprocally or unilaterally or unequally. Compromises may or may not be symmetrical or equal in what is foregone, given up or traded, resulting in ethical concerns about power imbalances in the process that usually governs how compromises are made – through negotiation (Menkel-Meadow et al. 2013).

It is not a "compromise" when parties in conflict arrive at an agreement that meets their needs, either through a new or creative solution to their conflict or by a fairly agreed to negotiation and allocation of their interests (Menkel-Meadow 1984). Sometimes agreements are reached that are contingent, to be revisited when facts or conditions change, or when an agreed to process is used to resolve future conflicts. These situations also are not "compromises" strictly speaking, because parties may gain from engaging in the negotiation process and come to a new understanding of what their interests are, as well as recognizing the value of reaching a jointly achieved agreement, as contrasted with reaching no agreement at all by insisting on their claimed principles (usually an *impasse* when "true" principles conflict or the res being negotiated is scarce and cannot be shared or divided, Susskind and Cruikshank 1989).

Some political scientists (Gutmann and Thompson 2010, 2014), philosophers (Kuflik 1979; Golding 1979; Benjamin 1990; Margalit 2010), and negotiation theorists (Menkel-Meadow 2006, 2010, 2011) have argued that instead compromise should be valued as both intrinsically and pragmatically justified because it allows agreements to be made, actions to be taken, and decisions to be made, when not agreeing might be worse than making an agreement which is a compromise. Further, compromise may be morally valuable because it actually demonstrates respect for and recognition of other human beings' needs, interests, and humanity (Golding 1979; Cohen 2001). Successful politicians (practical people) have long lauded the use of compromise to get things done, from Machiavelli (1532, 1961) who suggested that leaders were required to compromise their own principles in order to govern the many, whose principles might differ from their own, to most recently, President Obama who has urged even dedicated social and legal reformers to "listen" and sit down with the other side, as Martin Luther King, Jr. did with President Lyndon Johnson, in order to produce the United States Civil Rights Act of 1964 (Obama 2016; Shapiro 2013).

For some, compromise is not possible or is unethical or immoral when the interests or conflicts among or between people are not equally *legitimate* (Margalit 2010; Benjamin 1990). Thus, efforts to "balance" or equate that which is incommensurable in order to reach agreements is not an ethical compromise. Compromises that result in great harm, cruelty, or inhumane consequences (consider Chamberlain's concessions to Hitler at Munich) are evaluated after the fact as being wrong, but may have been considered instrumentally expedient at the time they were made (Margalit 2010). Thus, evaluating the ethics of compromise contains a *temporally* complex element of assessment at the time of reaching the compromise or when its effects and consequences can be measured later.

Compromise includes both the *processes* by which agreements are reached, such as negotiation, mediation, and even arbitration and adjudication, as well as the *substantive agreement* itself. Consider King Solomon's story of potentially "splitting the baby" with two mothers claiming maternity – to split the baby in two would clearly harm the baby and be a terrible outcome, but King Solomon's process of announcing his intention to do so allowed the true mother to emerge (she who

would not allow her child to be split in two) – was this an arbitration or a very clever mediation? The threat of a commanded "compromise" verdict produced a life-saving "concession" and produced the "true" and just result.

Recently, and very unusually, the United States Supreme Court refused to decide an important and contested matter and returned a case to the lower courts for the parties to seek an "accommodation" of conflicting interests (religious employer insurance benefits of employee reproductive (contraception) health benefits under the American Affordable Health Care Act, *Zubik vs. Burwell* 2016). If the parties do not agree here (and elsewhere) it is also possible that a "compromise" ruling can occur by a *command decision* or a court or other decision-maker. Consider the parent who cuts a piece of cake in two and orders two children to share it (a classic "split the difference" solution of a dispute about a contested item, Brams 1996), or a court that allocates property, money, or personal rights in a shared, not binary, manner (as in divorce and joint child custody decisions). Thus, the ethics of compromise concerns itself with both *how we make agreements* with others and then, *what we actually agree to – processual*, as well as *substantive* ethical assessments.

This entry reviews the arguments made about when compromise is potentially ethically questionable, but also when compromise is ethically superior to no agreement at all.

## What Is Unethical About Compromise?

The classic ethical objection to compromise is that it is a foregoing of principle – that which is philosophically, politically, morally, or personally "right" and "true." We say that one should not compromise one's principles, those things we believe in, because it is those moral and political beliefs that are constitutive of who "we" (nation, organization, group, team, or person) are – how we define ourselves and our "reasoned" *integrity.* Thus, Chamberlain should not have conceded sovereignty of portions of Czechoslovakia (the "Sudentland") to Hitler in the hope of preventing war, Alexander Hamilton should not have offered to move the first US capital away from his home of New York, the Constitutional framers should never have allowed slavery to continue when drafting the first US Constitution (Levinson 2011) in order "to form and preserve the American union," and Republicans (in the US) should never agree to tax increases (believing as party principle that taxes should be low and government spending should be minimalist).

Under this conception of what is wrong with compromise, it is assumed that principles are "rational" (agreed to by any thinking person), morally correct, or strongly believed as a matter of self-constitution of a group or identity (values, beliefs or religious, political, moral, or emotional commitments). There are "right" and "good" conceptions of how to behave or think, and fault and "wrongness" should be assessed and condemned. In this view, there is a notion that the "good" is knowable, objective, rational, and essentially, at its core, universal. Consider the traditional conceptions of fault (wrong behavior resulting in liability) in tort law or breach of contract. The "fault lines," so to speak, are clear and must be policed to maintain order in a world, society, institution, organization, or family. Our integrity, worth, and values are what constitute us and we must be morally consistent to be true and right, both in our individual selves and in the polities, organizations, and societies in which we live. These ideas are based on *ideal* conceptions of what we should be as human beings and the groups that human beings create for their identities and self-governance.

Embedded in this conception of wrongful compromise is also a concept of "ownership" or *responsibility for agreement making*. Did Neville Chamberlain have the "authority" to concede sovereignty of a land that was not his? When agents (diplomats, legislators, lawyers) negotiate on behalf of a constituency or principal, by what legitimate authority may they compromise the rights or claims of others? (Menkel-Meadow and Wheeler 2004).

How we actually behave and assess ourselves, however, is often a different matter – thus compromise is both a *philosophical* (assessing

principled commitments) and a *sociological* (behavioral) concept, though many philosophers cling to the notion that a basic morality is or should be universal and not culturally variable, as in a Platonic or Rawlsian ideal of right-thinking, moral language, and ultimately, judgment of behavior (Mikhail 2011; Benjamin 1990).

Compromises are considered unethical on a *behavioral or process* basis when agreements are coerced, forced, or achieved through the exercise of unequal power – the "unconscionable" contract, the "victor's peace treaty" (e.g., Versailles after World War I). This, of course, assumes that in crafting agreements or decisions, the less powerful have alternatives to walk away or not make the agreement. Although it may be "unethical" or undesirable to agree to give up something under threat of force, there may be no choice in some settings, and it might be preferable to many to "live" with an "unethical compromise" than to die by principle, though we often venerate those who die for a principle, rather than compromise (e.g., Sir Thomas More refusing to swear an oath to the Church of England and Henry VIII).

Whether the more powerful party is content to live with a coerced agreement is another matter, which demonstrates that the assessment of the ethicality of a compromise or agreement is not necessarily symmetrical or universal. The assessments of the ethics of compromise, once again, are *variable, contextual*, and *not universal*, *but situational*. The ethics of compromise can be assessed from the perspectives of *all sides* to an agreement – the behavior of all parties in reaching the agreement or compromise, as well as the substantive agreement they reach, or by assessing what *each party does on its own part* to create, craft, or concede to the compromise (use of force, coercion, threat, empathy, fairness, or necessity).

## What Is Unethical About Not Compromising? Pragmatic Justifications for Compromise: To Get Something Done

It may, in fact, be unethical, immoral, or at least, ill advised not to compromise in many circumstances. As the political and practical theorist Edmund Burke (1775) has opined, most successful human interaction is the product of "compromise and barter" or the negotiated trading of interests. At the most pragmatic level, we would not have family relationships, legislations, governmental policies, any economic relations, or international treaties if we did not have a process of traded and bargained for exchanges, many of which involve one or both parties conceding something to each other for the greater benefit that the agreement or relation itself affords the parties.

In their recent plea for *more compromise* (and less polarized political principled based campaigning) in American politics, political scientists and philosophers Amy Gutmann and Dennis Thompson (2014) have argued that movement forward in political legislation and social policy is only achieved when parties of conflicting political values approach each other with *mutual respect, willingness to engage in mutual sacrifice, and a respect for the good faith values and intentions of their political opponents* (Gutmann and Thompson 2010). As relevant case studies many commentators have pointed to successful forms of legislation that were achieved by compromises of conventional political party commitments (such as the Tax Reform Act of 1986, the Civil Rights Act of 1964, and, to a much lesser extent, the Affordable Health Care Act of 2010) in which political parties "traded" such interests as deductions, tax rates, characterizations of legal liability, remedies, and choice versus mandates, with varying (and often inconsistent, less pure) subsidies and definitions of legal terms.

While attempting to provide different solutions for the public good, political legislation (derogatively called "sausage") often provides an array of incentives and disincentives for different public and private interests to participate in the greater good (e.g., generation of public revenues, health care insurance, and even the creation of new legal rights). Political legislation and public policy, with hotly contested differences of principles and ideas about how best to structure a society can only be accomplished by allowing some, if not all, contestants of principle to gain at least

some of what they want, both substantively and remedially. As President Obama recently said in a speech on listening and compromise it is better to get something and then try to improve on it in iterative negotiations, than to get nothing at all (speaking of his efforts in policing reform, as well as health care policy, Obama 2016).

## More Precise Justice

Despite the binary (and assumed to be "principled") nature of most legal actions, over the years many legal scholars have also argued that compromise or some form of less brittle (win-lose) result may actually effectuate a more "precise justice" (Coons 1963, 1980; Abramowicz 2001; Sunstein 1995; Menkel-Meadow 1984; Schatzki 1972). Legal standards and remedies of comparative negligence, *quantum meruit*, joint child custody, joint and several liability, creditor workouts in bankruptcy, and jury compromise and "mixed verdicts" are just a few examples of places where the law and legal process now recognize that "winner takes all" outcomes often do not reflect either factual or legal reality when there are equal rights on both sides (parental custody), mixed or indeterminate causation, or competing concerns between policy setting and justice (*general justice*) in individual cases (consider good faith purchasers for value who acquire title from a thief) (*specific justice*). Or, there are competing legal principles from which one might have to choose one over the other, where it might make more sense to find an accommodation between two or more equally important policy concerns, as in certainty and commitment of contracts, and impossibility of performance, equal distribution, or "equitable" or "redistributive" justice concerns. Adjudication or decisions for public policy may point in one direction, while conflict resolution for particular cases may point in another – some accommodation, compromise, or discretion to depart from rules may be necessary to effectuate justice in particular cases (Sinai and Alberstein 2015). And, we have empirical evidence that in order to reduce the risk of complete loss, "most [legal] cases settle." (Galanter and Cahill 1994).

When we have legal, policy, or scientific doubt it might make more sense to "split the epistemological difference" and craft agreements and solutions to problems that do not cut with too sharp a knife. As a form of compromise, mediated agreements now often are *contingent*, allowing revisiting agreement when conditions change or data and empirical study demonstrate consequences and actual effects of decisions made, often with the need to change commitments to accomplish particular ends (e.g., consider the use of "adaptive management" and tax subsidies, graduated incentives and penalties in some environmental disputes (Doremus et al. 2011), annuities in tort settlements, and transitional justice reforms that must take into account the past and the future, punishment and reconciliation, Menkel-Meadow 2015). Many legal problems, like bankruptcy, tort, and contract claims, now require more subtle "apportionment" of liability and redress than simple or principled "winner takes all" solutions.

Although legal policies are intended to govern for the many and contract and agreements only for those who are parties to a negotiated agreement, the tensions between what is "right" for the many (as a matter of *a priori* rule setting) and just or fair (in the actual moment of execution of duties and promises) for those in a particular situation often requires a more subtle use of discretion and flexibly crafted and enforcement of legal and governmental obligations. Thus, the ongoing tension in law between rule of law and equal treatment, with factual variation and discretion/judgment presents the need for the more tailored making and enforcement of law and rules that entails compromise as a more elastic form of human decision-making.

## Humanistic Justification

When parties are in conflict over the right and the good in general terms it is far easier to speak of unethical compromises (how can one

"compromise" on such values as "one should not kill"?) than the kinds of disputes that occur more readily in everyday life. Since even such basic principles as "thou shall not kill" have been "compromised" with justifiable exceptions, such as "except in self-defense," or when the other (fetus, animal) is not regarded as a rights-bearing entity, it is clear that more contestable principles or human needs may require some accommodation. Some moral theorists, political scientists, and negotiation scholars now have articulated an even more powerful justification for compromise – the recognition of the "other" (with whom we might differ on our conceptions of the good, Hampshire 2000) as a sentient, rights-bearing human being who should be listened to, respected, and from whom we might learn something and have our own views and, yes, principles, modified. Compromise then, may be ethically required, as a human value of empathy or recognition of the other, on both processual (listening, taking account of) and substantive (if you really care so much about that, then I will let you have some of it, if you will let me have some of what I need) grounds. Compromise has its own ethics of *reciprocity and fellow feeling*. This form of "compromise" suggests that where there are scarce resources we should learn to *share* them if we are all humans inhabiting the world of scarce resources with no clear, fair, just, or accurate way of allocating those resources, and when they are not scarce, we should engage each other in participatory and negotiated forms of consented to allocation. Compromise, as an ethical value in itself, promotes other good ethical concerns – sharing, consent, and fairness (a value sometimes in opposition to the more draconian "justice" ("just-us")).

## The Ethics of Compromise: Considerations and Issues

While many condemn the assumed "concessions" to principle made when agreements are made somewhere "in the middle," or when the weak are forced to give up to the powerful, or the minority to the majority (in conventional politics), this conception of compromise is thin and unrealistic. Agreements don't always require compromise (I like the icing, my brother likes the cake so we can cut the cake horizontally and both of us can have what we want, without the vertical, get only half, cut of a compromise solution to a conflict, Brams 1996). True communication and exploration of each party's needs and interests can explore complementary, not always conflicting, interests so that exchanges or trades or joint and creative activity can produce agreements where no one has to "give something up" in order to reach an agreement. Furthermore, in situations of repeat interactions (iterative "games" in game theory, repeat play in real politics, Baird et al. 1998) compromises may also alternate and use temporal agreements to produce multiple occasions for interaction, contingent improvement of agreements and outcomes, and opportunities for learning and revision.

Assessment of the ethics of compromise cannot be made as a universal or uniform value (*Compromis/Compromise* 2004). What is compromised (from what principles or endowments) is highly situational – depending, for example, on prewar, during war, or after war for diplomatic and political agreements, and the nature of the conflict itself (scarce resources vs. sharable resources) and the relationship of the parties to each other (personal, familial, economic, dependent, international, or one-off or ongoing). Where there is *doubt* (from a factual, legal, or moral basis) about what is "right" or "true," temporary, intermediate, or other nonfirm outcomes or agreements can resolve a dispute, allow more time for investigation, and allow the parties to proceed to action to collect data on performance and revise agreements later, as needed. Sometimes compromise is literally the *precise* or called for *just* or *fair* solution (e.g., shared custody of children, shared use of resources, allocations of scarce resources, alternating uses, multiple actions performed simultaneously, rather than one) allowing other values, like balancing of interests, resolution of ambiguity, humility, peace and contingency to trump

certainty, brittleness, and nonreviewability of outcomes.

Yes, there are "rotten compromises" (Margalit 2010) when agreements do great harm or injustice to people on one side of an agreement, and there are "devils" (Mnookin 2010) with whom we should not negotiate because we may not be able to trust them or verify their good faith in doing what they say they will do, but almost any human action, including so-called principled actions, court decisions, executive commands, or freely consented to contracts may turn out later to have consequences that were unintended, harmful to some of the parties, or, yes, just plain wrong. The unjust continuation of slavery in American history was facilitated by both constitutional compromises and political compromises ("the Missouri Compromise" in allocating free and slave states), but principled legal rulings (*Brown v. Board of Education* 1954) which proclaimed "right principles" did not fully facilitate the integration of the races in American education or civil life, and some have argued that a more fully honest and more incremental (compromising?) longer engagement over remedies might have led to greater acceptance and legitimacy of basic principles of equality (Seul 2004).

The search for some form of "compromise" or meeting of the minds of multiple parties to a conflict or dispute may itself be intrinsically valuable, as parties grant each other the respect of understanding and listening to what each values as they attempt to both settle differences between and among themselves, and craft new solutions to difficult social, legal, and even moral problems (e.g., abortion and right to life disputes, Podziba 2011). When our parents tell us to share and compromise with our siblings, they may be imparting an important message of human coexistence – learn to listen and work with your rival, for ultimately you may need to work with those with whom you have conflicts (both ideational and material) in order for both of you to live and prosper. We should learn to consider in the ethics of compromise not only when we *should not compromise* to preserve our integrity and basic principles but when we *should compromise* as a matter of human humility, fallibility, and the possibility that we may not be the only one who is morally, politically, or socially right.

# Ethics of Military Leadership, The

Rick Rubel
U.S. Naval Academy, Annapolis, MD, USA

## Synonyms

Character; Commissions; Disobedience; Dissent; Military orders; Moral courage; Moral; Oath of office; Respect; Trust

## The Ethics of Military Leadership

While leadership is a fundamental requirement for any organization to meet its mission, the military has to adopt a different, even unique form of leadership. This article will explain this uniqueness and why the military has adopted these unique principles, values, and virtues.

Unique mission – the military is the only profession that has to intentionally take human life. Other professions, such as surgeons and airline pilots, have people's lives in their hands. But the military is singularly required to "pull the trigger" and "push the button" that may intentionally take human life. The military also has to give orders to subordinates that may risk the lives of their troops. This tremendous but humbling responsibility needs to be taken with great care and a great sense of personal and institutional ethics.

## The Oath

This responsibility starts with a solemn oath. As people grow up, they incur their morals, values,

and obligations. However, the moment the oath is taken by a military officer, they immediately incur a new and distinct set of obligations. The oath taken as officers is as follows (Fig. 1):

There are two aspects involved with upholding the key promise to "... support and defend the constitution. . ..."

*Implicitly*, the officer is agreeing to adhere to the values, principles, and rights embodied in the constitution. However, from a constitutional view, citizens debate the Bill of Rights every day in the United States (freedoms of: religion, speech, gun control, abortion, etc). So when the oath is taken, are the military members all taking a slightly different oath to slightly different interpretations of the Bill of Rights? At the personal level, military members always have the right to disagree with each other on the interpretation of those amendments. However, as military members they are implicitly agreeing to follow the Supreme Court's most recent interpretation of the constitution, whether they agree with it or not. If they have a moral conflict with the Supreme Court interpretation and cannot resolve it within, they need to consider resigning from the military.

*Explicitly*, when the member agrees to "support and defend" they are agreeing to the constitutional structure of US government. In Article II, Section 2, the President is the Commander in Chief. That is very explicit. The military member is explicitly agreeing to *civilian control of the military* that they will report to the next duly elected President. They are also agreeing that they will fight whom they are directed to fight by the civilian control and not start their own wars (Constitution of United States of America, Article II, 1789).

Also, less explicitly, is the understanding by the oath-taker that there are some constitutional rights that he/she has to suspend while in the military. The military member has the freedom of speech, but not right now, as they cannot say certain things while in an official capacity. They don't always have the liberties of movement when military necessity is involved. The military member cannot politically campaign while in uniform or in their official capacity (The Hatch Act, 1939). In the current national defense policy, the military is a voluntary force. So it can be said that they consent to these suspensions of constitutional rights. During historical times of the draft, this suspension of personal rights was much more problematic.

## The Commission as an Officer

Beyond the oath to the constitution, there is also a formal obligation that ties each individual military officer to the President. This is a letter of commission, signed by the President for each officer in the service. The commission, generically says (Fig. 2):

Since each officer has a commission, signed by the President, their loyalty has to be to the office, not the person. This implies that they will not follow the general or admiral if there is sedition against the President. This is a point of civilian-military stability and clarity of loyalty.

The enlisted oath is a bit different, in that it says (Fig. 3):

This oath is more about obedience to superiors and the military legal system that governs disobedience.

***THE OATH***

***United States Code, Title 5, Section 3331, states:***
***"An individual ... in the uniformed services, shall take the following oath:***
***I (name), do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; that I take this obligation freely, without any mental reservation or purpose of evasion; and that I will well and faithfully discharge the duties of the office on which I am about to enter. So help me God.***

**Ethics of Military Leadership, The, Fig. 1** The oath of office

## Duty

In the military there are two types of duty: the military duty and the moral duty. Those two types of "duty" are only spelled the same way.

The military duty often follows from the external charge delivering the orders and missions. While these orders may give us latitude in execution, they are (externally) obligated to complete the mission. But the moral duty is more subtle. The (internal) moral duty implies that duty not only requires a nonoptional obligation, but there is recognition of fulfillment of duty with some personal sacrifice and without self-interest, profit, and benefit. The concept of selfless duty is a difficult identity for most who enter the military. The natural state of nature seems to be self-regard, self-preservation, and self-promotion. Becoming selfless requires training, education, and a great deal of conditioning.

## Orders

When given an order in the military, there are three options available to the military member. They can follow the order, dissent, or disobey. If an order is illegal, the order must be disobeyed, but obedience is implied in any legal order. Determination of the legality of an order is very difficult for a military member. The Manual for Courts-Martial of the United States says:

"As a fundamental premise, there is a presumption that a military order is lawful." The Manual for Courts-Martial states ". . . an order requiring the performance of a military duty or act may be inferred to be lawful and it is disobeyed at the peril of a subordinate. Any military person who willfully disobeys a lawful command of his superior commissioned officer.... shall be punished . . . if the offense is committed in time of war, by death or such other punishment as a court-martial may direct."

*COMMISSIONING CERTIFICATE*

*To all who shall see these presents, greetings: Know ye that, reposing special trust and confidence in the patriotism, valor, fidelity, and abilities of (the commissionee), I do appoint him or her an Ensign, United States Navy, or Second Lieutenant, United States Marine Corps, to rank as such from the 11th day of May, Two Thousand Two. This officer will therefore carefully and diligently discharge the duties of the office to which appointed by doing and performing all manner of things thereunto belonging.*

*And I do strictly charge and require those officers and other personnel of lesser rank to render such obedience as is due an officer of this grade and position. And, this officer is to observe and follow such orders and directions, from time to time, as may be given by the President of the United States of America or other superior officers, acting in accordance with laws of the United States of America.*

*This commission is to continue in force during the pleasure of the President of the United States of America, under the provisions of those public laws relating to officers of the Armed Forces of the United States and the component thereof in which the appointment is made.*

*Signed – By the President*

**Ethics of Military Leadership, The, Fig. 2** Certificate of commission, US Officer DD Form 1

**The Enlisted Oath**
**I do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; and that I will obey the orders of the President of the United States and the orders of the officers appointed over me, according to regulations and the Uniform Code of Military Justice. So help me God."**

**Ethics of Military Leadership, The, Fig. 3** The Enlisted Oath, United States Code, Title 5, Section 3331

A person's conscience, religion, or personal philosophy cannot justify or excuse the disobedience of an otherwise lawful order (Manual for Courts Martial, United States, 2012 Edition, Article 90).

Because military orders are inferred to be lawful, an "unlawful" order should be immediately recognizable. The articulated standard is that a military order must be obeyed unless it is "palpably illegal on its face," which means that a person "of ordinary sense and understanding would know it to be illegal" (Ibid).

The "lawfulness" of an order is a question of law. As such, "lawfulness" issues are decided not by the panel (jury) but by the military judge (Ibid).

If an order is determined to be legal but immoral or tactically flawed, the military member is encouraged to dissent – express nonagreement or opposition to a prevailing idea or policy.

Some communities of the military encourage dissent more than others. For example, the US Navy submariners (a nuclear powered vessel) encourage "forceful back-up." This is a non-optional requirement for anyone of junior rank to speak up when a given order that may cause a safety problem or compromise the mission (Basic Principles of the Naval reactors, US Navy Publication).

The final view of orders is, when faced with a situation, the officer must consider all dimensions of the problem. They must ask themselves what is right *tactically*; what is right *strategically, legally, ethically, mission completion, and people* considerations. The officer may get a different answer from each dimension. What is right tactically may not be right strategically. What is right legally may not be right morally. When an officer makes a decision, he/she will then give an order. In our military, it is expected the order to be followed by the subordinates. Therefore, the obligation to consider all possible dimensions, as well as the possible consequences of those orders, is paramount and often involves saving or taking human life. This is where military ethics comes into play. They must understand their own morals, their character, and they must embody the virtues of compassion, humility, and integrity to ensue the orders given are both legal and moral.

## Moral Considerations in the Military

There are several morally different ways to determine what is right and what order to give.

One moral test is the test of conscience: Can I live with my decision? That test may work much of the time as it brings into play the consequences of the decision beyond just accomplishing the mission. The problem is that in the military, decisions sometimes have to be made which may violate the moral conscience for the rest of their lives (e.g., dropping a nuclear weapon on Nagasaki). In the military, officers are often faced with "wrong versus wrong." In these very difficult situations the decision of which "evil" to chose may best be determined by the moral conscience test.

Other considerations for military decisions can involve strictly a consequential or utilitarian approach. In this decision process, one must consider all possible outcomes and select the alternative which provides for the greatest benefit for everyone involved. In the military, while the "greater good" must often be considered, importantly, this should not default to simple numbers. The degree, intensity, duration, and permanence of the decision needs to be considered. It should also be considered that allowing the "ends to justify the means" may allow a "slippery slope," which allows the decision-maker to justify absurd outcomes. Here, again, is where the moral conscience test may balance out the decision-making process (Moral Philosophy: A reader, 4th edition, 2009, Dr. Louis P. Pojman).

## Character: Trust and Respect

As military leaders, one's character must embody the virtues that gain the trust from subordinates. The military's enlisted are not likely to follow a leader they don't trust. Additionally, they will not put their own lives on the line to follow a leader they don't trust. And, as leaders, in order to develop the character of the subordinates, the leader will want them to emulate them. Without trust and respect they will not follow, die, or emulate their leader. The attainment of this

required level of trust and respect though is very difficult. Trust and respect is very hard to earn but very easy to lose. In the context of social contracts, it is almost unfair how hard it is to earn trust and respect and how easy it is to lose. However, this loss of trust is very simple to understand. It simply happens when the subordinate sees the character of the leader and that character is missing important virtues for trust (integrity, honesty, humility, compassion, loyalty, etc). When those virtues are missing, the follower tends to lose the fragile, yet essential trust in their leader.

## Character and Moral Courage

When it comes to making correct decisions and giving those orders that are expected to be followed, the relationship between our morals and our character becomes important. This is often difficult to understand since moral decisions are made all day, and people rarely think about this subtle relationship between our morals and our character. One way to look at this is that for someone to actually *perform the right action*, there are two components that must be fulfilled. The first one is that they need to have the moral reasoning and values to "*know* what is right." But the second component is that they have the character and those virtues to actually ***do*** the right thing. This is the critical point in the process when you have determined what is right but have trouble actually doing it. Most have experienced this point, and this could be considered the *point of moral courage*.

## Summary

The military has a unique mission that requires a different approach to leadership. It begins with the solemn oath of office and is codified by the officer's commission signed by the President of the United States. Military members have both an external and an internal obligation to fulfill their duty. When an order is given, the order is presumed to be legal and the assumption is the order will be followed. With the outcome of human life at stake, the officer must ensure the order that is given is both legal and moral. This requires that the military officer have a sound sense of moral reasoning as well the character that will lead to trust and respect.

# Ethics of Nonprofits

Robert W. Smith[1] and Palina Prysmakova[2]

[1]University of Illinois Springfield, Springfield, GA, USA

[2]Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Code of conduct; Moral code; Morality standards

## Definition

A set of moral and professional principles that govern nonprofit organizations.

## Introduction

Ethics in the nonprofit sector has often been discussed in the light of their relationships with the constituencies they serve. Because they often work with at-risk populations, there is always a potential for abuse, fraud, or waste, and there is a requirement that the nonprofit has a serious foundation of ethics (Koziol 1998). With this regard, many nonprofits are guided by the ethical standards of their respective professions and what to do or not to do while providing the service (Brudney and Martinez 2010).

At the same time, nonprofit leaders also follow the norms of conduct established in the nonprofit world. For example, nonprofit boards of directors depend on volunteers, contrary to their business counterparts. Nonprofit board members often donate labor, fiscal, legal, and perform other tasks that aim to achieve broader societal goals (Brudney and Martinez 2010). Moreover, nonprofit board members are required to honor their ethical obligations above any obligations to their employers or other outside interests (Rosen 2005).

This contribution will highlight some key differences between nonprofit organizations and their public and private business counterparts through the lens of ethics. This entry will also identify some internal and external solutions to address frequently occurring ethical dilemmas. Adopting a code of conduct and participating in professional networks and organizations represent some first-order approaches. Despite these ethical frameworks, many nonprofit organizations often fail to keep the highest ethical standards throughout their operations. Often questions about ethics behavior and processes get neglected and overlooked. This narrative discusses several theoretical perspectives about the role of ethics in the nonprofit world. While most of the examples presented here are centered in the United States, the authors have observed firsthand the ethical dilemmas confronting nonprofit sector operations across the globe, and, unfortunately, these ethics lapses remain rather universal. At the same time, this universal dilemma of ethics across nonprofit organizations persists regardless of the main actors and stakeholders demanding, establishing, and promoting ethical codes of conduct across a variety of organizational types, whether they are public, private, or nonprofit.

## Differences with Other Sectors of Economy

Because nonprofits typically differ from private for-profit business, nonprofits present a unique setting for studying and practicing ethics. Although it must be acknowledged that many nonprofits themselves may be profit-oriented or enterprise-oriented (e.g., private schools and universities or entities as functionaries of large corporations), their focus under most incorporation laws is distinct from a profit orientation, whereas business entities exist primarily to earn profits for its shareholders. In contrast, a nonprofit organization seeks to provide needed services and/or support (when we talk about membership-based organizations). This difference in values basis explains why management that motivates employees in for-profit firms is often not available or is irrelevant in the nonprofit sector. Nonprofits are inherently value-laden and created to provide services not forthcoming from either the public or private sectors.

Ethics are crucial for understanding the mission and function of a nonprofit organization (Berman and West 1998). Moreover, norms of accountability separate nonprofit organizations from the private sector organizations. Businesses are accountable to shareholders (and customers), and their successes or failures can be measured in the company's balance sheet. Evaluating the success of the nonprofit sector is problematic in the presence of a bottom line. Nonprofit managers are responsible to be good stewards of organizational finances while guaranteeing that all the operations

fulfill the mission of the organization. In other words, nonprofit organizations are motivated to meet their financial goals but in tune with their organizational values (Brudney and Martinez 2010). However, this becomes an elusive standard by which to measure "ethics."

The public often assumes nonprofits are held to higher ethical standards than either government or business. Evidence suggests this seems to be tied to the more altruistic environment associated with nonprofit causes and the higher ethical expectations surrounding the purpose or mission of the nonprofit. More than 25% report high confidence in charitable organizations when compared to government (nine percent) or major corporations (seven percent) (O'Neill 2009). Yet there are concerns about the ethics imperative under which many nonprofits operate. Ethical responsibilities extend to checks and balances in financial management, reporting, and governance issues. At the same time, nonprofits are also committed to value propositions, and operationalizing them is often challenging.

The United States-based Ethics Resource Center has a comprehensive data set on ethics in nonprofit organizations. For example, in 2008, some 58% of employees reported a strong ethics culture compared to only 52% for business and 50% in government. Yet, more than half of employees in nonprofits observed misconduct in the previous year and identified risks from conflict of interest, lying, misreporting, and abusive behavior. Unethical conduct and behaviors in other parts of the world are equally evident in that lack of transparency creates even more opportunities for misbehavior and organizational abuse (https://www.transparency.org/en/).

## Internal Solutions to Existing Problems

Having an ethics program in place is key to prevent and to respond to unethical practices. In US nonprofits without an ethics program, 68% observed misconduct while it was measured at only 22% in organizations that had an ethics program in place (National Nonprofit Ethics Survey 2008). Moreover, 60% of nonprofit employees who observed misconduct reported it. Those who chose not to report cited concerns about fear of retaliation or that reporting the misconduct wouldn't make any difference. Although firing, demotion, and reassignment are illegal forms of retaliation, many nonprofit personnel simply acquiesce and do not get involved. Therefore, even in nonprofits that may have a strong ethical culture, it may still not result in consistent ethical behavior throughout nonprofit organizations.

The corollary to ethics in nonprofits is accountability. Being answerable to external entities implies a sense of obligation to stakeholders within and outside the organization (Farazmand 2002). And as warranted, performance standards and corrective action need to be part of the administrative repertoire of nonprofits. Input from stakeholders is crucial in this regard. For example, in the United States, more than 70% of nonprofit board members believed they were accountable only to their own board (Millisen 2005). Because in many developed countries, nonprofits operate under tax exempt status as granted by government and publicly elected representatives as they perform socially desired activities, there is accountability to the public and citizenry to be considered. Hence the public is a major stakeholder in the activities and services provided by nonprofits. From this fiduciary viewpoint, the responsible nonprofit should, therefore, strive to remain bound to their missions, resolve that outcomes matter, and insist upon transparency (Bowman 2012).

Institutionalizing an ethical culture is the crucial foundation, and internalizing ethics through the development of an ethical culture is crucial to ensure the integrity of the nonprofit. Nonprofits that have a strong ethical culture where executives lead with integrity, top management stresses ethical conduct, coworkers exhibit a commitment to ethics, and the organization uses ethics in day-to-day decision-making have a strong ethical culture (Rhode and Packel 2009). Nonprofits that adopt these practices report less misconduct and pressure to compromise on ethics and are less likely to face negative reactions for whistleblowing and reporting of the wrongdoings.

## External Professional Support

Professional organizations play an important role in setting and maintaining ethical standards for nonprofits. For example, in the United States, the National Council of Nonprofits is a network of state associations and 25,000-plus members which serve as a central coordinator and mobilizer to help nonprofits in local communities across the country. They promulgate recognized ethical standards and accountability practices and catalog-specific legal obligations which vary state by state, share resources on state-specific legal requirements, and promote "best practices" on ethics, accountability, and transparency for nonprofits in practice. The Council promotes accountability and transparency; prudent fiduciary oversight; legal, ethical, and responsible fundraising; and effective governance as reinforced through sound practices for every charitable nonprofit. It encourages nonprofit organizations to adopt such practices to show that they deserve the public's trust and that they are serious about advancing their mission and at striving towards excellence. In the United States, there are no less than 31 states that have issued guidelines for ethical practices in their respective states. The association espouses transparency in nonprofit operations, communications that are honest and open and accurate, financial transparency, accountability to donors, adherence to all state and federal regulations, and provision of timely reports (National Council of Nonprofits 2021).

Equally, *Independent Sector*, a coalition of charities and foundations, has issued an official model code of ethics for nonprofit groups. It reflects a comprehensive effort to deal with ethical controversies in the nonprofit sector. The code stresses the law is only a minimum standard of ethical behavior, and nonprofits need to go well beyond such a minimal legal requirement. The code emphasizes the importance of ethical behavior for nonprofit groups. The code suggests nonprofit groups enact their own ethics standards, including policies on the appearance of a conflict of interest between the organization and its managers or board members and promoting full disclosure. Other parts of the code address financial guidelines such as spending a "reasonable percentage" of their annual budgets on the program mission and compensation of staff and providing comprehensive and timely financial information to the public (Lipman 2004). They also must ensure donor assurances that their contributions will be used as intended. Their guidance notes that if the organization doesn't have a culture of ethical practice, codes have little meaning. Ethical topics of the *Independent Sector* include board compensation and loans to executives. In addition, *Independent Sector* focuses on concerns raised about donations of products and services, such as real estate, and examines ways charities can more accurately assess what the gifts are worth.

## Implementation Challenges

Ethical challenges arise at all levels in all types of organizations. Rhode and Packel (2009) offer some definitive advice and observations on the role of ethics in nonprofit organizations. Some challenges involve criminal violations, fraud, misrepresentation, or misappropriation of assets. Many more ethical problems comprise gray areas that border on outright fraud or involve conflicts of interest, misallocation of resources, or lack of accountability and transparency (Rhode and Packel 2009). Indeed, the capacity for ethical judgment (and clarity on moral issues) differs widely among individuals (Farazmand 2002). He observes that character over performance is a key element and ethics flows from internalizing a culture of ethics through institutionalization and acculturation. In the absence of this backdrop, leaders may have a high degree of confidence in their own judgment, but such viewpoints may lead to decisions that are wrong or lacking in ethical sensitivity if a culture of ethics is not reinforced in the organization. Many times, to cover up their mistakes, nonprofit leaders deny, withhold, or even destroy related information (Krawiec 2000).

Cognitive dissonance is equally an issue and leads to suppressing information that casts doubt on a prior belief or action. In this case, the leaders may discount the value of the harm that was

caused by their own conduct (Rhode and Packel 2009). Group think can also result in unconscious actions that lead to downplaying of counter viewpoints. Encouragement of team loyalty hence replaces frank and open decision-making (Rhode and Packel 2009).

Ethics is also affected by organizational structures or norms. Organizational reward systems can lead to a focus on short-term gains, growth, or donations at the expense of values. On the one hand, inadequate compensation and bonus systems often become the center of unethical problems. Salaries, often lacking by private sector standards, can still cause dissonance in the nonprofit organization, particularly when the nonprofit is struggling to deliver basic services. It is also the perks that nonprofit leadership may receive may create discord. Nonprofits must also be concerned about benefits for staff and volunteers. Sometimes minor expenditures can pose significant problems in public perception. For that, nonprofit organizations should have clear policies about employee reimbursement and require only cost-effective expenses (Rhode and Packel 2009). On the other hand, in nonprofits, organizational members may feel pressure to minimize administrative expenses to the fault of engaging in misleading conduct (Rhode and Packel 2009), so that these organizations look more favorable in the eyes of the donors or external stakeholders.

Situational pressures can also undermine ethics. For example, when jobs are on the line, individual moral directives go astray (Farazmand 2002). Organizational behavior equally highlights that individuals are more likely to indulge in unethical behavior when acting with others. When bending or ignoring the rules benefits a group, members of the group feel pressure to put their ethical reservations on the back burner. When organizations place heavy emphasis on loyalty or other important rewards to support "team players," the pressures to behave unethically increase. If a nonprofit employee inflates expense reports or pilfers office supplies or donations, other employees may look the other way for fear of breaching loyalty to the organization (Rhode and Packel 2009). Once employees yield to such pressures when the ethical implications seem insignificant, they can start on the slippery slope where they engage in more serious ethical misconduct.

Ethical roadblocks occur when organizational members are not accountable for actions of the group. For a nonprofit board of directors, individual reputations rarely suffer, and they are typically insulated from personal liability irrespective of their decisions. Other dimensions of nonprofit organizations can also contribute to unethical conduct. For instance, when larger organizations face ethical challenges, they may try to compartmentalize the information across multiple departments and employees (Rhode and Packel 2009). In large organizations, in many ethical challenges, nonprofit professionals and leadership often lack important facts which may raise ethical as well as legal concerns. Such fragmentation of decision-making prevents professionals from seeing the full picture, therefore missing the ethical consequences of nonprofit actions.

Conflicts of interest often arise in the nonprofit sector. Conflicts of interest occur when a nonprofit offers some form of preferential treatment. As many as every fifth nonprofit in the United States report that they buy or rent goods or services or buy or lease the property from a member of the board of their directors or her affiliated company. Most of them, however, do not report such activities or transactions, and the board members do not disclose publicly their conflict of interest (Rhode and Packel 2009).

Despite the ethical quandaries that these situations create, many nonprofits often hesitate to impose restrictions because of preferential treatment accruing from these relationships. Establishing the clear policies about conflict of interest would demand transparency about potential conflicts and the process by which they are handled (Rhode and Packel 2009). Similar concerns about ethics include accuracy in nonprofit reporting and urging nonprofits to pay particular attention to transparency.

In regard to financial information, nonprofit organizations often face ethical situations when deciding on accepting donations that have any appearance problems or preconditions.

Appearance of impropriety matters and it makes sense to avoid affiliations where a donor is reflecting problematic conduct or seeks to impose restrictions on the use of funds. Socially responsible investing requires that nonprofits should ensure consistency with their values. Specifically, investing in opportunities that further the nonprofit's mission should be pursued, while disinvestment from ventures that undercut its mission should be suspended. Consistency between financial management and program objectives or mission is a key.

While promoting ethical decision-making within organizations is important, no set of rules or strict and clear compliance protocols can guarantee the ethical behavior of their employees and volunteers. The effectiveness of codes depends on how standards are developed, perceived, and integrated into the workplace. Codes that are too vague, inflexible, or narrow do not bring many results.

## Theoretical Perspective

It is important to reflect briefly on a set of theoretical constructs that guide ethics decision-making and ethics in organizations (including nonprofits). But this departure point is not meant to be exhaustive nor inclusive of all relevant theories that should be considered for understanding ethics in nonprofit organizations. Concepts of *Utilitarianism* with a grounding in "the most good, for the most people"; *Virtue Ethics* and a focus on personal character; the *Ethics of Care Approach* as derived from feminist literature; *Communitarianism* as interpreted as what's good for the community; and *Pluralism* (often situation dependent) are all appropriate departure points to consider as a basis or framework for approaching ethics in nonprofit organizations. More general philosophical threads such as *teleology* "the ends justify the means" or *deontology* are instructive in terms of denoting the notions and role of "duty and obligation" (Grobman 2018).

A useful theoretical underpinning linked to the imperative of ethical culture is advanced by Strickland and Vaughan (2008) who offer a framework of self-actualized organizational culture for nonprofit organizations. They argue that following the law does not mean that an organization is ethical. Moreover, external controls can only do so much toward developing an ethical culture. Many nonprofits face ethical dilemmas even without violating legal precepts. For example, sexual misconduct by staff, excessive compensation packages for executives, and questionable fundraising practices erode the perception of the nonprofit sector by the general public, even if some of these practices stay within the legally allowed societal norms (Strickland and Vaughan 2008).

Nonprofit organizations, like individuals, usually do not start out exhibiting the highest levels of ethical behavior. Just like other organizations, nonprofits evolve, from formation through growth to maturity. Similarly, there are different external controls that motivate nonprofits to adhere to the ethical standards that are more important during a particular stage as compared to another. For example, external controls like laws, rules, and regulations play especially important role on early stages of the nonprofit development. As organization develops and establish itself as a valuable community actor, respect and integrity are achieved through an internalized ethical culture that often occurs in later stages of organizational growth (Strickland and Vaughan 2008).

Some scholars suggest that we can use concepts related to moral reasoning to better understand what drives the ethical behavior of nonprofit organizations at certain stages of the life cycle of nonprofits. This is especially key given the dramatic growth in the nonprofit sector and the increasing attention paid to ethical conduct given recent scandals across all sectors – nonprofit, private, and public. From this perspective, the costs of engaging in unethical behaviors often outweigh the benefits. Meanwhile, maintaining such ethical values as financial competency, accountability, and respect allows nonprofit leaders to achieve the long-term success of their organizations.

These theoretical lenses are useful for thinking about ethics in nonprofit organizations beyond the deontological (principle) and teleological (ends justify means) continuum often invoked in examining ethics in organizations. The notion of ethics and an ethical environment growing within the organization life cycle is an informative description of how ethics may evolve in nonprofits;

however, it equally may not address why established nonprofits still struggle with ethics transgressions despite reaching certain levels of maturity as an organization. There may be other reasons for stunted ethical growth and hence the need to balance theoretical underpinnings of ethics with practical concerns for the development of an ethical culture in nonprofit organizations.

While this discussion is mostly devoted to the questions of ethics dilemmas and controls within the nonprofit entity itself, it is the nonprofit sector overall that often plays a crucial role in developing, promoting, and controlling the execution of ethical norms and standards for not only nonprofit organizations but public and private organizations also. Nonprofit organizations are often in the best position to embrace the **demand-side approach to ethics** reforms precisely because of their ability to create a cross-sector dialogue on the imperative of ethics, for example, with government because of the overlap of services provided by both organizations. What is an ethical concern for a nonprofit is hence an ethical concern for a government entity collaborating with that nonprofit. At the same time, nonprofit organizations are also involved in the **supply of ethics approach to ethics** (e.g., ethics training and education). After conducting several cross-country comparative observations, Prysmakova and Smith (2016) proposed a framework that depicts how ethics improvements are promoted and controlled by the nonprofit sector on a supply-demand continuum. The proposed framework holds great utility as both a descriptive and an evaluative means to compare ethics reforms across the globe and the role of the nonprofit organizations in their successful implementation.

## Conclusion

This discussion on nonprofit ethics introduces readers to the main differences of the nonprofit sector from its public and private for-profit counterparts. The brief summary highlights differences in both expectations and implementation of ethical conduct at the organizational and individual level. It further offered some internal organizational solutions as well as demonstrated how external actors, namely, professional organizations, can help the nonprofit to maintain the highest possible levels of ethical conduct. While most of these observations sound straightforward and reasonable, many organizations face challenges while implementing them. The most significant contribution of this essay is to identify the reasons why unethical behavior still takes place in many nonprofit organizations. The entry closes with a few theoretical perspectives on why creating and maintaining the highest possible level of ethics in a nonprofit organization is important and difficult. Moreover, ethical consequences, positive or negative, are often the result of conscious decisions made by nonprofit leaders themselves.

# Ethics of Resiliency in Crisis Management

Haris Alibašić
Public Administration Program, College of Education and Professional Studies, University of West Florida, Pensacola, FL, USA

## Synonyms

Accountability; Climate Change; Ethics; Leadership; Preparedness; Resilience

## Definition

Resilience is the capacity and ability of organizational systems to recover from shocks and disasters and to continue to thrive during and after disasters. Ethics of resiliency is the defined responsibilities of public administrators to ensure the maximum resilience of all the parts of the interdependent systems within an organization to prepare for and recover from crises.

## Introduction: Resilience and Adaptability

Various aspects of climate preparedness, disaster planning and recovery, and hazard mitigation are researched and studied at length, focusing on the administrative role in resilience planning, adaptation, and disaster mitigation and crisis management (Wamsler 2014; Alibašić 2014). The resiliency to crisis and disaster is the capacity and adaptability of systems not only to withstand stresses and shocks but also to continue to thrive during and after the disaster. System change is the ability of organizational leadership to organize all modes of the operations to operate separately and efficiently in case of disasters and if a part or parts of the system fail. Moreover, Fiksel's (2003) emphasized the "understanding of system resilience in light of 'significant disruptions or discontinuities' shifting "the system away from its current equilibrium state" (p. 5333). In addition to adaptability to societal and environmental threats, the ability of organizational leadership to acclimate an organization to disruptions, adaptability to societal and environmental threats is an essential function in resilient systems.

Resilience planning must be done in concert with the active policy making and development of succinct measures for a changing paradigm within an organization. In crisis, organizational efforts coalesce around the need to continue providing services, to protect lives, property, and infrastructure, and to minimize damage. The system approach to preparing for crisis and managing disasters is critical to longevity and resilience of communities and organizations. Wamsler (2014) offered a comprehensive review of vulnerabilities and the type of disasters cities are facing, and their abilities to manage disasters, sustain, and adapt to changes. In cities, an ongoing transitions, transformation, and changes occur daily. City

administrators and elected officials must be able to adapt to the forecasts and trends and be prepared for the new threats and challenges their communities are facing.

## Ethics of Resilience, Preparedness, and Crisis Management

From a comparative perspective, much has been written about resilience. However, very few studies have been conducted focusing on the interactions between ethics and resilience. More broadly, there is no nascent research reviewing the ethical considerations in implementing resiliency measures to prepare and strengthen systems within organizations and communities to withstand shocks. Osorio (2017) in reviewing the interrelation between the science and ethics constructs "the ecological notion of resilience as a moral boundary," as an approach to separating the right from wrong. Defining resilience in the context of moral boundary shapes the new norms relative to an administrative role in responding to all types of disasters. Using novel approaches and strategies aimed at addressing community stressors allows organizations to recover from shocks.

The fourteenth-century scholar Ibn Khaldun (1406, Ibn Khaldun 1969) pointed out the necessary "requirements, for the planning of towns and the consequences of neglecting those requirements," including the importance of the air, water, and land quality (p. 267). While modern cities have different requirements and concerns, in essence, Ibn Khaldun pointed out to the necessity to properly plan towns. Inability or incompetences to take into consideration the sum of elements of planning would lead to failure, in this case, of towns and cities. As such, moral and ethical obligations of the administrators is to consider all the elements necessary for planning the communities in such manner they can survive and continue to thrive under adverse circumstances, including natural hazards. Modern cities face a myriad of threats, stemming from natural hazards and further exacerbated by global warming trends, including heat waves, floods, and storm damage, among many other hazards.

## Natural Hazards and Climate Change

The risks from environmental hazards are exponentially higher in urban areas, with the higher concentration of population especially in the US cities, where over 62% of the population lives on only "3.5% of the entire land area" of the country (Census Bureau 2015). The threats are further exacerbated by the changing climate resulting in extreme and unpredictable weather patterns. Furthermore, Jacob and Winner (2009) in their study posited the direct negative correlation between the effect of climate change and the air quality, negatively impacting urban areas. Anticipated increases in the frequency, occurrence, and duration of the extreme weather event such as heat waves, and floods will disproportionately adversely affect the most vulnerable population in cities. In some cities, residents are encouraged to lower emissions during prolonged heat events to improve air quality.

While the risks of climate change increase the frequency and unpredictability of extreme weather events, the natural hazards continue to challenge human and other resources in cities. Climate change will further exacerbate the extreme weather-related disasters and cause further disruptions and damage. Therefore, a more rapid deployment of resilience-related measures to address public safety and public health dynamic in emergency preparedness and disaster recovery need to be considered. The former President Obama' s Climate Preparedness and Resilience Task Force recommendations focused on many aspects of community resilience, including initiatives to increase capacity for public safety, climate readiness, disaster mitigation, emergency prepardness, and public health. The recommendations from the Task Force include the stern warning about the nature and risks of climate change, as "a significant public health threat to individuals and communities, exacerbating illness and increasing the frequency and severity of dangerous extreme weather events" (Task Force 2014, p. 9). Communities are on the front lines of extreme weather events, and they must plan for the foreseen and unforeseen events, without the reliance on state and federal funds and resources.

## World Trends in Risk Mitigation and Disaster Recovery

There are notable global trends in adoption of resilience-driven planning and strategies. In its review of the United Nation's Agenda 2030 for sustainable development goals, the United Nations Office for Risk Reduction (UNORR) (2015) identified the direct linkages to disaster risk reduction and resilience approach to sustainable development. The end goals of the Agenda 2030 include the poverty reduction, ending hunger, ensuring healthy lives, promoting inclusive and equitable education and sustainable economic growth, providing sustainable water, sanitation energy among other objectives (UNGA 2015). The UN's agenda for sustainable development takes into consideration the current dynamic and new realities that collectively the world is facing. As noted in the World Bank's's (2012) Sendai Report "by quantifying risks and anticipating the potential negative impacts of natural hazards on society and the economy, disaster and climate risk assessments can help governments, communities, and individuals make informed decisions to manage risk" (p. 17). Furthermore, the World Bank (2012) posited the resilient societies prepare for and incorporate the disaster risk management into active organizational strategies. Preparing for a disaster and effectively responding to them are essential components of resilient communities, organizations, and the society. With the increased risks of climate change, emergency preparedness and resilience planning are imperative to a comprehensive protection of community resources.

## Emergency Preparedness and Disaster Mitigation

As cities face the new threats, they change the way their first responders, public health, and safety officials operate. Los Angeles continues to experience unprecedented heat waves, including the recent onslaught of temperatures more than 98 °F (Castillo 2017). Heat waves lead to increases in emergency room visits and premature deaths. The increased frequency and ferocity of the extreme heat wave events prompted extensive changes to city planning and emergency preparedness in several cities from Chicago, IL, Los Angeles, CA, to Grand Rapids, MI, to name a few. By proactively planning and taking into consideration unpredictable nature of disasters, communities can respond and recover from the events. By adopting preventative measures, damage mitigation, recovery, and crisis are managed more efficiently.

Recent onslaught of hurricanes descending down on Florida, Louisiana, Texas, and other states with destructive intensity and hyperactive frequency renewed the nation's interest in community resilience, disaster recovery, risk management, and emergency preparedness. Far-reaching impacts of climate change and extreme weather impacts possess the economic, environmental, and social characteristics. Under social consequences, in the posthurricane disaster assessment and analysis, communities are faced with significant health effects on the most vulnerable population. As noted in the Bureau of Epidemiology (2015) report, the State of Florida is the most prone to the deadliest of hurricanes, and the health effects of hurricanes and other extreme weather events are significant. Inability to adequately prepare and to take into considerations all the elements of resilience planning will lead to failure with the disastrous aftermaths. The recent case to adequately respond to crisis and deaths in a nursing home in Hollywood, Florida, in the aftermath of Hurricane Irma brings such failures with tragic consequences into spotlight (Nedelman 2017).

## Resilience Planning and Resilience in Practice

Federal, state, and local governments throughout the United States realize that resilience planning is an essential tool for sustaining communities and preventing and reducing losses following natural and human-made disasters. The need to manage environmental and development issues in communities while balancing them with the safety, security, and public health is the key to local success in fostering resilience. In a sharp reversal

to the past government policies and practices, most local and state governments are more deliberate in reviewing the impact of developments in hazardous areas. The measures to reduce the impact from and prepare for potential disasters include sustainable transportation and planning with mixed-land use, flood control works, discouraging development in flood zones, near wetlands, coastal areas, and established areas of inundation, and the use of other practices that have improved resilience and decreased exposure and loss (vulnerability). Additionally, resilient cities conduct infrastructure studies with cost-benefit analysis of designs based on traffic impact on runoff and urban storm water discharges, and vulnerability impact analysis.

Furthermore, some organizations began to incorporate the assessment and to quantify the multiple environmental, social, and economic benefits of green infrastructure, as trees, forests, wetlands, and waterways provide natural protection and increase resilience by improving air quality, providing shade, reducing heat, storing surface water, and filtering stormwater runoff. Other efforts include innovative approaches to critical climate infrastructure such as low-impact development and green infrastructure, implementing the paradigm shift in stormwater management best practices. In some cases, conservation and expansion of green infrastructure decisions include measurements of meeting the Greenhouse Gas mitigation targets, public health, and safety goals, and climate change adaptation priorities. Finally, it is vitally important for public service organizations to coordinate their resilience planning efforts with power utilities to ensure timely response to power outages occurring during and after severe weather events.

## Conclusion

There is no available empirical research and analysis relative to the consideration of ethics of resiliency in crisis management. A significant body of research and writing offer an insight into the nascent field of resiliency. A potential correlation from resilience to ethics focuses on the resiliency of systems and the role of administrators in emergency preparedness and disaster mitigation. In combination with emergency preparedness, resilience planning takes into consideration approaches used for zoning, land use, engineering design, infrastructure planning, food, health, and safety, and incorporates them into a single plan. Municipalities and other levels of government within their organizational and leadership capacity have a vested interest in continuous improvement and adoption of strategies taking into consideration various stressors to better prepare for disasters. Finally, as an ethical obligation and moral imperative, it is in the interest of the community leadership, elected and appointed officials to actively pursue resilience planning in their respective organizations. Failure to pursue resilience could have far-reaching adverse consequences on organizations and communities in case of disaster and crisis.

# Ethics of Sustainability

Christopher R. Whynacht
College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Environmental ethics; Ethics of sustainable development

## Introduction

One of the greatest ethical debates of the twenty-first century focuses on the issue of sustainability. An ever-growing body of academic research and anecdotal evidence has accumulated around the negative impacts which the collective human enterprise has on the natural environment that supports societies large and small (Rockstrom et al. 2009; IPCC 2014; White et al. 2016). Examples of environmental degradation stemming from human activities are far too numerous to fully list, but several notable examples include chemical pollution, the destruction of natural habitats, and climate change. However, sustainability is much more than a euphemism for environmental responsibility; at its core, sustainability balances environmental, social, and economic dimensions. From a human welfare perspective, it is clear that increasing levels of socioeconomic inequality, the lack of quality education programs, and poor access to healthcare are as equally unsustainable as environmental degradation (United Nations General Assembly 2015). Economically, environmental governance initiatives and social programs need financial support; thus a sustainable human enterprise requires adopting economic institutions and practices which generally increase levels of prosperity (Costanza et al. 1997). Unfortunately, these three dimensions often conflict with each other which causes inherent tensions between stakeholders and ethical dilemmas for those who seek to balance competing demands.

One of the core reasons that sustainability is such a contentious topic, from an ethical or moral perspective, is that it is very hard to describe an ultimately sustainable outcome for societies. This makes it difficult to balance competing analytical dimensions as there is no consensus about what can be classified as an ideally sustainable solution; thus, there is a proliferation of differing goals and methods to measure success (United Nations General Assembly 2015). As a result there are frequent opportunities to criticize whether policies, plans, or programs are appropriately balancing economic, social, and environmental dimensions. As multiple stakeholders each promote their preferred outcomes, and decry the potential injustice

inherent in other options, there are significant challenges for decision-makers who strive to determine an ethically superior sustainability strategy. However, it is often possible to determine whether a policy, plan, or program is unsustainable by recognizing when it leads to undesirable social, environmental, or economic outcomes (Bond et al. 2012).

The challenge of making ethical decisions about sustainability is ultimately one of balance within individual strategies and across a portfolio of policies, plans, and programs (United Nations General Assembly 2015). Some strategies may be more beneficial in some areas and less so in others. As an example, a program which supports students who cannot afford to go to school obviously has a social benefit, but it also increases resource consumption which could be environmentally detrimental. Similarly, a program which encourages the adoption of renewable energy will help mitigate climate change impacts, but this initiative may increase the price of electricity which creates hardships for the poorest in society. Clearly, uneducated children and rising sea levels are unsustainable outcomes, but the numerous potential strategies which alleviate these negative consequences lead to a wide variety of possible trajectories of sustainability to choose from. It is often very difficult to decide which of these pathways is more ethical or how to create additional strategies to bring them into alignment. Without the absolute understanding of right and wrong that can come in other decision-making practices, determining the ethics of sustainability means dealing with a myriad shades of gray.

The primary objective of this chapter is to unpack the ethical challenges posed when developing sustainable strategies. After discussing these issues, this chapter will provide guidance around the development of sustainable policies, programs, and practices which incorporate the perspectives of multiple stakeholders while achieving a balance between social, economic, and environmental responsibility. Ethical considerations are a key component in determining whether solutions are sustainable and of deciding which practices achieve more desirable outcomes. Sustainability is not an issue which can be addressed only by environmental science or scientist-practitioners; there are clearly moral and ethical dimensions which impact the degree to which governance strategies can be considered as right or wrong, responsible or irresponsible, just or unjust, and ultimately sustainable or unsustainable.

This chapter is organized as follows; initially the three pillars of sustainability are defined and discussed. After unpacking these core dimensions, the distinct ethical traditions and approaches which relate to each component are explored. Having pulled these threads of sustainability apart, practical guidance around developing strategies intended to achieve sustainability in an ethical manner is provided. The intent of this chapter is to demonstrate that the effort of striving toward sustainability becomes a type of meta-ethical process which can support the alignment of a wide-ranging set of public policy and administrative topics that are intended to lead to the betterment of society.

## Defining Sustainability

The concept of sustainability rose to prominence in research related to economic development conducted by the Brundtland Commission in the 1980s. This culminated in a groundbreaking report which stressed the adoption of sustainable development strategies (Brundtland 1987). The often-cited definition of sustainability coming from Brundtland's work centers on meeting the needs of today's societies without compromising the needs of future generations. Over the past decades, numerous definitions of sustainability have emerged, and many of these stress a combination of environmental responsibility, social justice, and economic development. However, this entwined definition is frequently overlooked in common practice. As a result the label of sustainability is often used to denote "green" solutions, policies, and initiatives which focus primarily on environmental responsibility. Narrower definitions may make sustainability more ethically tractable but also serve to weaken the core concept. To fully explore the complexity of the ethics of

sustainability, this chapter uses the more holistic meaning which relates to improved quality of life today and for future generations. This broad definition underpins much of the effort by the United Nations to develop and advocate for sustainable development goals (United Nations General Assembly 2015) and also specific issues such as climate change (IPCC 2014). The all-encompassing nature of sustainability is what makes it so difficult to address with typical policies, programs, governance mechanisms, and actors. This section will provide an overview of the economic, social, and environmental dimensions of sustainability as independent elements and demonstrate how they are entwined with each other.

### Economic Dimensions

Brundtland's definition of sustainability came from a study primarily related to economic development (Brundtland 1987). The economic dimension is a critical component of sustainability. Many governments focus on improving quality of life by increasing economic activity, often measured in aggregate by calculating gross domestic product (GDP). Despite the fact that many national economies are dominated by public sector activities, in practice economic development often focuses on increasing the activity of private sector firms. From a neoliberal or neoclassical economic perspective, firms are socially responsible when they focus on increasing their profits. However, there are concerns that primarily focusing on the well-being of shareholders rather than broader stakeholders has led to rising levels of socioeconomic inequality and exacerbated environmental degradation (Costanza et al. 1997; Rockstrom et al. 2009; White et al. 2016). These concerns demonstrate that economics, as currently practiced, is unable to solve the issue of sustainability.

Without well-managed and smooth-running economies, societies would collectively have much lower standards of living. The interconnectedness of the global economy, and its link to standards of living, was quite visible after the financial crisis of 2008, when economic instability caused many people to lose their homes and jobs and negatively impacted their well-being. Though the crisis also led to a reduction in pollution as business activity slowed, few would label the negative social impacts that resulted from the economic downturn as an ideally sustainable solution. Many of the inputs to economic activities come from raw materials sourced from the environment, yet economic models frequently fail to capture the cost of environmental degradation caused by pollution or post-consumer wastes (Costanza et al. 1997). As societies seek to grow economic activity, there is a need to ensure that increasing GDP does not negatively affect the supporting environment.

### Social Dimensions

The second core dimension of sustainability is the social component (Brundtland 1987; IPCC 2014; White et al. 2016). Sustainability is ultimately an anthropocentric notion; it relates primarily to objectives and outcomes intended to maintain or improve standards of living for current and future human populations. Brundtland expressly addressed the social component when talking about meeting the needs of societies today and tomorrow; these needs are directly associated with increasing the quality of life for all global citizens. Common social objectives associated with sustainability include reducing poverty, hunger, and disease as well as increasing access to education, clean drinking water, and basic health services (United Nations General Assembly 2015).

Any policy initiative with positive economic or environmental outcomes which does not also provide for positive social benefits cannot be described as fully sustainable. The need to balance environmental responsibility in a way that does not exacerbate inequalities of socioeconomic status or other challenges faced by disadvantaged populations is a key component of work done by the Intergovernmental Panel on Climate Change (IPCC) in a variety of their reports but primarily in their human security chapters (IPCC 2014). Though addressing climate change is an environmentally and economically significant challenge, any solutions which create detrimental outcomes for disadvantaged populations are likely to be

unsustainable over the long term. Thus the recent Paris Agreement on climate change has provisions which stress the need to increase human security and promote sustainable development while also working to curb the greenhouse gas emissions which have led to climate change.

### Environmental Dimensions

The most salient dimension of sustainability for many people is the environmental component. The need to address ever-worsening environmental degradation is often the primary rationale for developing policies, plans, and programs related to sustainability. The USA drafted the world's first comprehensive environmental legislation, the National Environmental Policy Act of 1969; this act has been updated numerous times since its introduction, and many other governments (national and subnational) have also enacted environmental protection legislation. Additionally, many jurisdictions now require environmental assessment of development projects and strategic actions prior to implementation (Bond et al. 2012). Many of these assessment practices focus on limiting the negative environmental impacts of policies and projects as well as offering mechanisms to increase stakeholder consultation around environmental issues. Sustainability also encompasses management of upstream resources, and a host of efforts have been developed around environmentally responsible management of the forestry and fishing sectors, among many others, to ensure that the collective human enterprise does not draw down too heavily on the natural resource base which supports the global economy (Costanza et al. 1997; Cashore et al. 2007; Rockstrom et al. 2009).

## Integrating Three Ethical Traditions Under the Heading of Sustainability

Each of the three dimensions of sustainability has an extensive body of literature related to ethics. My goal is not to summarize in full each of these traditions. Rather, this section highlights a few areas to provide a starting point to begin thinking about the complexity of determining what is ethical when developing governance strategies related to sustainability.

A common exercise for thinking about ethics puts people in the position of deciding whether to allow a train to continue along a track that has five people working on it or to divert the train to another track on which only one worker is at risk. This simple linear exercise can provoke substantial debate about the morality and ethics of making such a decision. Translating this example to the concept of sustainability would require an examination of the near-term impacts on the workers in question from a single train and also consider multiple trains on converging tracks each with different numbers of workers at risk. The decision-making process could be further complicated by factoring in the well-being of the passengers on all trains, the mechanical stresses of switching tracks, costs of making such changes, and impacts these decisions could have on future riders of the transit system. The complexity of addressing issues related to climate change can be staggering; moving beyond this single topic to encompass the full spectrum of sustainability is more challenging by orders of magnitude (Rockstrom et al. 2009; IPCC 2014). The decision about what is an ethical solution in matters of sustainability can rarely be simplified to simple arithmetic calculations of near-term effects. This said, the inability to gauge the point at which solutions can be said to be ultimately sustainable does mean that no action should be taken or that it is acceptable for decision-makers to avoid making a decision due to the complexity. Rather, just as in the case of the train operator, developing ethical strategies related to sustainability must rely on as comprehensive an understanding of the situation as the facts at hand provide. Fortunately, sustainability allows for adaptive management; such that if one determines that past decisions are leading down the wrong track, then there is an opportunity to change directions later toward a more idealized long-term outcome.

### Environmental Ethics

There are numerous well-developed streams of research on environmental ethics. Perhaps the most well-known approach advocates a deep-

ecology or deep-green position (Costanza et al. 1997; White et al. 2016). This ethical positioning stresses the primacy of natural systems over human society and organizations. The moral or ethical approach here is to consider humans and society as being a part of nature. In this line of reasoning, there is no ethical imperative to preserve human life if it comes at the expense of nature. A deep ecological perspective would suggest that any prioritization of humanity over nature will eventually lead to society's ecological footprint extending past natural carrying capacities, which could lead to a cycle of population overshoot and collapse.

### Social Ethics

This is perhaps the most-discussed domain of ethics and so will not be explored to a great degree in this chapter. Ethics originated as a type of moral philosophy primarily concerned with human well-being and determinations about whether the way individuals treat each other is moral or amoral, right or wrong, or just or criminal. There are long traditions of exploring ethical behavior in religious, philosophical, and political domains. The key dimension to remember about this domain is that social ethics is primarily focused on how people treat others in society and members of other societies; there is little concern for non-sentient individuals who comprise the animal or plant kingdoms nor for nature writ large.

### Economic Ethics

This is perhaps the most complex of the three dimensions of sustainability to explore in terms of ethics. Economics as a general academic discipline, and economists as individuals, strive to improve human well-being but often overlook how that goal is fundamentally entwined with ethics (DeMartino 2011). The global economy is currently dominated by the neoclassical school of thought, but there are numerous traditions which can influence policy-making that also fall under the broad heading of economics, e.g., classical, Marxist, Keynesian, Austrian, etc. (Costanza et al. 1997). All of these approaches seek to increase or support society; yet they do so in very different ways or even in similar ways with very different rationales. For example, neoclassical economists would stress the best way to increase well-being is through a free market and that the most socially beneficial thing a corporation can do is generate profit for shareholders while those aligned with Marxist tradition would argue that organizations should exist to better society and not shareholders. Many economists might suggest unregulated markets are superior to regulated markets; however, while the neoclassical school feels this stems from trust in individual consumers to do the right things for themselves, the Austrian school suggests that markets are perhaps too complicated for individuals to interfere with without causing more harm than good.

There is no possible way to reconcile all of the ethical traditions of these various economic perspectives within a short section. However, there are a few things to note when thinking about sustainability and economics. First is that while the modern global economy is mainly comprised of capitalist economies, there are variety of ways that capitalism is practiced in various countries. The second main takeaway for readers is that just as there are a variety of ways of conceptualizing the interface of human society and the environment, so there is a variety of ways of approaching social well-being in economic theory. Ecological economists are most closely related to deep-ecological perspectives, while many who study environmental economics are more closely related to neoclassical approaches to studying how natural resources support local and global economies (Costanza et al. 1997). Many of the economic traditions which expressly focus on the natural environment offer a more accessible path to consider economic ethics as it relates to sustainability.

Just as there are numerous ways of thinking about social well-being or humanity's relationships with nature, there are a wide variety of approaches in economic theory. While this serves to increase the number of variables involved when deciding about the ethics of sustainability in an abstract way, it also opens the door for a wide number of approaches which may be considered ethical in practice depending on where, how, or why they are implemented. This wide variety of niche approaches can help enable the

development of a more collective agreement around ethical guidelines for the development of sustainable policies, plans, or programs by providing a number of examples which can be compared against each other. Using a pairwise system of comparative evaluation allows us to avoid the inherent complexity of determining a theoretically ideal approach based on first principles and allows us to compare the rich nuances which exist among different approaches.

## Practical Guidance for Developing Ethical Sustainability Strategies

There is no easy way to combine environmental, social, and economic dimensions of sustainability without clashing ideas about morality and ethics. While this theme has permeated the entire chapter, it is important to stress that this does not mean it is impossible to make some decisions regarding how to achieve more sustainable ends. In fact, approaching sustainability with ethical considerations foremost in mind is potentially the best way to keep all three dimensions of sustainability in balance and ensure developing positive policy outcomes.

The most commonly used approach to ensure that strategies intended to achieve sustainability goals are ethically founded is to consult a wide variety of stakeholders, including scientific researchers, during the policy-planning process. This removes the paralyzing pressure felt by public policy professionals or government ministers who feel forced to make all the decisions alone. By including a wider array of voices, it is less likely that any one stakeholder group will feel that the final policy solution unjustly penalizes them. This section looks at three approaches to ensuring multiple stakeholders and scientific evidence are involved in the development and adoption of sustainability strategies: cross-sectoral partnerships, following the precautionary principle, and using impact assessment processes.

Cross-sectoral partnerships are highly effective in developing governance strategies which have the support of the public and private sectors as well as civil society more generally (Cashore et al. 2007). These approaches are sometimes referred to as partnered governance. These partnerships should involve multiple individuals and stakeholder organizations when developing strategies intended to further aims associated with sustainability. Partnered governance has demonstrated the ability to realize effective outcomes in education, civic planning, industry self-regulation, environmental governance, and many other areas. One specific area which holds much promise is in the development of sustainability standards. These standards have supported the adoption of sustainable practices in industries like fishing, forestry, and coffee, palm oil, and chemical production (Cashore et al. 2007). Some of the best-known sustainability standards include fair-trade coffee, the Marine Stewardship Council (MSC), the Forest Stewardship Council (FSC), and the Roundtable on Sustainable Palm Oil (RSPO) which support sustainable governance through the involvement of various state and non-state actors.

Working on determining ethical guidance for developing sustainability standards should involve appropriate scientific investigation of environmental conditions and potential risks. One way of considering the ethics of any given situation is to use the precautionary principle. At the core of this concept is the notion of making ethical decisions based on the potential impacts of plausible risks to the environment, public health, and technology. "Born of environmental considerations, the precautionary principle has since matured into an ethical principle with a far broader scope and the potential value of the precautionary principle as a policy guide should be envisaged" (World Commission on the Ethics of Scientific Knowledge and Technology 2005).

Another approach to bringing science and stakeholders into the evaluation and development of sustainability strategies is through adopting impact assessment processes. A wide variety of these approaches have been developed; many practitioners and researchers who focused on improving these assessment processes are members of the International Association for Impact Assessment (IAIA). Though early-stage environmental impact assessment started with a focus on

large-scale development processes, there are now a host of techniques which support evaluating sustainability programs, health and social policies, strategic decision-making, and the cumulative impacts of the human enterprise (Bond et al. 2012). Guidance around impact assessment processes stress multi-stakeholder engagement processes when they are used as an approval mechanism and the need to monitor decisions after they have been made to ensure that interventions are achieving desired outcomes.

A final consideration is for national and subnational governments to avoid setting goals, but rather adopt goals from other organizations. This could include adopting the challenge of reducing greenhouse gas emissions to help mitigate climate change or focusing on the United Nation's Sustainable Development Goals (United Nations General Assembly 2015). Many of these goals are determined by multiple stakeholders and adopt significant scientific input. This approach helps to support an ethical rationale for pursuing sustainability and provides clear targets to evaluate success.

All of these approaches are presented as ways of starting to move toward ethical policy development processes when addressing challenges related to the environment, social well-being, and economic development. This list is by no means exhaustive, but is intended to give the reader a sense of how stakeholder collaboration and scientific research support the development of governance strategies related to sustainability.

## Conclusion

Achieving sustainable outcomes is not an easy proposition nor is balancing ethical concerns when developing strategies intended to realize them. There is a need to balance multiple stakeholder voices, as well as the perspectives of stakeholders who cannot raise their own voice. Though the ethics of sustainability are complex, this challenge can be overwhelmed by basic good governance approaches which involve stakeholders, leverage scientific research, and seek to do less harm while striving to improve the well-being of society. Addressing the ethics of sustainability is an ongoing challenge; ultimately the approaches which work in one jurisdiction may not work in others. Rather than adopting a single best practice solution, the most ethically and scientifically appropriate approach to more sustainable governance is to create a mosaic of strategies which all make incremental contributions and are tailored to fit the needs of different individuals and regions.

# Ethics Officers

Tim C. Mazur
Pratt and Whitney, United Technologies Corporation, East Hartford, CT, USA

## Synonyms

Chief compliance officers; Chief ethics and compliance officers; Chief ethics officers; Compliance and ethics officers; Compliance officers; Ethics and compliance officers; Integrity officers

## Definition

Ethics officers are employees of organizations responsible for managing ethics issues facing the organization both internally and externally.

## Introduction

Ethics officers are a relatively recent phenomenon in organizations. Research suggests the title that first appeared in the United States in the 1970s, when Cummins, Inc., created a position that shares much in common with current ethics officer job descriptions. Also, in 1978, the US Congress passed the Ethics in Government Act, which created the concept of an ethics official within each executive branch agency (ECOA Foundation 2013). In government, the role began only in a limited, technical capacity, but recent advances in the private sector have extended into the public sector, such that "best practices" among ethics officials now include much of what is connected with the private sector ethics officer.

The role goes by many names within organizations, including compliance officer, ethics and compliance officer, compliance and ethics officer, chief ethics officer, chief ethics and compliance officer, chief compliance officer, ethics official, designated agency ethics official, integrity officer, and many others (Swartz 2003). While it appears in almost all industries, public organizations, and nongovernmental organizations (NGOs), ethics officer remains mostly a position not legally required. This "optional" status is one reason why the word "ethics" succeeded the former word "compliance" (Paine 1994). Because creating the role is mostly a voluntary decision by organizational executives, only larger organizations, for the most part, choose to create an ethics officer position as the leader of their ethics program (also known as "compliance programs" or "ethics and compliance programs"). One industry, securities (e.g., broker dealers), still uses the term compliance officer exclusively in a mandatory, regulatory context, such that it has almost no connection to ethics or ethics officers.

## The Evolution of Ethics Officers

Ethics officers first appeared in the 1970s as a result of the evolution of the modern business ethics movement on university and college campuses (Weber and Fortun 2005). The role of US business in the 1972 Watergate scandal (e.g., secret contributions to the Committee for the Reelection of the President) and the Lockheed Corporation's Japanese bribery scandal (1976) motivated business school's to focus on the practical application of ethics in business, rather than look at business ethics solely as a branch of applied moral philosophy. Business ethics professors drew from many writings, including those of "the father of economics,"

Adam Smith, who was a moral philosopher. As Wall Street and other business leaders extolled Smith and his views on laissez-faire economics, the professors revealed that Smith believed laissez-faire would work only if businessmen chose to run their operations ethically, obviating the need for government ownership or excessive regulation (Rasberry 2000).

As the 1970s progressed into the 1980s, various technological and social changes motivated the proliferation of ethics officers. First, the wide expansion of cable television (TV) in the United States opened a channel of information to citizens that had previously been controlled by only four networks and a few powerful newspapers. The popularity of cable TV brought not only new networks, including CNN and Fox, but also a larger supply of information – including information about corporate misconduct – due to a shift to 24 h per day of programming. Second, the development of personal computers in the early 1980s led to Internet discussion groups and "listservs" that significantly increased flows of specialized information among interested parties around the world. When it might have been possible to "cover up" an act of corporate misconduct in the past, the personal computer empowered common consumers around the world to report such incidents. And third, also in the 1980s, primarily local and regional economies evolved into a truly global economy, which demanded common standards of business conduct beyond the 200-plus sets of national laws and regulations. In multinational companies, it was easier and more practical to train employees to honor common standards of ethical conduct than it was to teach every law, regulation, and ordinance in each country the employee visited or did business with (DiPiazza 2001).

In the early to mid-1980s, these new cable networks and personal computers became filled with stories of corporate fraud, including infamous examples of the US Department of Defense paying private contractors $435 each for thousands of $5 hammers and $640 each for thousands of $7 toilet seats. These scandals led to the creation of three government commissions – the US Sentencing Commission (USSC) (1984), the Treadway Commission (1985), and the Packard Commission (1986) – that, among many other accomplishments, challenged businesses to take more responsibility for preventing fraud and misconduct.

The Packard Commission resulted in the 1986 creation of the Defense Industry Initiative on Business Ethics and Conduct (DII), a voluntary program that listed six components of an effective corporate ethics program (ECOA Foundation 2013). Overseeing the implementation of these new "business ethics and compliance" components within each major defense contractor was a new, full-time job, so what was at the time only a handful of ethics officers around the world quickly became dozens. In 1991, the USSC pursued the same goal by publishing guidelines for sentencing organizations. A footnote in the guidelines followed the DII's lead by listing seven components of "an effective program to prevent and detect misconduct." Among these seven components was one that required the organization identify a person with "day-to-day" responsibility for running the compliance program (www.ussc.gov/guidelines/2016-guidelines-manual/2016-chapter-8, 2016). By the mid-1990s, dozens of ethics officers had become hundreds. Today, over 95% of *Fortune* 500 corporations have some version of an ethics officer, as do most US colleges and universities and many other large for-profit and nonprofit organizations (Treviño et al. 2014).

The sudden growth of this new type of organizational leader led to the creation in 1992 of the Ethics Officer Association (EOA) by Michael Hoffman and Craig Dreilinger (Adobor 2006). Its first gathering of 19 ethics officers revealed the need for a new organization and a new field. Why not simply be part of the Society of Human Resource Management, the association of human resource (HR) professionals? Because the government hearings that resulted in the USSC guidelines revealed that the US government did not want ethics officers to be located in HR, which was evolving into a profession focused on partnering with and empowering corporate managers. The government, in contrast, wanted ethics officers to stand up to managers who committed

misconduct and report them to the government if necessary.

Why not be a part of the American Corporate Counsel Association, the association of in-house attorneys? Because many public leaders and others felt that compliance officers housed in the Legal Department were preoccupied with protecting the company from liability. Also, ethics officers need to be skilled in writing clearly and delivering training, neither of which are skills taught in law school. So, in 1992, those 19 corporate representatives decided to create a new organization that would define "ethics officer" as a corporate role that had never existed before: an employee who worked to ensure "the right (ethical) thing" was done within the corporation, even if it conflicted with upper management (Hoffman and Rowe 2007).

In Europe, a similar role existed in the form of an Ombudsman, but the US variant has more compliance responsibilities and focuses on preventing and uncovering misconduct rather than simply waiting to hear from another employee (www.ombudsassociation.org/Resources/Frequently-Asked-Questions/What-is-an-Organizational-Ombudsman.aspx, 2017). Because the ethics officer role was originally defined as something new, to this day it attracts individuals from many different backgrounds. While compliance officers were historically trained only in the law, ethics officers come from backgrounds including finance, psychology, ethics, accounting, organizational behavior, strategy, human resources, law enforcement, and many others. This variety of expertise helps the ethics officer accomplish the 12 main components of her job:

1. Create, lead, and represent the ethics program and its staff.
2. Create and update the organization's ethical standards (e.g., values, code of ethics).
3. Create and implement ethics-related communications (e.g., policies, awareness-building information).
4. Create and implement skills-based training (e.g., moral sensitivity, ethical decision-making, moral courage, deriving principles from values and standards that can be turned into policies, moral intuition).
5. Create and manage an Ethics Helpline (e.g., offers anonymity, if desired) and a program to prevent retaliation against employees who report misconduct.
6. Create and manage incentives toward ethical behavior and reduce the number of incentives to commit misconduct (e.g., 2016 Wells Fargo scandal), investigate allegations of misconduct, and ensure that employees who violated the organization's ethical standards are disciplined.
7. Create monitoring policies and procedures, and a schedule of regular and "spot" audits, to ensure the ethics program achieves its goals.
8. Enhance the organization's existing enterprise risk management (ERM) plan with risks focused on ethics and integrity.
9. Develop and implement a plan toward improving the organization's ethical culture.
10. Create and implement metrics to evaluate the impact and effectiveness of the ethics program and then update and improve the program as a result.
11. Create and maintain key relationships with internal stakeholders including the organization's chief executive officer, president, chief operating officer, chairperson of the board, chairperson of the audit committee, chief finance officer, chief legal officer, chief learning officer, chief strategy officer, corporate secretary, head of internal audit, head of communications, head of security, and others.
12. Create and maintain key relationships with external stakeholders including the media, representatives from governments in which the organization operates, customers/clients, leaders of communities where the organization operates, and others.

Within the organization, the ethics officer is responsible for many ethics-related issues, though the list changes according to industry, countries in which the organization operates, and other criteria. A common list of issues an ethics officer is responsible for includes:

- General business ethics issues (e.g., breaking promises or otherwise violating commitments;

lying, deception, and other types of dishonesty; lack of integrity; unfairness; disrespect; other violations of the organization's values)
- Criminal compliance (i.e., compliance with criminal laws; some chief ethics officers manage compliance officers who oversee regulatory compliance, while others work with a chief compliance officer responsible for regulatory compliance)
- Conflicts of interest, self-dealing, and corporate opportunities (e.g., an employee stealing an opportunity that belongs to the organization)
- Unfair business practices (e.g., bid-rigging)
- Fraud (e.g., from multi-billion dollar schemes like Bernie Madoff to falsifying an entry in an expense report)
- Confidential or proprietary information (e.g., inappropriate use or theft of information belonging to the organization)
- Bribery and kickbacks (i.e., violating anti-corruption laws and regulations)
- Gifts and entertainment (i.e., "the ethics side" of bribery, where an employee gives or receives gifts or entertainment in a way that could or does alter her decision-making against the best interest of the organization)
- Retaliation (i.e., an employee retaliating against another employee because the latter used the helpline or otherwise helped the organization identify another employee who committed misconduct)
- Use of company assets (i.e., an employee secretly using 20 laptops belonging to the organization to run her own, separate business on the side)
- Sexual harassment
- Discrimination
- Theft
- Competitive intelligence, espionage, and other anticompetitive behavior (e.g., violations of antitrust laws or regulations or stealing information from competitors)
- Favoritism (e.g., promoting a friend even though she isn't the highest-qualified candidate)
- Insider trading (i.e., trading stocks on inside information whether it's illegal or simply unethical)
- Accounting irregularities/accurate reporting (in response to the Sarbanes-Oxley Act, the ethics officer must invite employees and non-employees to contact her if they are aware of accounting irregularities)

Current issues facing ethics officers are split between positive developments and negative realities. Among the latter is something that has plagued ethics officers from the beginning: a lack of respect among other leaders in the organization as well as externally (Treviño et al. 2014). Generations of businesspersons who never read Adam Smith mistakenly believe the sole purpose of business is to earn a profit and, thereby, that ethics has no value except in rare instances when it can increase profits. Fortunately, better ethics education in business schools is slowly eroding this fallacy, but it is still the case that many employees, managers, and executives do not understand, appreciate, or respect their ethics officer or the role she plays.

Feeding this disrespect is the difficulty associated with proving that the ethics officer is doing a good job (ECOA Foundation 2008). Think about it: if the ethics officer succeeds in improving the organization's ethical culture, then maybe misconduct that would have happened does not. But how does one measure this? How does an organization calculate the return on investment on misconduct that did not happen?

Another problem facing ethics officers is the legal profession's efforts to control the field. Ethics officers were born from the fact that compliance officers in the 1960s, 1970s, and early 1980s repeatedly failed to prevent preventable corporate misconduct. In the late 1980s and the 1990s, well over 90% of ethics officers were attorneys, but that number has dropped every year since (ECOA Foundation 2008). As recently as 2014, the Ethics and Compliance Officer Association (the new name of the EOA as of 2005) revealed that less than one-half of its members were attorneys. The legal profession has been fighting this loss of power by pressing general counsels to convince their CEOs that ethics officers must be attorneys.

Many attorneys serving as ethics officers ignore the ethics parts of the job, in an effort to return the role to its original position as a compliance officer. To achieve its goal, the legal community and others created a trade group – Society for Corporate Compliance and Ethics (SCCE) – to compete with the Ethics and Compliance Officer Association. Despite the word "ethics" in its title, the SCCE never has featured an ethics expert in its leadership (www.corporatecompliance.org/AboutSCCE/SCCEEmployees.aspx, 2017).

Another negative reality began in the early 2000s when the vendor community invented a new phrase, "governance, risk, and compliance," or GRC, to remove ethics from the programs run by ethics officers. GRC's proponents market it as the "solution" for organizations uncomfortable with the "softness" of ethics. Still other vendors replace the word ethics with "reputation," such that the ethics officer's goal is limited to projecting a positive image of the organization, rather than actually working to improve the ethics of the organization's behavior.

A final challenge confronting ethics officers revolves around what makes their role so unique. Employment in the United States is at will, meaning organizations can fire employees for any reason other than rare exceptions (e.g., discrimination). Ethics officers represent the first in-house role where the highest priority is to "do the right thing," even if doing so conflicts with the actions of, for example, the CEO. In other words, if the ethics officer performs her role properly, then she must confront the CEO or another executive if he is committing misconduct. The problem is, under employment at will, the CEO can easily solve his problem by firing the ethics officer. Over 100 ethics officers have lost their jobs in scenarios like this.

A solution to this problem is employment contracts, whereby the ethics officer if hired under a contract that stipulates can be fired only under specific, legitimate circumstances and only with the approval of the chairperson of the board of directors or its audit committee. While this is an excellent solution, it is believed that fewer than 5% of ethics officers possess employment contracts (ECOA Foundation 2013). A similar challenge is that most ethics officers are not covered by their organization's directors and officers' liability insurance, even though they are as likely as anyone in the organization to be called to testify in a court case.

On the positive front, ethics officers are seeing several advancements in the field. First, while most early ethics officers reported to the general counsel, "best practice" today has them reporting to the CEO, the COO, or even the chairperson of the board's audit committee (Hoffman et al. 2008). The strongest motivator for this improvement came from the Office of Inspector General of the US Department of Health and Human Services (OIG). Repeated failures in programs led by general counsels leading up to the early 1990s pushed the OIG to mandate that a program could not qualify as effective if it resided in the Legal Department.

Additionally, the importance of ethics in the work of ethics officers has been supported by recent global standards. First were the 2004 and 2010 updates to the USSC guidelines, when the word "ethics" or "ethical" was added to the legislation 62 times (www.ussc.gov/guidelines/2016-guidelines-manual/2016-chapter-8, 2016). In 2010, the Organization for Economic Cooperation and Development published its *Good Practice Guidance on Internal Controls, Ethics, and Compliance*, which highlighted the importance of ethics for the first time at a global level. In 2014, the prestigious International Standards Organization published ISO 19600, a new standard on compliance management that acknowledged the importance of business ethics. ISO repeated this acknowledgement in its more recent ISO 37001 standard addressing anti-corruption.

Other issues that represent a significant portion of an ethics officer's time include:

- Ethical culture – What does an "ethical culture" look like and how can one measure the ethics of an organization's culture?
- Whistleblowing – The 2013 actions of Edward Snowden has risen the profile of whistleblowing. Is it a good, courageous thing for an insider to blow the whistle when efforts to address misconduct internally have failed? Or is such external

reporting a violation of the insider's commitments to protect confidential information?

- Transparency and social media – The prevalence of employees and others with smartphones, that can record video or audio and instantly access the Internet, offers ethics officers new opportunities to invite employees and customers to shine a light on misconduct within the organization.
- Behavioral ethics – Scholars have delivered extraordinary research in the early 2000s on the psychology behind misconduct. Ethics officers now have numerous tools and other resources to help them reduce incentives toward unethical behavior and even measure the ethics of prospective employees during the hiring process.
- Corporate social responsibility (CSR) – CSR is a branch of business ethics, yet the two fields evolved within organizations separately. Now that both have achieved greater power, ethics officers seek to combine the ethics program with the organization's CSR or sustainability program to ensure they integrate with and complement, rather than conflict, with one another.

## Conclusion

The concept of an ethics officer took off in the early 1990s and now involves tens of thousands of individuals around the world. While the field has grown, it continues to face threats from internal and external forces. The Ethics and Compliance Officer Association was once a stalwart leader of the field, looking out for its members' interests and working to direct the field's evolution, but in 2014 its board combined it with another organization and changed its name. For the first time in its history, the organization features no one with a background in ethics among its management (www.ethics.org/about/staff, 2017).

The field had been focused on whether to evolve into a profession, such that ethics officers would need to be certified or licensed. Strong arguments appear on both side of the debate. For now, certain law schools (e.g., Université de Cergy-Pointoise in France) and business schools (e.g., Leeds School of Business at the University of Colorado, Boulder, in the United States) have created degree programs that invite students to a more formal education on how to excel as an ethics officer. Finally, the future of ethics officers lies in their ability to earn respect among their organizational colleagues, so much so that they earn "a seat at the table" where the highest executives discuss strategy, such that ethics officers truly can improve the ethics of the organization by being a factor in decisions from the outset.

## Synonyms

Ethics in administrative action

## Introduction

Public policies are the means through which politics allocate values (Easton 1965). Hence, public policies have to do with the proper indication of problems to be solved in a society and to the choice whether (and eventually how) the public authorities should act, in order to solve those problems (Donahue 2003).

In such a complex context, the role of ethics is potentially basic: according to a famous paradox, because other issues are more important than ethics, ethics is more important than any issue (Thompson 1992). In fact, ethics refers to the group of rules and values functioning as standards to assess the integrity of a subject's action (Huberts 2014).

The topic of ethics policy has been the object of various studies, in different scientific fields, since the 1970s. They regard both ethics of the general choices taken by administration in the public interest and ethics of the public servants' behavior. Actually, the details of the concept are not totally shared in a compared perspective. Generally speaking, in Europe, public integrity is related with "thinking" and with "doing"; it has to do with professionalism and has an important organizational side. In the USA, ethical decision-making is often assumed to be at the core of good management and it is frequently linked with administrative reforms (Cox et al. 2009).

## Preliminary Concepts and Theoretical Background

Both public officials and the public at large should be provided with a common frame of reference, regarding the principles and standards to be applied.

There are essentially two models in the study of public ethics: ethics of the sovereign good and ethics of the service of goods (Radhika 2012). The former aims at producing a set of guidelines about what is good in a collective perspective, but its weak point is that it is normally not able to take into consideration all the relevant variables (for instance, financial sustainability of administrative

decisions). Ethics of the service of goods, instead, lays on the idea that people can choose what they need and they can enter into agreements with each other to obtain what they consider good; but, of course, this view leads to individualism.

Moreover, in making ethical decisions, three main approaches may be followed. First, according to the virtue/intuition approach, a person, who knows what being moral means, shows honesty, integrity, and fairness in his/her behavior. Second, the deontological approach is based on a set of agreed principles to guide public action. Third, the teleological approach is based on the evaluation of the consequences of the action (Rosenbloom et al. 2009). Notwithstanding the three criteria are often used in combination, ethics is an aspiration to ideal excellence and therefore it is almost impossible to implement, fulfill, and measure it in its practical results.

As it was clearly shown in the field of contrast to corruption, there is in reality no way to correctly measure ethics (or its breaches) (Anechiarico and Jacobs 1996). Public policies aiming at it must always make a comparison, in terms of proportionality, between the means employed and the desired results. So, public ethics is not an absolute value in itself, and the ethical choice in public administration cannot be reduced to the alternative between following or not following the rules: ethics and legality are not synonyms.

Administration has an ethic duty to observe the rules in force, but specific rules of law may be non-ethic or they may conduct to non-ethic concrete effects. Therefore, ethics policy may be concerned with producing and implementing best practices, in order to comply with the statutes in force and, at the same time, to make public action more and more compatible with ethics. This needs a careful balance among values, because the respect for ethical standards may go beyond the legal requirements. A good example of this tension is the legal and administrative treatment of whistle-blowing, which is very different (and sometimes absent) in the various legal systems. It starts being encouraged by some legislators to overcome severe phenomena of maladministration; however, there are cross-cultural differences in the ethical perception of this tool, which is based on the dilemma of conflicting loyalties.

From the point of view of fair administration, it is important to grasp the distinction between discretionary and non-discretionary power. Only the former, in fact, requires officers to balance interests while emitting individual measures and, in such cases, a deeper attention for ethical values must be paid. Of course, a basic (even if preliminary) question regards how public interest itself has to be identified: approximately, one could say that it is the greatest good for the greatest number, but the respect for minorities and dissenting voices is an (ethic as well as legal) priority.

The benchmark is the indication of a shared group of principles. The most important and most ancient ones are, of course, the respect for the rule of law, impartiality and equal treatment, whose main corollaries are transparency and accountability. Transparency is at present considered in many countries as a basic value, not only with reference to administrative action in strict sense, but also with reference to the exercise of public power in general (accordingly, for instance, various statutes, all over Europe, regulate access to public information, especially in light of the 2009 Council of Europe Convention on Access to Official Documents: https://www.coe.int/en/web/conventions/full-list/-/conventions/rms/09000001680084826). Accountability, reliability, and participation by the private stakeholders (in the emission of individual measures) and by population at large (in rule-making, programming, and planning action) have progressively been affirmed, in the statutes, in the case law of administrative courts and in the best practices.

## Ethics Policy in Transforming Context

In the latest years, the scientific and practical approach to ethics policy has changed its physiognomy, because of the recent deep mutations in administrative action, essentially due to three main different factors: privatization,

globalization, and the impact of modern technologies (MacKinnon and Fiala 2015).

Privatization has regarded, since the second half of the XX century, many legal systems and has determined the progressive contraction of public bodies from certain fields, being replaced by (at least formally) private subjects. Consequently, in those areas, the administrative involvement is not direct anymore and turns to rule-making and supervising. Therefore, open issues arise, in the perspective (from a side) of assuring as well the protection of the public interest and (from the other side) of avoiding maladministration in the interweaving with profit-oriented activities. An indirect effect, coming from privatization, regards the indication of criteria for public ethics. The mutual approaching of private and public law has produced a sort of osmotic relationship between behavioral rules. In fact, besides the (so to say) "traditional" principles of fair administration, new parameters have been acquiring value. Among the "new" administrative principles, efficiency, efficacy, reduction of costs and good performance levels are comprised. Such principles are especially linked with service providing duties and customer satisfaction, where an interesting tool is the progressive diffusion of Citizen's Charters.

Another important element of change regards globalization. As it is well known, globalization nowadays regards every field of life, here comprised public law. The interaction among national legal systems and the supranational ones has determined a fragmentation of powers and responsibilities. So, there is a strong necessity to set out (if not directly binding specific common rules, at least) common principles about good administration.

The last, but not least, element has to do with modern technologies, whose development clearly has changed the technique of administrative action – in itself and in communication with private parties – and has also created new possible chances of maladministration and corruption.

All these factors of complexity require the respect for paradigms of professionalism and expertise by public servants.

## The Role of Codes of Ethics

The emission of codes of ethics may be useful in managing the complex problem of public ethics (Meine and Dunn 2013; Ochoa and Graycar 2016).

This is a best practice in many legal systems, at the local institutional level, at the national level, and even at the supranational level (for instance, in the European Union, the Code of Good Administrative Behaviour was adopted by the European Parliament in 2001, containing both legally binding rules and just ethical principles: http://ec.europa.eu/transparency/code/_docs/code_en.pdf).

The open issue with regard to these tools is their legal value. Tendentially, one could infer that, if there is not an expressed reference to them in a legal source, they work as guidelines to implement best practices. However, they rule specific behaviors which are particularly frequent in the field of competence of the concerned bodies. So doing, they can help officers and employees in avoiding not only illegal but also unfair conducts, indicating the link with the general principles. They also have the function to create a sort of preventive consciousness about the ethical dilemmas that administration must face in its daily action.

The growing creation of codes of ethics to rule administrative behavior shows that, in the legal systems, there is a pending search of a balance between the normative and the empirical needs related to ethics policy. Their wide formulation demonstrates the difficulty of transforming ethical values and criteria, which are essentially relative, into still rules of law.

## Ethics Policy and Administrative Organization

The acceptance in a legal system of ethics as a guide concept for public policies is likely to affect not only administrative action but also organization. From this point of view, it has to do with ancient mechanisms (such as simplification of structures and procedures, decentralization, and

de-bureaucratization) and with the experimentation of more modern tools (such as citizen partnerships and the implementation of public management techniques).

As a sort of macro-principle, the separation between politics and administration (frequently accompanied by the spoil-system rule) is nowadays commonly accepted. If democracy is the legitimation source of the members of the governments, the rules about recruitment and career path assure competency, professionalism, and expertise of public servants. These issues are normally founded upon some national constitutional principles, such as good administration and loyalty of public employees that assure accountability.

In the perspective of administrative organization, accountability may refer to a duty to respond to a hierarchically superior authority. In a more substantial perspective, it may refer to a duty to take responsibility for decisions in front of the stakeholders and of society in general. The impact of "hierarchical" and professional accountability may lead to different concrete results. Therefore, in the evaluation step, there is not a one-size-fits-all model.

A consequence of the growing importance of accountability in administrative action leads, in many legal systems, to the rules that compel the appointment of an officer responsible for the single administrative procedures. He or she has the duty to maintain a constant dialogue with the stakeholders, in order to let them fruitfully participate in the decision-making process.

Another important instrument, used in many legal systems (at the local, at the national, and, sometimes, at the supranational level, like in the European Union), is the institution of independent authorities with supervising powers and of ombudspersons. Taking inspiration from the Scandinavian countries, ombudspersons normally hear citizens' complaints, conduct independent investigations and manage conflicts, often with the purpose to contrast maladministration. Their action is essentially governed by the principles of neutrality and fairness. As their intervention is based on flexibility, they are able to manage individual conflicts, taking into account the specific factual elements of each case; so doing, they can overcome the problems connected with administrative bureaucracy and formalism. Therefore, the constitution of ombudspersons can be considered as an expression of ethics policies, because they help in preventively solving conflicts and watch over the authorities' action to assure good administration.

Quite similarly, to promote ethics policies, one of the most frequently used tools by the legislators is the creation of specific bodies aiming at contrasting corruption and at controlling the destination and distribution of public funds (for instance, in the USA, the federal and national Offices of Government Ethics: https://www.oge.gov/).

Last, but not least, an interesting instrument is the accreditation system. It is used, especially to guide the administrative choices of public contractors, in order to grant a minimum level of quality to manage risks and reduce costs. The decisional competence is up to accredited conformity assessment bodies, working both at the national and at the supranational institutional level (for instance, in the European Union, https://ec.europa.eu/growth/single-market/goods/building-blocks/accreditation_en).

## Ethics Policy and Administrative Communication

As ethics is connected with the aim at fulfillment of the public interest, public reporting and the creation of efficient communicative circuits among civil society and administration plays of course a basic role.

First, this is strictly linked with building a sense of confidence and trust from the citizens toward authorities. There is a sort of paradox: if, to be really ethic (or ethically open), administration should search and eventually reveal all cases of integrity violation; at the same time, this may conduct to a decline of trust by the population. Consequently, in this perspective, the provision for legal tools to prevent maladministration grows in importance.

Second, especially in light of the progressive complication of public action, a constant dialogue with all the stakeholders and actors is necessary, in order to administrate to become a learning organization (Senge 2010). The role of society in this dialogue is not only to ask questions and put in evidence needs to be satisfied but also to suggest solutions and methods to face problems. Therefore, a deep attention to the creation and implementation of participatory procedures in decision-making must be paid. In fact, the citizens' "activism" is able to bring useful inputs to the competent authorities.

Third, mass media may work as "sentinels" against corruption and maladministration. There are some examples of nonprofit investigative news organizations, which play, from this point of view, an important role (for instance, the Center for Public Integrity, founded in 1989 in the USA).

## Conclusion

Ethics policy globally impacts on administration. It is able to influence both organization and action. Moreover, it has to do both with sound administration as a whole and with the individual behavior of servants. It regards the "internal" management of administrative action, but it also deals with the relationship of the authorities with the citizens in order to emit individual measures, to produce plans and programs, and to properly choose private parties as service providers.

As cultural pluralism is a common characteristic in all modern societies, awareness of relativism of values should always guide public ethics policies. Even if a small group of macro-principles are globally shared, in fact, they are often differently perceived in the various systems.

Hence, more than aiming at specific results (whose value is possibly differently measured in different contexts), ethics policies in administration could be pursued by ruling efficient mechanisms of checks and balances, in order to assure from a side the fair exercise of power and contrast to maladministration, from the other side a constant perception of the satisfaction level of citizens. Thus, the respect for legal procedures to reach good administrative decisions through a fair and complete inquiry step and the duty of public authorities to give reasons for their decisions may be important tools to grant that ethic public choices are taken. It is no accident that, even if with relevant differences, the basic rules governing administrative procedures are shared in all the national and supranational legal systems. To be ethical, administration must not eliminate conflicts that are inerasable in every society. It is expected to be able to manage conflicts in order to take proper decisions, keeping into account all the relevant variables.

Therefore, the legal tools which may be used to obtain good results in terms of administrative fairness are concretely heterogeneous. They consist of principles, legally binding rules, and best practices. Such a variety of instruments is perhaps necessary to face the different problems connected with the duty of public servants and bodies to respect criteria of integrity, also beyond the binding rules.

Anyway, just punishing wrongdoing is not enough. On the contrary, to promote efficient ethics policies in administration, it is also necessary to encourage best practices and good behavior through an incentive system.

# Ethics Training

Hana S. Callaghan and Kirk O. Hanson
Markkula Center for Applied Ethics, Santa Clara University, Santa Clara, CA, USA

## Synonyms

Anti-corruption training; Conflicts-of-interest training; Government ethics education; Government ethics training; Public administration ethics training; Standard training for public officials

## Definition

Government ethics training programs are those designed to teach public officials and civil service employees the laws, standards of conduct, and ethical values required of those in government service by the public that they serve.

## Introduction

Integrity in public service has been identified globally as a governing principle of sound public administration. Multiple United Nations resolutions, recent promulgation of public codes of conduct in nations around the world, and a growing body of ethics laws and regulations give witness to an international trend attempting to create better government at all levels. (See, e.g., United Nations Resolution A/RES/49/136 of 1994, United Nations Resolution A/RES/50/225 of 1996, United Nations Resolution A/RES/56/213 of 2002, United Nations Resolution A/RES/57/277 of 2002, United Nations Resolution A/RES/58/231 of 2004.) In order to implement public integrity programs, there has been an increasing focus on state training of government officials and employees about the ethical standards and laws regulating public conduct.

Some ethical norms that are the subject of training are specific to the particular jurisdiction and national setting. However, many ethical

norms are based on the classical and traditional understanding of the relationship between public actors and the public that they serve. When individuals choose a career in the public sector, or a period of public service, they affirmatively take on the role of fiduciary to the people because they hold a position of trust and are tasked with acting on behalf of those they are sworn to serve. As stewards of the public trust, they are considered to have a fiduciary responsibility to act in a manner that is loyal to the public by putting public interest before personal gain, that is fair and unbiased, and that fulfills duties of competency, integrity, accountability, and transparency. Government ethics training programs seek to educate the public servant about these public sector responsibilities.

This article first presents the history and current status of ethics training within context of the United States, the national setting in which ethics training is the most common and advanced. The article next turns to the global setting with a brief discussion of the United Nation's concerns about public service ethics followed by highlights of ethics training programs in England, India, and China. The article concludes with recommendations for the best practices in the provision of government ethics education.

## Ethics Training in the United States

### History

The concept that government officials have special ethical obligations is actually quite old. In Ancient Greece Plato's Laws called for death for public officials who took bribes (Cooper and Hutchinson 1997, at 955d). In 1215 King John of England signed the *Magna Carta* which promised among other things, "To no one will we sell, to no one deny or delay right or justice" (*Magna Carta* 1215, at cl. 40). In 1254 King Louis the IX of France promulgated conflicts-of-interest rules for provincial governors in the *Grande Ordonnance Pour la Réforme du Royaume* (Davies et al. 2013). In 1781 in the United States, the *Articles of Confederation* included bans on officials taking gifts from foreign kings to ensure public officials' loyalty to the people of the United States (*Articles of Confederation*, art. V). This ban was later enshrined in the Constitution of the United States:

> No Title of Nobility shall be granted by the United States: And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince or foreign State. (*US Const. art. I, § 9*. capitalization in original)

The US Constitution further provides that each chamber may "Determine the rules of its proceedings, punish its members for disorderly behavior, and with the concurrence of two thirds, expel a member" (*US Const., Art. I, § 5*). From 1789 to 1964 for the Senate and 1967 for the House, each body dealt with member discipline on a case-by-case basis. In 1958 Congress established the first *Code of Ethics for Government Service* following an investigation of presidential Chief of Staff Sherman Adams. The Code was not legally binding, however, because it was adopted by a Congressional resolution – not law. In the 1960s ethics scandals involving the Secretary to the Majority Leader Bobby Baker in the Senate and Representative Adam Clayton Powell in the House prompted both chambers to write codes of conduct for members and to create permanent ethics committees (Straus 2011, 2013).

In 1965 President Johnson signed Executive Order 11222 which established standards of conduct for Executive Branch officers and employees (3 CFR 1964–1965, p. 36). In the wake of Watergate and the resultant distrust of government, Congress enacted the Ethics in Government Act of 1978 which established the Office of Government Ethics (OGE) to oversee Executive Branch conduct. In 1993 OGE promulgated ethics rules for all Executive Branch agencies and departments (OGE.Gov).

With increasingly complex ethics rules and regulation, the need for ethics training for government officials and employees became apparent. In 1977 the Senate Select Committee on Ethics was created. In 2007 the Select Committee was given jurisdiction to "conduct ongoing ethics training and awareness programs for Members of the

Senate and Senate staff." This training is mandatory (2 USC § 72a-1h; Straus 2013).

The Ethics Reform Act of 1989 established the House of Representatives Office of Advice and Education in the Committee on Ethics. The Office of Advice and Education was charged with "Providing information and guidance to members, officers and employees of the House regarding any laws, rules, and regulations, and other standards of conduct applicable to such individuals in their official capacities. . .." As of the writing of this article, annual ethics training is mandatory for all House employees. New members must take training within 60 days of taking the oath of office (Straus 2011; Ethics.House.gov).

The Office of Government Ethics ("OGE") provides training for 4,500 ethics officials in more than 130 federal departments and agencies. These ethics officials in turn provide training for 2.7 million federal employees. In 2013 OGE launched the Institute for Ethics in Government as the home for all of OEG's educational offerings (OGE.gov).

As government ethics programs were developing in the US federal government, the 50 US states were also creating ethics commissions or committees charged with promulgating government ethics rules and training requirements. As of this writing, almost all states offer some form of ethics training. The National Conference of State Legislatures has complied information detailing the status of ethics training programs in all of the 50 states which can be found on their website at NCSL.org.

Within the states, many local government bodies including counties, municipalities, and special districts also have codes of conduct and ethics training requirements. In California, for example, all public officials are required to take 2 h of ethics training every 2 years. This is commonly known as AB 1234 training after the legislation passed in 2005 (Cal. Gov. Code § 53235).

## Topics Generally Covered in Ethics Training

Most US government ethics training programs focus on avoiding conflicts of interest where an individual has an incentive to put personal interest before the public good. Examples of proscribed conduct include governmental actions by an official that result in improper economic benefit for that official or a closely related person or entity, the receipt of special favors or money in exchange for official actions, nepotism, and the use of public resources for personal benefit.

Fair process is also dealt with in government ethics training. In the United States, constitutional notions of "due process" include the premise that citizens are entitled to fair and unbiased decision-makers. Accordingly, bans on vote trading, discrimination, and unfair contracting practices are often covered.

As government officials work on behalf of the people, there is an ethical duty to keep the public informed. Topics concerning transparency, open meetings, public records, accountability, and financial disclosure laws are also frequently included in ethics training.

## The Training Process

Ethics training takes many forms. It can involve the publication of a code of conduct and/or an ethics manual, videos and interactive online courses, or in-person training. *See* NCSL.org for details of types of ethics training across the 50 US states. According to Robert Wechsler in his book *Local Government Ethics Programs*, most government ethics training involves a minimal class for new officials, a short annual class only for elected officials, or a simple online class or online materials. Wechsler criticizes these types of programs as "inexpensive attempts to make it look like there is a training program." He advocates in-person training as the most effective kind of training but cites obstacles such as expense, lack of training experts, and lack of perceived need as the reasons why government agencies do not engage in more in-depth live training (Wechsler 2013). Occasionally, special onetime in-person ethics training is conducted, even for entire state legislative bodies, in the wake of major scandals.

Because government ethics training sessions in the United States are generally of short duration, in the United States, most programs tend to focus on compliance with the ethics laws and regulations of the jurisdiction. Professor Mark Davies, former Executive Director of the New York City

Conflicts-of-Interest Board, has noted that compliance-based ethics programs are a predominant US approach wherein public servants are taught the explicit legal rules prohibiting defined conduct (Davies 2015). The value in this approach is that the public official or government worker is put on notice as to what conduct is illegal. However, the law cannot cover every scenario and often merely sets a minimum standard for ethical conduct.

Moreover, to maintain the public's trust in representative institutions, many public servants are charged with the duty to avoid even the appearance of impropriety. There may be conduct that walks the line between ethical and unethical behavior, is technically legal, but could compromise the public interest and destroy public trust. By focusing only on what is prohibited by law, strict compliance programs fail to address those areas where it is difficult to write compliance standards and where ethics and values rather than the law should inform public actions.

Another approach to ethics training is one centered around a government's value. Davies explains this approach as one where public officials are asked to "strive for and attain certain standards" (Davies 2015). Wechsler describes these types of standards as "regime values." He identifies regime values as those values that define the relationship between government and the people that are governed such as fairness, justice, openness, constitutional freedoms, political equality, civic responsibility, and citizen participation (Wechsler 2013). It is from these values that fiduciary duties of loyalty, fairness, competency, transparency, and accountability flow. The problem with ethics programs based only on general values is that they provide very little guidance to what is or is not specifically prohibited by law.

## The United Nations

In December 1996, the United Nations adopted the *International Code of Conduct for Public Officials* (*United Nations International Code of Conduct for Public Officials* 1997) The Code provides "A public office, as defined by national law, is a position of trust, implying a duty to act in the public interest. Therefore, the ultimate loyalty of public officials shall be to the public interests of their country as expressed through the democratic institutions of government" (*International Code of Conduct for Public Officials*, par. 1). The Code addresses conflicts of interest, disclosure of assets, acceptance of gifts and favors, confidential information, and political activity.

In 2003 the United Nations General Assembly adopted the *United Nations Convention against Corruption* (*United Nations Convention Against Corruption* 2003). There are 178 signatories to Convention. The Convention provides that each signatory shall:

> . . . promote education and training programmes to enable them to meet the requirements for the correct, honourable and proper performance of public functions and that provide them with specialized and appropriate training to enhance their awareness of the risks of corruption inherent in the performance of their functions. Such programmes may make reference to codes or standards of conduct in applicable areas. (*United Nations Convention Against Corruption*, Art. 7)

The United Nations Development Program (UNDP) works with nations to develop public sector training. For example, the UNDP in China is currently working with Chinese thought leaders to design anti-corruption training curriculum for Chinese civil servants (UNDP 2015).

For its own employees, the United Nations has a highly developed ethics program as well. In 2005 the Secretary General announced the establishment of the United Nations Ethics Office. According to the Ethics Office's web page, the objective of the office is to:

> . . .assist the Secretary-General in ensuring that all staff members observe and perform their functions consistent with the highest standards of integrity required by the Charter of the United Nations through fostering a culture of ethics, transparency and accountability. (http://www.un.org/en/ethics)

As of 2014 all employees of the United Nations itself are required to take an online course entitled *Ethics and Integrity at the United Nations*. All new staff members must complete the course within 3 months of their entry into service at the United Nations (http://www.un.org/en/ethics).

## Ethics Training in the United Kingdom, India, and China

### The United Kingdom

As a result of government scandals in the 1990s, the United Kingdom established the Committee on Standards for Public Life. Under the leadership of Lord Michael Nolan, the Committee identified seven principles to guide public conduct: selflessness, integrity, objectivity, accountability, openness, honesty, and leadership. According to the Committee, these principles "underpin much of the UK's public sector ethical infrastructure." The Nolan Committee advocated for ethics education as a way to promote and reinforce these principles of ethical conduct in public life (Committee on Standards in Public Life 2014).

The United Kingdom has developed a "Fast Stream" graduate education program to teach future leaders of the British Civil Service. In addition to field-specific training, Fast Stream participants receive mandatory training on the Civil Service Code that regulates their conduct. In-person and online training is available. More information is available from the Fast Stream website, https://www.gov.uk/government/organisations/civil-service-fast-stream.

Ethics training is available at induction for Members of Parliament through the Committee on Standards in Public Life. Attendance is not compulsory, and in the past induction training has not been well attended. In 2015, however, 93% of new Members of Parliament attended induction training (Bew 2015).

### India

India has a reputation in the world as a country where corruption in government is the norm. The Transparency International gave India a score of 76 out of 167 countries in its Corruption Perception Index for 2015 (Transparency International 2015). According to the Council on Foreign Relations, India has lost hundreds of billions of dollars as a result of corruption since its independence from Great Britain in 1947 (Xu 2014). The country is now attempting to make progress toward eradicating this problem. The Second Administrative Reforms Commission in its Tenth Report on Personnel Administration in 2008 articulated a need for a code of public service ethics that includes "integrity, impartiality, commitment to public service, open accountability, devotion to duty, and exemplary behavior" (Second Administrative Reforms Commission 2008).

One tool being implemented to help bring about a change in the ethical culture is training for the civil services. The Department of Personnel and Training oversees an elaborate training scheme which includes annual week-long educational programs. Classes in ethics and values in Government are offered as part of this annual training. According to India's National *Training Policy 2012*, the objective of training for civil service employees is "....to develop a professional, impartial and efficient civil service that is responsive to the needs of the citizens. In doing so, care will be taken to emphasize the development of proper ethics, commitment to work and empathy for the vulnerable sections..." (Department of Personnel and Training 2012).

### China

In 2015 China was ranked lower than India with a score of 83 in Transparency International's Corruption Perception Index (Transparency International 2015). However, in recent years China has been working on reversing this perception. In 2010 the Communist Party issued a legalistic Code of Ethics with 52 prohibitions for Party Members (Baijie 2010). The majority of public officials are party members. Chinese President Xi Jinping has been cracking down on corruption since he took office in 2012 (Oster 2014). In 2013 China issued its 2013–2017 anti-corruption plan which included a commitment to "deepen education on clean party conduct and governance" (Luan 2013). A translation of the plan can be found at http://chinalawtranslate.com/2013-2017-anti-corruption-plan/?lang=en. In 2015 the Communist Party promulgated a new Moral Code consisting of eight moral obligations applicable to all party members (Xinhua 2015). The government is officially encouraging the

public to rediscover Confucian teachings and values (Page 2015).

Since 2011 members of China's civil service have a mandatory obligation to complete 6 h of government ethics training (Huazhong 2011). The training is administered by the Training and Oversight Division of the State Administration of Civil Service Office established in 2008. The training consists of lectures and case studies to improve civil servants' loyalty to the people as well as improving their sense of responsibility and honesty. The training is conducted in each province (Huazhong 2011). For more information, see the Administration of Civil Service website at http://www.scs.gov.cn/nsjg/201408/t20140826_316.html.

### Other Countries

Ethics training programs for government officials are in place in many countries around the world. For a good overview of ethics training in Eastern Europe and Asia, for example, see the report, *Ethics Training for Public Officials*, published in 2013 by the Organization for Economic Cooperation and Development ("OECD"). This report documents the results of a study on ethics training in Eastern Europe and Asia conducted by the OECD Anti-corruption Network for Eastern Europe and Central Asia ("ACN") and Support for Improvement in Governance and Management ("SIGMA"), a joint initiative of the OECD and the European Union (Organization for Economic Co-operation and Development 2013).

## Recommendations for Creating an Effective Training Program

### An Effective Training Program Should Teach Both Ethics Values and Applicable Laws

Ideally, government ethics training programs should not only teach the ethics laws and regulations of a country, but should provide the practitioner with an understanding of the ethical values from which the laws were derived. Ethics laws and regulations are complex and not always intuitive. Public servants cannot become expert in these laws by reading a short manual or even attending a 2-h course. However, if practitioners have a basic understanding of their underlying ethical duties, they will have a better chance of identifying ethical dilemmas and be alerted to the necessity of seeking counsel if necessary.

### An Effective Training Program Should Provide Notice of Expectations

According to Davies, the first step in any ethics training program is for the government entity to create and circulate a value-based code of conduct which will inform public servants of what conduct is expected of them rather than just what is prohibited (Davies 2015). Professor Bob Stone at the Ukleja Center for Ethical Leadership (California State University in Long Beach) advocates for an ethics Code that is a non"legalese" statement of principles that is clear and short enough for public servants to understand and remember. He envisions a wallet-size card that will be passed out to all public servants, be they elected, appointed, or staff (Stone 2010). The more complex laws and regulations can be placed in an ethics manual.

### An Effective Training Program Should Inspire and Appeal to Individuals' Better Selves

Ethics training should inspire and serve to remind public actors that public service is a noble calling. Michael Josephson, President of the Josephson Institute, explains that one of the goals of ethics training should be to "create pride in public service that strengthens moral resolve and the commitment to high ethical standards" (Josephson 1989). Trainers should not focus all attention on what conduct is wrong, but rather should focus on what conduct is right.

Ethics education should underscore the importance of an ethics system in the government. Trainers should emphasize that ethical conduct maintains public trust in the integrity of government, that the public treasury is positively impacted by reducing litigation and enforcement costs associated with ethics violations, and that the ethical public servant benefits from enhanced reputation and standing in the community as well as the personal satisfaction that he or she is contributing to the well-being of the country.

### An Effective Training Program Should Provide In-Person Training

According to Wechsler, in-person ethics training is the most effective (Wechsler 2013). Gathering in a room with an ethics expert and similarly situated officials or government employees allows interaction and conversations about dilemmas that an individual might not have previously experienced.

In-person ethics classes can provide a forum that engages participants. A common criticism of ethics training programs is that classes are dry, boring sessions where students are forced to listen to a litany of ethics rules and regulations. Interactive case studies and discussions pertinent to an attendee's specific government role provide a much more relatable and memorable educational process. Role playing, trivia games, and use of examples from pop culture can help make the experience more interesting.

### An Effective Training Program Should Provide Introductory and Ongoing Guidance

Training should be part of the onboarding process for new government employees and should be conducted very shortly after a public official takes office. However, ethics education should not end when the ethics class is over. Agencies should promote a culture of ethics at all times. Davies suggests displaying posters and distributing brief ethics pamphlets will help remind public servants of their ethical obligations (Davies 2015). Agencies can highlight the praiseworthy ethical actions of individuals in newsletters and on websites. Public servants should be encouraged to seek guidance from legal counsel or ethics officers when specific ethical dilemmas come up. Ethics opinions, with confidential information redacted, can be shared to provide assistance to others who find themselves in similar situations. And finally, those leaving government service should be apprised of their continuing ethical obligations as they enter the private sector.

## Conclusion

The field of government ethics education is a developing one as more countries require public officials and civil service employees to participate in ethics training. States, provinces, counties, and municipalities are also requiring ethics education as are transnational organizations such as the United Nations.

Ethics training programs generally include such topics as conflicts of interest, duty of loyalty, gifts, disclosure requirements, transparency, anti-corruption policies, accountability, and fairness.

In order to be effective, training should be based on the relevant laws of the jurisdiction as well as the values of the culture. Training should be engaging. The best programs are in-person and interactive.

Civil service employees should receive training as soon as possible upon entering public service. Elected and appointed officials should receive training very soon after entering office. Ideally, training should be ongoing.

In the words of James Madison in *Federalist 57*:

> The aim of every political constitution is, or ought to be, first to obtain for rulers men who possess most wisdom to discern, and most virtue to pursue, the common good of the society; and in the next place, to take the most effectual precautions for keeping them virtuous whilst they continue to hold their public trust. (Madison 1788)

A well-designed ethics education program that is engaging and teaches both law and values will go a long way to assist public sector actors from fulfilling their ethical duties to the people that they serve. Public trust in government is essential for the health and prosperity of a nation. More ethics in government, and less scandal, will help assure that the public's trust is maintained.

# Ethinomics

Carole L. Jurkiewicz
McCormack College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Cost of ethics; Ethical culture; Ethics and finance; Ethics policy

## Definition

Ethinomics is a field of study that combines ethics and economics and that focuses on the organizational, societal, an individual costs and benefits of ethical and unethical behavior, inclusive of both macro- and microlevels.

## Introduction

Ethinomics is a relatively new area of study that focuses on the costs of ethical and unethical behavior for individuals, organizations, and societies. The presumption is that ethics is a rational choice, and research in this attempts to assess as objectively as possible the ramifications of making these choices. Such choices can include ones of commission or omission, and their effects may be short and/or long term. Microethinomics focuses on costs only to the individual and those in their immediate sphere of influence. Macroethinomics has a broader focus, assessing the impacts of individual ethical decisions on organizations and society as a whole. The study of ethinomics has been adapted by legal scholars to address the ethical impacts of legal decisions in establishing precedents and shaping societal changes.

## Overview

Ideally, organizations would demonstrate ethical behaviors simply because it is the right thing to do. Yet research shows that they are reluctant to expend time and resources on activities that do not show promise of financial return. This focus on return on investment has spurred the field of study known as ethinomics to provide an overview of the costs and benefits of creating and maintaining and ethical culture.

The costs associated with ethicality, while in part ephemeral, can be objectively demonstrated for organizations. These usually include the costs of legal compliance, ethics audits, ethics training and assessment, employing an ethics officer, conducting ethical risk assessments and reporting results, developing ethics codes, sponsoring external oversight visits, whistleblowing mechanisms, enforcing ethical standards, foregoing shortcuts that violate ethical standards but result in short-term competitive advantage, and paying more for products and services that have verified levels of ethicality. Research asserts that while there are costs associated with ethicality, the costs of unethical organizational behavior is much higher and longer lasting and impacts not only the organization itself but also individuals and society in general.

Organizational corruption, viewed as public administrators and politicians seeking personal over public good, and violating standards of the public ethic such as being motivated by service, equality, fairness, and altruism, diminishes the credibility of public institutions in conducting government business, dealing with the public, collecting taxes, and sullying the public ethic. Behaviors of those seeking self-advantage over the public good include preferential contracting, nepotism, bribery, embezzlement, and using public personnel and funds for campaigning efforts. Further, policies supporting segregation, discrimination, sexual harassment, failing to protect battered women and children, crime victims, or those who are bullied are also viewed as professional neglect. Such practices have been linked to declines in well-being, resulting in physical, psychological, and behavioral costs such as smoking, drug and alcohol abuse, somatization and anxiety, cardiovascular problems, mental health issues, and sleep disorders. In corrupt organizations, employees and

citizens can feel isolation and physical and verbal intimidation, depression, stress, anxiety, suicidal thoughts, and diminished self-esteem. Employee absenteeism, sick days, trauma, stress-induced illnesses, extreme fatigue, and retaliatory crimes are additional costs of organizational lack of ethicality. Additional costs include depressed economic development due to mistrust of government, environmental damage, increased errors in judicial oversight, and contagious effects seen in increased unethical behavior on the part of citizens and other organizational sectors. Research has clearly indicated a correlation between high scores on the Well-Being Index and those local and state governments that score low on the corruption scale; the converse is also true (Jurkiewicz and Morozov 2012).

Corruption damages the public realm and reduces the ability of public institutions to get the job of government done. Given the incidence of narcissism has increased at a rapid rate (Twenge et al. 2008), the use of ethical reasoning to rationalize self-serving actions at the expense of citizen welfare is increasingly being witnessed in the public sector. This increase of corruptive acts diminishes citizen trust, in turn reducing the ability of government to function effectively undercuts the economic stability of the nation.

## Advantages of Being Ethical

Having detailed the costs of unethical behavior, we now turn to the measurable benefits of ethicality. These include increases in efficiency and productivity and increased trust, morale, productivity, and efficiency. These strengths bolster the financial stability of organizations and increase the likelihood that they will receive grants, reduced loan rates, and higher bond rankings. Ethical behaviors also enhance the reputation of the organization with citizens, vendors, and proprietary and nonprofit businesses and facilitates the hiring and retention of qualified and capable employees. As public/private partnerships continue to grow, ethicality confers a competitive advantage and bolsters building long-term win-win relationships.

Further benefits of acting ethically are developing and maintaining credibility and believability, building perceptions of caring, trust, fairness, responsibility, and respect. Federal, state, and local government bodies are being increasingly subjected to screening policies to ensure human rights are being respected, labor standards are followed, anticorruption policies are enforced, and environment impact measures show adherence to protocols. Governmental bodies that fail to score well on these measures find fewer opportunities for collaboration, receive higher bids from vendors, and open themselves to litigation.

Table 1, below, details key indicators of ethicality as expressed through organizational practices. The list can be used as an assessment tool, a pre- and postanalysis of ethical interventions,

**Ethinomics, Table 1** Key indicators of ethicality as expressed through organizational practices

| |
|---|
| Addresses ethical dilemmas, actual or chosen from other sources, regularly in meetings and correspondence as a foundation to discuss correct ethical decision-making |
| All employees are held to the same standards of moral conduct regardless of their position, and there is an absence of favoritism or nepotism |
| Citizen and employee feedback articulates that they feel they are treated respectfully and valued |
| Communication is straight-forward and employees/citizens feel honestly informed, gossip and rumor are minimal |
| Demonstrates through policies and programs the values the organization espouses |
| Employees feel empowered and supported |
| Exhibits a culture of trust and commitment |
| Implements systems to prevent or minimize harmful behaviors |
| Low employee turnover and absenteeism, many qualified applicants for advertised positions |
| Meets or exceeds legal requirements |
| Openly transparent in policy and practice |
| Resources and opportunities are distributed equitably, inside and outside the organization |
| Respects and encourages diverse opinions and viewpoints |
| Responds to claims of wrong-doing with respect, in a timely manner, and with transparency |
| Rewards ethical behavior |
| Training, promotions, and awards tied to ethical performance |

and/or a rubric for creating ethical codes and ethical training programs.

## Conclusion

The ethical proficiency of public administrators and politicians is evidenced in the decisions, policies, and practices they directly influence. At one end of the ethical continuum are satisficing decisions made on the basis of expediency and short-term gains; at the other end are decisions focused on long-term outcomes, accounting for a broad spectrum of affected parties, consideration given to the potential consequences of their decisions, and striving to find the best possible solution for everyone. Emotional intelligence, adaptability, tolerance of divergent opinions, and the extent to which political gamesmanship is absent from decision-making are additional measures of ethical competency. The degree of transparency and the level of organizational commitment by employees are key factors, as are the organization's reputation for trustworthiness, the effective resolution of complaints, and the confidence demonstrated in the organization and its leadership by citizens and other parties. Measuring these factors can help in determining whether to elect, re-elect, or appoint individuals to positions of influence. Such measures offer a more objective assessment of leaders' propensity to engage in self-serving behaviors at the expense of the public good. As reports of unethical behavior increase, and concern over both how to correct the problems and establish accountability grows, the field of ethinomics has expanded rapidly in response. The overview reported here provides some background and a foundation for further inquiry.

It has become obvious, except to those who attain personal and political advantage through these means, that effectively managed government regulatory agencies are essential for a thriving and healthy economy. If these agencies, on which tens of billions of dollars a year are spent, were celebrated for the essential role they play in upholding ethical standards, there would have been no financial collapse and no public disgraces that made AIG and Madoff household names. Political maneuvering for personal gains have stripped the regulatory agencies of their integrity, disparaged their purpose, and made them an icon of parasitic big government. It is still possible to restore the dignity and vitality of government and, in so doing, that of the other sectors. It is simple ethinomics.

## Synonyms

Ethnic exclusion; Ethnic inequality; Ethnic marginalization; Ethnic power relation

## Definition

Ethnic political inequality is showing the level of access of ethnic group into executive branch.

## Introduction

Sudan is a multiethnic country, and identity has played role in shaping the competitive vision of North versus South of Sudan (Deng 2011). According to Harir (1994), although Darfur had been the last province to become under British domination, it was also passed on through the "Sudanization" process to the elites from the North; Harir called these elites "riverine." Soon similar sentiments to those in the South Sudan became prevalent in Darfur due to the wide exclusion of the Darfurians from administrative and military positions in the newly independent Sudan (Flint and de Waal (2006); Harir 1994). Among other factors, ethnic inequalities contributed to the civil wars that persist today. All armed movements or political parties, throughout their struggles, have advanced demands for power-sharing with the central government as regional political actors. They have demanded economic development for their regions, as well as some level of autonomy. However, that struggle was associated with costs, including the destruction of infrastructure, the direct military spending attributable to the war effort, and the impact of the latter on reducing a capital formation and economic destruction. The presence of conflict has created economic and political inequalities, because the conflicts have negatively affected the conditions in the conflict areas. For example, from 2004 to 2009, in addition to the human destruction, the government of Sudan has incurred war costs totaling US$30.5 billion (Ali 2013).

The ethnic groups advanced regional issues such as economic and political marginalization to mobilize against the agenda of the central government rather than pressing for specific ethnic group demands. This is clearly reflected in the creation of regional political parties and armed movements composed of different ethnic groups to demand power-sharing with the central government along regional lines.

The purpose of this analysis is to identify the regional imbalances in political power sharing and the relative shares of ethnic groups in the executive branch. In addition, the regional analysis will help to identify leadership legitimacy and institutional building. The cases analyzed in this study will allow academics and policymakers to provide policy recommendations to rectify the historical marginalization of specific regions by facilitating discussion on resource allocation across different regions in the country, as well as on how to remedy issues of historical marginalization.

The organization of the paper is as follows. Section "Data" presents the data. Section "The Case of Sudan" describes the ethnic distribution of political representation in central government. Section "The Case of South Sudan" presents a case of ethnic mobilization in South Sudan that led to secession. Section "Leadership Legitimacy and Institution Building" discusses leadership legitimacy and institutional building. Finally, we provide some concluding remarks.

## Data

The Ethnic Power Relations identifies politically relevant ethnic groups, defined as groups that are politically represented by at least one organization at the national level (Vogt and Cederman 2014), and it reflects the ethnic mobilization and power dynamics. However, in Sudan and South Sudan before the secession, the relevant ethnic groups have learned that the best strategy to advance their interests, avoid marginalization, and get access to the government's patronage system is through building multiethnic political coalitions at the regional and national levels. In regions with demographically dominant ethnic groups, the central government can mobilize the peripheral ethnic groups through its system of patronage to create inter-group rivalry and divisions. Given the histories of Sudan and South Sudan, this paper introduces an alternative view of the political and economic power distribution in these two countries, using a regional analysis, i.e., treating the ethnic groups that belongs to one region as one unit and what level of access they have it at the national executive power. Until 1999, the scholarly literature divided Sudan into the Eastern, Northern, Central, Southern, and Western regions. Using secondary data from various sources, mainly the *Black Book*, El-Tom (2003) these regions' access to national executive power can be assessed based on the percentage of their ministerial positions. Time periods are marked by changes in the head of state.

## The Case of Sudan

Excluding the ethnic groups from South Sudan, throughout Sudan's history before the secession, there have been many instances in which regional affiliation played a more important role than ethnic identity. South Sudan was viewed from lens of ethnicity by Northerners with political and economic marginalization that have compounded their status to be second-class citizens. However, the other regions such as Darfur, Kordofan, and Eastern Sudan, where the regional identities were, matter. These identities later facilitated the formation of armed and political movements to confront the central government. For example, despite political protests of Darfuris against the central government, the first spark of the armed conflict in Darfur was lit on 26 February 2003, when a rebel group attacked the military garrison at the town of Golu in East Jebel Marra. The rebels' political manifesto and agenda were perceived as a regional protest against economic marginalization (Ali 2013). The rebels demanded increased economic development and the creation of employment opportunities in Darfur. The main rebel movement, the Justice and Equality Movement, is an armed group founded by Khalil Ibrahim, in existence from 2000. It called for equal power and wealth sharing across all regions in Sudan. The Sudan Liberation Army is composed of the major ethnic groups in Darfur, including the Zagahwa, Fur, Berti, and Massalite groups of African origin, as well as some Arab tribes. It is clear that the rebel demands are all about economic development and power-sharing in the central government in the interest of the region. While the Ethnic Power Relations data focus on ethnic groups' access to power in the executive body, in reality, individuals were appointed to the government based on their political parties' agreement with other parties in power. Thus, the ethnic identity of the main political actors was a sufficient but not a necessary criterion in the distribution of power across ethnic lines.

In addition, Eastern Sudan, there are regional parties, such as the Beja Conference and the Eastern Front, both of which have made demands for regional power-sharing and economic development in Eastern Sudan. Similar regional power-sharing demands were advanced by political entities in the Nuba Mountains, including the General Union of the Nuba Mountains in 1965; the Sudan Rural Solidarity Front, which brought together people from Blue Nile, Darfur, and Beja; the Sudan National Party in 1986; and the Free Sudan National Party in 2002, all of which have called for the self-determination of the Nuba people. The All Nuba Conference held in Kauda in 2002 included the Free Sudan National Party, the Sudan National Party-Collective Leadership, the

Sudan National Party, and the General Union of the Nuba Mountains. As a result of this meeting, these parties agreed to dissolve themselves as parties and merge into a new party called the United Sudan National Party. This coalition did not survive due to the general political environment and the competition among the leadership within the the *Sudan People's Liberation Army* that was founded as a guerrilla movement in 1983 and was a key participant in the Second Sudanese Civil War. Throughout the war, it was led by John Garang. Later, the *Sudan People's Liberation Army* became the dominant armed movement that represented the interests of the Nuba and South Kordofan. The organizational evolution of these political actors shows that they have focused more on regional grievances, rather than ethnic group demands.

Using data from the *Black Book*, we applied a relatively simple scale to determine a region's access to executive power (Table 1).

The different ethnic groups were grouped according to region, as follows:

| Ethnic groups | Region |
|---|---|
| Shaygiyya, Ja'aliyyin, and Danagla | *Northern* |
| Beja and Rashaida | *Eastern* |
| Nuba and Fur | *Central* |
| Masalit, Fur and Zaghawa, Nuba | *Western* |
| Bari, Latoka, Shilluk, Dinka, and Other Southern groups | *Southern* |

Table 2 summarizes the power status of each region over time.

The regional analysis also suggests that, in a few instances, some regions were politically discriminated against. In these instances, they had no representatives at the level of ministerial positions.

**Ethnic Power Versus Regional Power Relations: The Case of Sudan and South Sudan, Table 1** Regional analysis

| Share of ministerial positions | Status designation |
|---|---|
| 100% | *Monopoly* |
| 100% > X > 50% | *Dominant* |
| 50% > X > 30% | *Senior partner* |
| 30% > X > 20% | *Junior partner* |
| 20% > X > 0% | *Powerless* |
| 0% | *Discriminated* |

## The Case of South Sudan

Before the secession, in South Sudan, the first civil war occurred from 1955 to 1972, led by Anyanya I and II, with the aims of achieving political representation at the level of the central government and more regional autonomy for the country's south. From 1969, the Nuer, Lotuko, Madi, Bari, Acholi, Zande, Dinka, and other ethnic groups from the Southern region of Sudan waged war against the central government. Later, under the umbrella of the Sudan People's Liberation Army, they achieved the objectives of secession and the formation of an independent state in South Sudan. The organizational evolution of the rebel movement again shows that the ethnic identities and the quest for ethnic group access to power at executive levels were less important than a common regional agenda for an autonomy. Ethnic group leaders realized that it was not in their interest to advance narrow ethnic or tribal political interests if a joint regional political vision might pave the way to gaining full control of South Sudan. Indeed, the Naivasha Agreement in 2005 between Sudan government and Sudan's People Liberation Army paved the way for secession of South to be a republic in 2011. However, in 2015, this regional vision disappeared, and ethnic interest resurfaced, resulting in a civil war along ethnic lines. The society has fragmented. In fragmented societies, the dominant ethnic group tends to forge coalitions to mitigate inter-ethnic conflict. It appears that the ethnic fragmentation in South Sudan is too deep. The political leadership played ethnic politics, and war crimes were committed, raising questions of leadership legitimacy and institutional capacity to mitigate the intensity of the conflict.

## Leadership Legitimacy and Institution Building

Legitimacy of the leadership in Sudan has been questionable since independence, except in 1964 and 1985–1989. Military rule in 1958, 1969, and 1989 gave rise to confrontational relations

**Ethnic Power Versus Regional Power Relations: The Case of Sudan and South Sudan, Table 2** Power status by regions

| Period | MPS | Northern | Eastern | Central | Western | Southern |
|---|---|---|---|---|---|---|
| 1954–1964 | 73 | *Dominant (79.5%)* | *Powerless (1.4%)* | *Powerless (2.7%)* | *Discriminated (0%)* | *Powerless (16.4%)* |
| 1964–1969 | 81 | *Dominant (67.9%)* | *Powerless (2.5%)* | *Powerless (6.2%)* | *Powerless (6.2%)* | *Powerless (17.3%)* |
| 1969–1985 | 115 | *Dominant (68.7%)* | *Powerless (3.5%)* | *Powerless (16.5%)* | *Powerless (3.5%)* | *Powerless (7.8%)* |
| 1985–1986 | 30 | *Dominant (70%)* | *Discriminated (0%)* | *Powerless (10.0%)* | *Powerless (3.3%)* | *Powerless (16.7%)* |
| 1986–1989 | 116 | *Senior partner (47.4%)* | *Powerless (2.6%)* | *Powerless (14.7%)* | *Junior partner (24.4%)* | *Powerless (12.9%)* |
| 1989–1999 | 202 | *Dominant (59.4%)* | *Powerless (3.0%)* | *Powerless (8.9%)* | *Powerless (13.9%)* | *Powerless (14.9%)* |

The numbers in parentheses show the share of ministerial positions held by a given region
*MPS* Ministerial positions

between civil authorities and the military. In 1958 the military officers were less ideological and more focused on development issues, but their rule created the conditions for confrontation with South Sudan. They represented the core of the riverine elites, who have governed Sudan since its independence. They are mostly from Northern Sudan, including Shaygiyya, Ja'aliyyin, and Danagla who laid the groundwork for the continuation of the colonial legacy, whereby the center governs the peripheries. The popular uprising of 1964 ended in military rule. However, previous policy continued, and the riverine elites amassed power at the expense of the peripheries. The merchants, along with the center-driven political parties with feudalistic orientations, continued exploiting the state's treasures and created opportunities to enrich themselves, until another coup was staged by a group of Free Officers in May 1969. The Free Officers were ideologues of Pan-Arabist and socialist orientation. They introduced major economic and political changes that further damaged the socioeconomic fabric.

There was a brief lull in the conflict with South credit to the 1972 agreement between North and South. Known as the Addis Ababa Accord, it was a set of compromises within a 1972 treaty that ended the First Sudanese Civil War (1955–1972). The Addis Ababa Accords were incorporated in the Constitution of Sudan (Collins 1991). However, in 1983 conflict erupted as the ruling regime started to undo major articles of the Addis Ababa Accord. Acts of civil disobedience led to a popular uprising in 1985, which overthrew the regime and paved the way for a democratic government that did not last more than 2 years. The 1989 coup, led by a military junta, perpetuated the conflict with South Sudan and the Darfur region. War crimes were committed, resulting in the indictment of the president of Sudan by the International Criminal Court (ICC).

Since the 1989 coup, the Sudanese people have been yearning for democracy and looking for political change. However, in all this time, the government has failed to establish its legitimacy. The current political discourse among the elites is moving beyond regime change to seek even deeper changes in the role of the state and a new social contract for a developmental state. This trend is leading the country to build institutions with a true capacity to govern and to successful succession mechanisms for leadership.

Furthermore, the bureaucratic state needs a major restructuring. On the eve of independence, the British left a reasonable bureaucratic system with good internal and external controls. The civil service was monopolized by the riverine (Shaygiyya, Ja'aliyyin, and Danagla) tribes. There was clear separation of power. However,

the colonial system was more interested in centralized government, while what the country actually needed was a federal system of government. The country is vast and diverse ethnically and multicultural, hard to govern from the center. Regions such as Darfur and South Sudan, which are distinctly different entities, were annexed by coercion. For more than six decades, the tension between the center and peripheries continued. This tension has created instability and weakened the existing institutions. It opens the door for military intervention under the pretext of preserving national unity. The political parties are also centralized and controlled by political feudalists who built a patronage system and demand personal loyalty. Consequently, political representation and role of civil society were diminished. A feeling of national identity has never been promoted, and collective action toward an inclusive social contract has never materialized. Since 1989, state institutions have been replaced by political oligarchies and kleptocracies. The political parties themselves have disintegrated: at present, there are more than 100 political parties and 24 armed movements. The ethnic groups from the peripheries were mobilized to confront their marginalization and exclusion. They follow different paths toward their struggles. There is a need for a national consensus to restore peace, restoration of civil society institutions, and agreement on how to govern.

## Conclusion

One of the weaknesses of Sudan's regional is that it obscures the power balance between ethnic groups within the same region. This may be particularly relevant, for instance, when a single ethnic group controls political power by itself in a region where, as a whole, it can be considered "dominant" ethnic group. In such cases, the ethnically based analytical framework is better placed to capture such within-region power imbalances by focusing on the actual ethnic groups.

However, studying regional inequalities helps us to better understand the processes that preceded the onset of conflicts in Sudan, especially the regional inequalities in the level of economic development. These inequalities can be thought of as early triggers that lead to the aggravation of horizontal inequalities and polarization between ethnic groups within regions. In fact, one could argue that interregional inequalities are the base determinants of inter-group inequalities. In addition, the arguments regarding collective grievances also apply to regional groups, not only to ethnic identities. Finally, separatist movements are often the result of regional rather than ethnic inequalities.

It is vital to carry out measures to raise political awareness and promote a culture of unity, understanding, and good governance. In a society with fewer dominant ethnic groups, the regional inequality can be corrected in the long run by setting up proper institutions at the regional. Finally, the access of ethnic group leaders to political power tends to be short-lived and without any lasting impact, as ethnic group representatives usually enter and then soon exit the political system.

# Ethnicity in the Caribbean

John Gaffar La Guerre
Department of Political Science, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Customs and class; Diversity; Race

## Definition

Society is a collection of people.

Ethnicity is the state as belonging to a social group.

## Introduction

### Ethnicity – A Global Perspective

Society is a collection of interacting groups. Each has its own interest however different. Indeed, groups emerge the better to achieve security and the pursuit of its interest however interpreted. In this way, "we" and "they" conceptions as well as that of "the other" emerge. It is not surprising then that the idea of an ethnic group should also have developed. Unlike a trade union, an employers association, or a political party, an ethnic group is one that is based on a coming together of a number of attributes which a designated set of people possess, namely, common descent, territorial location at a point in time, some common physical features, a common language, and shared culture. They are also perceived by others to be different. For these reasons, ethnic groups are equated with kinship groups. It is thus not surprising that such groups should have a close relationship with the state (Horowitz 1985).

The migrations of groups from one territory to another, the establishment of empires, whether British, French, Spanish, Soviet, or Ottoman, and their dissolution along with the discovery of the Americas and two world wars brought groups not only in greater contact with one another but also in competition. The collective legacy was a history of ethnic conflict followed at times by periods of peace or truce. More recently, there have been eruptions of one kind or another – in former Yugoslavia with claims of ethnic cleansing in the Balkans and Caucasus, Northern Ireland, Ethiopia, Indonesia, Rwanda, Bosnia, Canada, Pakistan, Burundi, and in several regions of Latin America. The causes in each case vary to some extent, but according to Gurr (1993) they all involve the allocation of power and the distribution of resources and in many ways the public administration of the state.

A major cause is of course the size of the group in question and its power prospects. Where a group is small in size and power is determined by the ballot, that group will lack much leverage and will be reduced to alliances or coalition with larger groups. Dramatic social or political change also changes the prospects of some groups, enhancing the prospects of some and limiting the prospects of others. Different conquerors brought differing policies, for example, the British and French had differing conceptions of empire. Whereas the British wanted merely to lead their people to self-government, the French felt that they had a "mission unvilatrice." Differing empires, for example, the Czarist as against the Ottoman, used different policies and administrative arrangements in relation to groups. World wars like the first and second also involved the relocation and shuffling of different groups leading at times to Diasporas and transformations from majority to minority status under differing social and political orders as happened with Soviet – citizens in the former USSR (Smith 1981).

In the British Caribbean, the white, ethnic group is no longer a powerful political force, while in the French Caribbean they are regarded as "a dominant minority." While it is true that the usual boundary markers which separated ethnic groups such as color, hair, and eyes have been eroded by the advances of technology according to Hartick (1979), there are still some rough indices such as shape of head, accent, dress which are used to distinguish Nordic from Slavic,

Gasbartier, and others just as is done in the United States and elsewhere in terms of "black" and white.

Given the experiences earlier indicated, it is not surprising that memories are an important ingredient of ethnic grievances. In Northern Ireland, Scotland, and Wales, among Croats, Muslims, and Serbs in Eastern Europe; in Latin America in the treatment of indigenous people; as well as in Germany and Poland, prior injustices provide the oxygen which keeps ethnic tensions alive. Whether the grievances or the cultures or racial characteristics are "invented" or not, they do provide the bonding by which group activity or conflict is sustained.

Added to these is the role of galloping globalization, modernization, and democratization as well as the redrawing of boundaries that have taken place over the last decades of the twentieth century. The digital age has ensured that Diasporas can keep in touch and sustain action, while the globalization of the drug trade makes it easier for narco-elites to champion groups and causes in pursuit of their interests especially where irredentist groups and mineral resources are involved. What drives the group however is the perception of discrimination and the lack of power in relation to other groups. Various policies at national and international levels have been employed to contain, prevent, or lessen ethnic conflict. Understandably the policies would vary with country and causes. For these reasons, administrative arrangements will normally differ depending on the nature of the state and the causes of conflict (Linz 1990).

In Northern Ireland, although both Protestants and Catholics the main antagonists are white, it is clear that memories, religion, and the state of internal security are major factors in group tensions. For this reason, according McGarry and O'Leary (1993) power sharing at the executive level has been employed to distribute power and resources more evenly at both state and administrative levels. Attention is also being directed at the police and military. While power sharing is a device aimed largely at the executive, it should be recognized that it must also address the question of how the fruits of such power are distributed. In such a case, the sharing should not be restricted and should apply to other sectors of the state. For these reasons, appointments to state agencies are becoming more representative (Lijphart 2008).

It is also important to recognize that some policies may have unintended consequences since in ethnic policy, in particular, it is difficult to decide where cause and effect begins. To contain irredentist conflict, some policy-makers for instance allow some measure of decentralization at administrative levels, but this is sometimes perceived as a sign of weakness, and the action may provoke further protest that lends to independence. For these reasons, programs of decentralization, autonomy whether cultural or political, should be handled with extreme care, and devices such as the veto should be placed at critical points (Montville 1990). It is also important that appointments to state positions at the higher levels should straddle ethnic groupings. Unitary political systems are usually the norm for countries of moderate size, but some kind of federal system is preferable for large countries. Thus, both Nigerian and the United States use federal systems, but a lot depends on the kinds of power that are divided between the center and the periphery. The center usually retains control over monetary policy, communication, the military, defense, and foreign policy. Even here however it is important to decentralize in order to ensure ethnic support (Brown 1993).

As with devolution and decentralization, the degree of concession to the periphery is important, even if it is partly at the level of administration. A confederation is a much looser version of federation that allows considerable power to the units as the example of the Civil War of 1861 in the United States aptly illustrates. Electoral systems, as Young (1999) notes, and the nature of constituencies are important devices used to contain ethnic conflict. The two most touted proposals have been the first-past-the-post or simple majority systems and the various versions of the proportional representation. A simple majority system for single-member constituencies has been largely used in parliamentary systems and tends to encourage compromise between the groups and moderation in public policies. It also

ensures a closer relationship between the constituency and the legislature. Generally however the administrative agencies involved in their implementation have been sources of ethnic controversy (Shugart and Carey 1993).

The prime minister is selected from the legislative chamber and is directly elected by it and answerable to it. In pure presidential systems, the president is elected by a separate vote and is not answerable to the legislature. He also appoints his own executive largely from outside. It is virtually impossible to recall him. Under a system of PR, however, voters are attracted as groups and in this way helps to keep group sentiments alive. Coalition governments are also widely associated with PR and with potential instability. A lot depends on whether groups are forced to build alliances and coalitions across groups and states as obtains in Nigeria. What is also important is whether all groups get a fair piece of the fruits of power.

It is instructive to note also that no country has moved from presidentalism to a parliamentary system. Reforms such as a collective presidency and rotating offices have been tried in Yugoslavia. More recently, states have been expanding the sharing of power by means of cultural councils, local government initiatives, assimilation, race relations, and equal opportunity commissions, and affirmative action schemes or multicultural devices have been introduced in a number of countries such as the United States and elsewhere along with preferential policies with regard to housing and cultural initiatives. These management initiatives have however encountered criticism for what is perceived as "reverse racism" and perpetuating a dependency syndrome (Glazer and Moynihan 1995).

Increasingly also, international organizations are becoming more involved in monitoring conflicts internationally as well as the policies adopted in relation to national election, human rights, and freedoms. In this regard, the intervention of the United Nations in the Balkan wars was critical even if it came a little too late as the massacres of Srebrenica clearly indicated. It has also been suggested that individual country interest does not always coincide with another's interest. Not all states can be neutral. Bureaucracies can also hinder the effectiveness of international action. It is clear then that ethnic policies can only go so far. Ethnic peace and tolerance are for perhaps one generation. Succeeding generations will have their own aspirations. Schools, the media, as well as social and political elites will all have to play a role in promoting racial harmony and tolerance since what is required is a whole process of resocialization of all elites, including the administrative elites (Oakley 2003).

In the case of the Caribbean and to some extent much as in Europe, the societies were the products of settlement, migrations from diverse countries, conquests, and plantation economies based on slavery or some degree of forced labor. To some extent in various countries, there was a measure of ethnic cleansing. Accordingly, it is not surprising that past memories of injustice, diasporic connections, and irredentist initiatives often emerge. For these reasons, there have been long-standing interest and at times involvement in the ethnic struggles of African-Americans in the United States as well as strong links between the Indian communities in the Caribbean and India and Pakistan as well as a concern with developments in Europe on the part of the whites. What is clear however is that these external pulls have been receding with changing generations.

What is also clear is that the demographic ratios of the various ethnic groups have been a major factor in the extent of conflict between and among them. For this reason, administrative techniques and arrangements have to change to cope with the new reality. Jamaican society is largely African-descended, and although one hears about the plight of the "black man," the divisions more often follow "class" lines, although there have been some outbursts against the Chinese community. The last few decades have been largely peaceful. The policies adopted by the state have been largely assimilationist with some concession to the cultural preoccupations of the Rastafarian community. Much of the ethnic assertions over the years have also been imported from the nearby United States.

In the case of Barbados, there has been a measure of self-government since 1640, the dominant ethnic group being African-descended, while

African-descended politicians have been dominant for a long time, although the whites continue to sustain their supremacy in the economy. There are however frequent expressions of anti-Indian sentiment, given their high visibility in the more visible sections of the economy, such as retail establishments. The policies followed by the state are largely assimilationist and was one of the few countries to escape the visitation of "Black Power" during the late 1960s and early 1970s.

La Guerre and Bissessar (2013) notes that in Trinidad and Guyana, by contrast race relations have been a source of conflict for some time. The Indians in Trinidad make up a sizeable section of the community, are different in culture from the African community, and are largely concentrated in the central and southern areas of the country. The Indians dominate in the agricultural sector, while the African is to be found largely in the urban areas and public services. The African-descended community has dominated the politics for quite some time, but with the emergence of a mixed group, Indians on the basis of coalition have been able to capture political power in 1986, 1995, 2000, and 2010. Trinidad is however a small country and intergroup interaction is strong. The ethnic division of labor is changing, while the state embarks on policies of assimilation and concession to cultural differences.

In Guyana, by contrast, there is the problem of size which encourages residential segregation and discourages intergroup interaction. The Indians comprise a dominant majority, while the African-descended groups seem doomed to be a permanent minority. Under a Westminster model with a first-past-the-post system, they would have been condemned to perpetual opposition. In addition, the constitution was suspended in 1953 due to Cold War complications and proportional representation introduced in 1964 that stimulated not only heightened ethnic tensions but mass killings. Proportional representation conferred power on the African community until 1992 when under a reformed system an Indian leader was returned to power. Clearly the major issue was a system that would give each group a fair chance at achieving power.

In 1970, a republic was introduced and in subsequent years other constitutional and electoral changes that allowed an African leader, on the basis of a coalition to achieve power. Not surprisingly in both Guyana and in Trinidad, race relations commissions have been introduced to monitor and contain ethnic conflicts. Recently, however there have been calls for reparations coming from Barbados in particular but now being advanced by CARICOM. Who gets the reparations and who must pay are of course crucial issues but what is expected is that it would be seen as a gesture of apology for past injustices such as slavery, genocide, indentureship, and the thievery of indigenous lands.

## Conclusion

In ethnic conflict, political solutions are crucial, but as we have seen, the administrative arrangements to translate them are just as important. For this reason, the appointments to key institutions, the personnel administration, the administrative devices used to allocate funds, the composition of the public services, and the institutions to vehicle one can appeal these and more are the crucial ingredients of ethnic arrangements.

# Ethnoracial Politics

Andrew L. Aoki
Augsburg College, Minneapolis, MN, USA

## Synonyms

Minority politics; Racial and ethnic politics

## Definition

Ethnoracial politics refers to politics involving categories that include African Americans, American Indians and Alaska Natives, Asian Americans, Hispanics, and Native Hawaiians and Pacific Islanders. Collectively, these groups are sometimes referred to as "people of color," while most of the rest of the American population could then be labeled "non-Hispanic White." However, the difference is in the eye of the beholder, and differential treatment can emerge for many reasons, so even those classified as non-Hispanic White may find themselves fighting for equal treatment or opportunity. In the early twenty-first century, the best examples of this have been the people from the Middle East and Muslims.

## Introduction

Ethnoracial politics is about difference and the struggle for equality. For populations that have been deemed fundamentally different, there have been long battles for equal treatment and opportunity.

The key characteristic of ethnoracial politics is marginalization of a population. At different times in American history, categories of people have found themselves the target of efforts to reduce their chances for economic, political, and social opportunities. Because of this, ethnoracial politics tends to involve issues such as political and economic equality, political incorporation, sovereignty, and immigration.

The term *ethnoracial* – rather than just *racial* – grows out of the fact that the US Office of Management and Budget defines "Hispanic" as an ethnic label, not a racial one, although this could change by the 2020 census. So, to make it clear that we are referring to the politics of all five groups noted above, scholars have increasingly taken to using the term *ethnoracial politics*.

## Social and Economic Equality

The quest for social and economic equality is one of the oldest concerns in ethnoracial politics. Africans resisted their enslavement in colonial America, although the extent of legal and societal discrimination made formal political opposition extremely difficult. Over the next century, Mexicans and Asian immigrants also found themselves fighting for equal rights in America, and, as the lands of indigenous peoples were swallowed up by the United States, native peoples also struggled for equal treatment.

African American activists often led the way, enduring imprisonment, torture, and deadly violence. By the mid-twentieth century, they began to achieve landmark victories, such as the *Brown v. Board of Education* (1954) Supreme Court decision, which found government-mandated segregation of schools unconstitutional. The next decade, Congress passed the Civil Rights Act of 1964, which outlawed discrimination in a wide variety of circumstances, including employment and business that served the public, and the Voting

Rights Act of 1965, which empowered the federal government to act against states that sought to prevent Blacks from voting.

Today, much of the focus has shifted to educational and economic concerns. The battle for equal treatment is by no means over, but the past half century has shown that reducing openly discriminatory treatment does not guarantee equal opportunity or equal outcomes. Widespread disparities between ethnoracial groups continue to be found in schooling, housing, employment, wealth, and poverty. African American activists have often been joined by Hispanics in the push for policies which might reduce these disparities. Many Asian American groups have also supported these efforts, but a much smaller percentage of Asian Americans are disadvantaged in these ways.

American Indian groups have also joined these coalitions, although native activists often place their greatest emphasis on other issues. In addition, American Indians and other indigenous groups sometimes are in the unique situation of controlling territory – often referred to as *reservations* for American Indians. American Indian reservation leaders often place more emphasis on economic development or access to natural resources. And so, while greater educational opportunity or job training is important to them as well, there have also been battles over control of business opportunities, most notably gambling casinos, although by no means limited to them. Casinos have rarely been a source of wealth for Indian nations, but they can give reservations a modest economic boost, so many American Indian tribes have fought for exclusive rights to casino gambling in their states. These goals have usually not been shared by other ethnoracial groups.

## Political Incorporation

A related effort has been the push for greater *political incorporation*. Full political incorporation requires the ability to participate in politics, the ability to have representatives of your choosing, and the ability of those representatives to participate in shaping public policy (see Browning et al. 1984, for an important formulation of political incorporation). People of color continue to struggle for full incorporation.

Today, legal barriers to basic participation are gone, but other obstacles remain. One concern is the way that legislative district lines are drawn. States – and often cities and counties – are divided into multiple legislative districts, and there are many ways to draw district lines to reduce the influence of a group of voters, either by spreading them out across several districts, so that they are too few in number to wield power in any of them, or by concentrating them in as few districts as possible, also reducing their influence below what it could be. In recent years, another widespread tactic has been to increase barriers to voting or remove procedures that had made voting easier; in either case, people of color are among those most likely to be disadvantaged by those changes.

Even where barriers to participation have been fully removed, there are challenges for representation. Some ethnoracial groups are too small to wield a great deal of influence at the ballot box, except in a few places. The largest groups, African Americans and Latinos, are able to dominate some districts, but their representatives have not always able to play a significant role in governing coalitions, sometimes finding their interests opposed by a majority of other legislators (e.g., Pinderhughes 1987).

## Sovereignty

Sovereignty has been a major concern for indigenous peoples. Sovereignty refers to control, typically over a physical space, and regaining it has been a key goal of many American Indian, Alaska Native, and Native Hawaiian groups. Each population experienced substantial loss of territory and considerable deprivation, and has worked to regain control over some of their ancestral lands.

In fact, some indigenous activists have argued that their efforts should not even be considered part of ethnoracial politics. American Indians,

they contend, belong to different nations and should not be seen as racial minorities (see, e.g., Wilkins 2007). Racial minorities came into existence through immigration – sometimes involuntary – but indigenous people are not immigrants, by definition.

This is also reflected in other political struggles of native peoples, such as efforts to regain rights to subsistence activities such as hunting, fishing, and harvesting. These rights were granted in treaty agreements with the United States, but, over the decades, they became the target of challenges, often from non-Hispanic Whites. Indigenous peoples have had to wage court battles to protect or restore those rights, sometimes facing intense bigotry in their fight.

## Immigration

In recent decades, immigration has become a major issue in ethnoracial politics. This issue has been important primarily to Hispanics and Asian Americans. In the 2010 census, almost two-thirds of Asian Americans were immigrants, giving them a pressing interest in policies that determined whether relatives or friends could immigrate to the United States.

Immigration might be an even bigger concern for Hispanics. While only about a third were immigrants in 2010, almost as many were children of immigrants, so that two-thirds of Hispanics were either first or second generation. In addition, large numbers of Hispanic immigrants do not have legal authorization to be in this country, often putting them in a very tenuous position and greatly restricting the life chances of unauthorized youth.

Although positions on immigration cut across party lines, some partisan divisions exist. Supporters of the Republican Party have been the most intense opponents to creating a path to legalization for unauthorized immigrants, arguing that such a move would reward lawbreakers. President Obama's Deferred Action for Childhood Arrivals (DACA) program instituted a partial path for many who came illegally as children, and Deferred Action for Parents of Americans (DAPA) program would have expanded this to some adults, but DAPA was put on hold by a federal court order in 2015 and was strongly opposed by many Republicans.

## Identity and Coalition-Building

The most important question for ethnoracial politics is how it will shape larger political coalitions. Given continued high levels of immigration, it is possible that people of color will outnumber non-Hispanic Whites by the middle of this century, with potentially dramatic political effects (Bowler and Segura 2012). Whether that will happen is a more complex question than it seems, and turns on questions of identity.

To understand this, one needs to understand that ethnoracial categories are social creations. The classification scheme currently used was created in the 1970s; before that, there was no consistency in the collection of ethnoracial data. In response to this disorganized state, the Office of Management and Budget (OMB) devised the ethnoracial categories that are used today, while emphasizing that these were not based on scientific findings and were for administrative purposes only. Predictions of a non-White majority tend to assume that these categories will continue unchanged, but we know that they have changed in the past and are likely to change in the future.

If the OMB categories did not change and people continued to follow them, then it is indeed very likely that people of color will outnumber non-Hispanic Whites by the middle of the twenty-first century. However, large numbers of those identifying as Hispanic also identify as White (although considerably less would do so if "Hispanic" was one of the options in the racial categories). In addition, we know that "mixed" ancestry children, those with a Hispanic or Asian parent and also a White parent, sometimes identify as White, and the children of those children may be even more likely to identify as White. Without

question, many Americans will continue to identify as Asian or Hispanic, but, if large numbers with Asian or Hispanic ancestry chose to identify as White, the predicted non-White majority might take much longer to materialize, if it ever does.

For Americans that socialized to accept the existing ethnoracial categories, it may seem unthinkable that large numbers of Americans will "cross" these boundaries. However, history shows that deep differences can disappear over time. A century or so ago, immigrants from eastern and southern Europe were seen as profoundly alien and never able to become fully American (e.g., Jacobson 1998). Those views have vanished today, of course. Societal dividing lines are drawn in our minds, making those lines very susceptible to change over the course of a generation or so (e.g., Alba and Nee 2003).

We know that there are other ways people do not identify with the OMB categories as well. For example, most of those who fall into the "Asian American" category do *not* first identify themselves as Asian American but instead choose an ethnic or national identify such as "Vietnamese" or "Korean American." The same is true for many Latinos, especially those who are immigrants. "American Indian" is an equally diverse category, and many of those who would fall within that category prefer to be identified by tribal affiliation, such as "Ojibwe" or "Hopi," or by a specific band within the tribe.

In addition, we cannot be sure how Asian Americans and Latinos will view their political interests in the coming years. In the first few decades of the twenty-first century, large numbers have turned against Republican candidates, but many Republican leaders are trying to change the image of their party. Immigrants and their descendants may influence policy change, but the overall impact would likely be less if they were more evenly divided in their political party allegiance.

Immigration may have significant consequences for African American politics and identity as well. For many decades, *minority politics* and *Black politics* were seen as virtual synonyms, and what we call ethnoracial politics focused largely on the battle for greater equality for African Americans. In the early twenty-first century, however, a tectonic shift occurred, as Hispanics surpassed African Americans as the largest population of color in the United States. One major question is how Blacks will adjust to this change of status. At times, there have been tensions, such as competition in Los Angeles between a mayoral candidate backed by African Americans and one supported by Latinos, but there seem to be enough commonality of interests for enduring Black-Brown alliances to be forged.

Immigration could trigger change even *within* the African American population, however. While still relatively small, there is a growing stream of immigrants from Africa, joining a continuing flow of African-ancestry immigration from the Caribbean. These immigrants could bolster the influence of long-established African American groups, if they join forces, but there have been tensions – as has often occurred between immigrants and native-born groups. Continued discrimination against darker-skinned Americans may eventually lead to stronger coalitions between all African-ancestry Americans, but such alliances are not going to happen automatically and will likely require that both immigrants and long-established African American groups make some political adjustments.

## Conclusion

The most important factor influencing the future of American ethnoracial politics is discrimination. If people of color continue to be treated as fundamentally different, experiencing exclusion and unequal treatment, they will have a powerful incentive to form coalitions to fight against that treatment. Today, there is a fierce debate over to what extent such discrimination will continue.

It is unlikely that all people of color will enjoy equal conditions in the near future, but it is

possible that *some* will experience much better conditions, while others do not. Although conditions have improved markedly for African Americans in the past half century, it is clear that they still experience high levels of poverty, substandard housing and schooling, higher levels of imprisonment, and other undesirable conditions which will not be eliminated soon.

On the other hand, many Asian Americans live in far more favorable conditions. In part, this reflects the fact that many Asian immigrants came with high levels of income and other resources and also that they arrived after civil rights laws had outlawed the worst types of discrimination, which had created such difficult conditions for large numbers of Black Americans. While there are significant numbers of Asian Americans in poverty and substandard housing, the vast majority do not experience this. Intermarriage rates – between Asian Americans and non-Asian Americans – tend to be very high by the third generation, also suggesting lower levels of discrimination.

Hispanic Americans seem to fall in between these two populations. By the second and third generation, many Latinos are prospering, although large numbers of immigrants struggle with considerable challenges, such as low levels of education or lack of legal status. Many Hispanics do not experience the levels of discrimination faced by African Americans, but hostility toward Latinos – and especially native-Spanish speakers – is not hard to find. If Hispanics do indeed find themselves making considerable progress over the next few generations, their political preferences would likely be less distinct from those of non-Hispanic Whites. Some argue, however, that Hispanics will continue to experience unequal treatment, making them more likely to continue to ally themselves with a coalition of other marginalized groups (see, e.g., Telles and Ortiz 2008).

Finally, the contours of American ethnoracial politics could be reshaped yet again. In the immediate years after World War II, no one anticipated that Latinos and Asian Americans would emerge to become substantial political forces. Could other groups face growing marginalization and come to identify more as people of color?

In the first decades of the twenty-first century, the most likely possibilities include Americans of Middle Eastern ancestry and Muslims. Concerns over terrorism have led to periods of strong hostility toward these groups. The Office of Management and Budget classifications defined people of Middle Eastern ancestry as White, but in the wake of the attacks of September 11, 2001, many experienced bigotry more commonly felt by people of color. While it is impossible to know what the future holds for these groups, their recent experiences provide more evidence that ethnoracial politics is dynamic, and that some groups can "exit" while others "enter" into the marginalized status which is at the heart of that politics.

# European Harmonization and EPSAS

Thomas Müller-Marqués Berger
Ernst and Young, Stuttgart, Germany

## Synonyms

European Public Sector Accounting Standards (EPSASs); International Public Sector Accounting Standards (IPSASs); Public sector accounting

In its report "Towards implementing harmonised public sector accounting standards in Member States, The suitability of IPSAS for the Member States" from 2013 the European Commission derives the necessity to harmonize public sector accounting in Europe. This is mainly due to the fact that there is a great heterogeneity of public sector accounting practices in Europe. The European Commission (EC) strives to set uniform and binding financial reporting and accounting standards. In view of the EC, the starting point for the preparation of European Public Sector Accounting Standards (EPSASs) should be the International Public Sector Accounting Standards (IPSASs). However, it is clear that these standards need to be modified and adapted to the specific needs and circumstances in Europe. The following article's aim is to give an overview on the current status and recent developments regarding harmonization in public sector accounting in Europe and the role that IPSASs play hereby.

## Background: The Sovereign Debt Crisis as the Starting Point for EPSAS

The sovereign debt crisis in Europe has shown that there is a need for an accounting reform and harmonization of the financial information in the European Union (EU) public sector. Fiscal transparency has turned out to be essential for macroeconomic stability, surveillance, and policy in the EU. Better fiscal Government Finance Statistics (GFS) data at macro level requires harmonization of public sector financial accounting at micro level. Achieving fiscal transparency is therefore crucial to the proper functioning of the EU multilateral and budgetary surveillance framework and to the functioning of the single market (Müller-Marqués Berger and Heiling 2014; Mussari 2014).

Macro (statistical) data and fiscal coordination at the EU level are already based on accrual data, but government accounting practices vary widely both across and within the Member States (Dabbicco 2015). Also accrual accounting practices are not comparable, and there are still Member States and government entities therein that operate on a cash-only basis (e.g., Germany or the Netherlands at central level). The absence of a harmonized accrual-based accounting system in Europe has led to the conclusion that there is no real transparency on the financial position and financial performance in the Member States (Jones and Caruana 2014). Also an insufficient use of ex post financial information, independent of the basis of accounting, by politicians can be recognized. The main focus of politicians is still on the (cash-basis) budget. Beyond that, another major weakness in the European public finance management is the current incoherence between financial accounting and ESA 2010. The quality of public finance statistics is however strongly dependent on the reliability and comparability of public accounting systems.

The described observations revealed the need for an accounting reform and harmonization of the financial information in the EU public sector (Manes Rossi et al. 2016). In order to be more transparent and accountable, Member States need to provide comparable and more comprehensive information about their financial position and performance.

## Steps Taken by the European Commission

As outlined before, it is evident that public sector accounting needs to be improved to prevent the

risk of low-quality data flows to Eurostat. Eurostat is a Directorate-General of the European Commission in charge of providing statistical information to the institutions of the European Union and to promote the harmonization of statistical methods across Member States. But also improving the quality of public sector accounting in its own right is a major driver of the EPSAS reform project. The European Commission has therefore tasked Eurostat to take the lead in this project.

The EC has taken the following steps over the past few years in improving and reforming the public sector accounting framework within Europe:

## Council Directive 2011/85 EU

As outlined before, the starting point of the European Commission (EC) initiatives was the Council Directive in 2011. In this Directive, complete and reliable fiscal data which is comparable across Member States is pointed out to be crucial to avoid excessive government deficits in the future. Furthermore, it is specified that this can only be achieved through the implementation of a system of harmonized accrual-based accounting standards, consistent with the ESA, for all entities of the government sector.

Article 16 of the Council Directive also included a provision that by 31 December 2012, the Commission shall assess the suitability of the International Public Sector Accounting Standards (IPSASs) for the Member States as these standards are seen as the only internationally recognized set of public sector accounting standards.

## Public Consultation on the Suitability of IPSAS for the Member States in 2012

Based on Article 16 of the Council Directive, Eurostat initiated a public consultation to assess the suitability of IPSAS for the Member States in the status quo as per 2012. The results of this consultation were as follows (Fig. 1):

Important to know when interpreting the pie chart is that the participants supporting the suitability expressed the concern as to whether IPSAS in their current form could be easily implemented in the EU Member States. The same applies to the category answering "partly," as these respondents acknowledge the need for accrual-based public sector accounting standards but had doubts whether the IPSASs in their current form as per 2012 were suitable. As a result it was concluded that at least 69% of the respondents considered that IPSAS in general could be a suitable basis but could not be entirely adopted in their 2012 status.

The respondents against IPSAS (28%) raised the following arguments:

**European Harmonization and EPSAS, Fig. 1** Results of the public consultation on the suitability of IPSAS for the Member States

- IPSASs are incomplete with respect to public sector accounting requirements.
- The standards are too complex.
- The rules on disclosures are heavy.
- There is a strong link to IFRSs (International Financial Reporting Standards) used in the private sector.
- The missing IPSAS governance arrangements, i.e., the lack of oversight.

### Study on "Overview and Comparison of Public Accounting and Auditing Practices in the 27 EU Member States"

In the context of the assessment of the suitability of the International Public Sector Accounting Standards for the Member States, Eurostat asked the professional services firm EY to:

- Collect relevant information on the existing public accounting and auditing practices for the 27 EU Member States, for all subsectors of general government.
- Prepare a comparative analysis of the 27 EU Member States.

The comparative analysis of the study revealed that the European government accounting arrangements were greatly heterogeneous. It turned out that Member States national/central level had the most complex accounting arrangements. They usually followed their own accounting standards, mainly for independence reasons, and these standards were very different from one state to another. Furthermore, in most of the cases, their standards showed little resemblance with the IPSAS.

Also a great diversity of bookkeeping systems used by the different subsectors of government within a country was identified. Although double-entry bookkeeping systems were widespread, none of the European countries had a unique bookkeeping system for all subsectors of government. Finally respondents to the survey highlighted the fact that IPSASs were either incomplete or too theoretical for use in public sector accounting.

### Report of the European Commission in 2013

In March 2013, the European Commission issued the report "Towards implementing harmonised public sector accounting standards in Member States." In this report the Commission explained why in their view, there was a need for harmonized accrual-based public sector accounting standards. The report stated that "harmonised micro-accounting systems for all public sector entities (i.e., general government) in all EU Member States, [. . .], seems the only effective way forward to compile accruals-based debt and deficit data of the highest quality standards in accordance with existing legal requirements."

The report concluded that whereas "IPSASs represent an indisputable reference framework for potential EU harmonised accruals-based public sector accounts," IPSASs cannot be simply implemented in the EU Member States in their current status. Therefore, the report recommended the development of a single set of accrual-based accounting standards at all levels of government throughout the EU, the so-called European Public Sector Accounting Standards (EPSASs).

IPSASs are considered as a reference framework for the future development of a set of European Public Sector Accounting Standards (EPSASs). The debate whether IPSASs should be the starting point or if accounting and financial reporting frameworks of EU Member States should be used as (additional) starting points is still ongoing among the various stakeholders in EPSAS standard setting (Müller-Marqués Berger and Heiling 2015).

At macro level, data is already aggregated on an accrual basis following ESA 2010. But even in cases where accrual accounting is already in use on an entity level, there are efficiency and quality gains to be expected from harmonizing accounting standards within the EU and from aligning these standards to ESA as much as possible, but not forgetting the different objectives of the two systems. It is broadly accepted that significant benefits can be gained from generating financial statements and statistical reports using a single integrated financial information system.

### Brussels Conference in 2013

A further milestone in the EPSAS project was the Eurostat conference held in Brussels on the implementation of EPSAS. In this conference several

important politicians and executives, such as Herman Van Rompuy, the EU Council President at that time, or Algirdas Šemeta, the European Commissioner for Taxation and Customs Union, Audit, and Antifraud, confirmed the need to develop harmonized public sector accounting standards in the EU.

### Consultation on Governance by Eurostat on EPSAS in 2013

Through this consultation, Eurostat wanted to gain a view on the opinion regarding the governance for EPSAS.

The following graph outlines the proposed governance structure for EPSAS (Fig. 2):

In total 203 submissions were obtained from a variety of stakeholders (public authorities, organizations, associations, and private individuals) of which 194 submissions came from EU countries.

An analysis of the submissions showed that a majority of the respondents were of the view that no additional oversight function was necessary on top of what is already ensured through the different institutions of the European Union. Almost 75% of the respondents answered that the oversight role of the EPSAS Governance Advisory Board as outlined in the Consultation Paper would be appropriate for EPSAS or would at least be partly appropriate.

A significant proportion of respondents were of the view that the additional oversight function is unnecessary and would only increase the bureaucracy and the cost of standard setting. Some suggested alternatives to ensure oversight, such as the Court of Auditors, Economic and Financial Committee, special Commission of the European Parliament, high-level representatives (deputy ministers) for political coordination, etc.

A majority of respondents also agreed that there was a need for formal and organized involvement of stakeholders in the EPSAS standard-setting process.

### PwC Study Performed on Behalf of Eurostat in 2014

The consultation in 2013 was followed by a second request made by Eurostat to collect information related to the potential impact, including costs, of implementing accrual accounting in the public sector and to prepare a technical analysis of the suitability of individual IPSAS standards. This study was performed by the professional services firm PwC on behalf of Eurostat. In this study the cost of implementation at EU level was estimated to amount between 1.2 billion EUR and 6.9 billion EUR. The study underlined that most governments are relatively positive about using IPSAS as a primary reference for developing EPSAS. The

**European Harmonization and EPSAS, Fig. 2** Proposed governance structure for EPSAS (Source: Eurostat, Public Consultation Paper: "Towards implementing European Public Sector Accounting Standards (EPSAS) for EU Member States — Public consultation on future EPSAS governance principles and structures," Luxembourg, 25 November 2013)

standards exist and are of an overall good quality, and adopting accounting principles that are recognized on the international level will give greater credibility to the government's financial statements in the eyes of investors in bonds and other fund providers. However, it was recognized that some of the IPSAS standards cannot be fully implemented in their current state. Hence, there is a need for the development of more specific EPSAS. However, the general opinion was more positive compared to the study of 2012 in the sense that more IPSASs were assessed as being applicable with no or minor changes.

### Support of Eurostat in the Supply of Statistical Services in the Field of Public Sector Accounting

In October 2015 Eurostat has issued a public tender on "Supply of statistical services in the field of public sector accounting." After the studies in 2012 and 2014, Eurostat sought for support for the development of harmonized European public sector accounting standards (Task 1) and collection of further information related to the potential impacts of implementing accrual accounting in the public sector (Task 2). Whereas in the second study for Eurostat on EPSAS in 2014 the economic and social impact of an EPSAS implementation was done mainly on a qualitative basis, the aim of Task 2 of this project is to collect additional and updated information related to the potential impacts of implementing accrual accounting in the public sector on a quantitative basis. Based on the results of the 2014 study, an analysis and update of the ongoing or planned national public sector accounting reforms in the six countries assessed as among the least mature in 2014 need to be performed. This project started end of 2015 and lasts for approximately 1 year. This consultancy project was awarded to EY.

## EPSAS Working Arrangements

Since 2012, several task forces/working groups have been set up to move the development of EPSAS forward.

### EPSAS Task Force on Governance

The EPSAS Task Force on Governance held its first meeting in 2013 and was created to exchange views with the Member States' authorities on possible EPSAS governance arrangements and underlying key principles of EPSAS. The Task Force assists Eurostat to identify the key issues for EPSAS governance, discuss how to balance these issues, and develop a model for the EPSAS governance structure.

### EPSAS Task Force on Standards

The EPSAS Task Force on Standards held its first meeting in 2014 and was created to exchange views with the Member States' authorities on technical aspects of the standards. The Task Force assisted Eurostat to:

- Analyze the most contentious IPSAS and address the concrete difficulties encountered with some of the IPSAS in practice and ways to overcome them.
- Analyze the possibility to reduce burden and complexity of the standards for small public entities.
- Discuss the implementation of standards via a progressive batched approach.

The Task Force was shut down with the establishment of the new EPSAS Working Group.

### Working Group EPSAS

The objective of the Working Group EPSAS is to provide the Commission (Eurostat) advice and expertise in the preparation of harmonized European public sector accounting and general purpose financial reporting standards on an accrual basis (including for central government, state government, local government, and social security funds). At a later stage, the further objective will be to advise on the introduction and operation of EPSAS. The Working Group had its first meeting in September 2015 in Malta, where Eurostat presented the reworked EPSAS approach.

### EPSAS Cell on First-Time Implementation

In order to take forward the discussion on the first implementation and the opening balance sheets on

an accrual basis and to focus the work on a more technical level, at the March 2015 Task Force meeting, it was proposed to establish a Cell on First-Time Implementation (FTI).

The objective of the Cell on FTI is to support Eurostat in the preparation of technical level working documents based on the experience and expertise of a smaller group of experts.

The Cell is not a decision-making body; it is a reflection group. The Cell discussion will be used to inform the eventual proposal made by the Commission for EPSAS first-time implementation, focused on the opening balance sheet on an accrual basis.

Next to the EPSAS Cell on First-time Implementation, Eurostat implemented the EPSAS Cell on Governance Principles. Next to these two cells, further cells are about to be set up. The following graph summarizes the envisaged approach by Eurostat (Fig. 3):

## Current Status of the EPSAS Project

The European Commission was of the view that the legal basis for EPSAS should be established in a Framework Regulation. Whether the legal form of a regulation is needed to achieve the objectives of the EPSAS project is questioned; a directive might be equally appropriate. In any case, the EPSAS standards would take the form of binding legal acts, developed by an EPSAS Committee that is composed of representatives of Member States and chaired by the European Commission. The Committee would be supported by technical working groups and task forces. Other stakeholders would be involved via consultations or as observers.

Based on the diverse picture of public sector accounting practices in European Member States, it is clear that EPSAS can only be implemented in a medium-term perspective. Given that some Member States still account on a cash basis, EPSAS can only be implemented in a staged approach. Vice versa for Member States that already have implemented accrual accounting and/or IPSAS, the EPSAS reform should not be a step back. This means that the new EPSAS accounting framework should provide the same level of information than their current accounting system. Also the initial focus for EPSAS standard setting should be on the public sector-specific issues, like accounting for taxes or reporting of social benefits. When it comes to the narrowing down of options, also materiality considerations need to be considered. It is also discussed what kind of relief smaller and less-risky entities should be provided with regard to the future EPSAS requirements.

In terms of timing, the original timetable, as outlined below, envisaged that the Framework Regulation would be in place before the start of the technical development of standards (Fig. 4).

In the meantime, this approach has been changed and it is envisaged that:

**European Harmonization and EPSAS, Fig. 3** Envisaged approach by Eurostat in 2015

**European Harmonization and EPSAS, Fig. 4** Original timetable for the implementation of EPSAS

**European Harmonization and EPSAS, Fig. 5** Revised timetable for the implementation of EPSAS

1. The technical development of EPSAS should start before the approval of a Framework Regulation or comparable legal basis.
2. Member States should not only be encouraged to implement accrual accounting in general but to also use accrual-based IPSAS on a voluntary basis.
3. As soon as the framework is in place, EPSAS shall be implemented by a staged approach.

The following graph summarizes the new approach taken by Eurostat/EC for the development and establishment of the EPSAS Framework (Fig. 5):

Eurostat's view is that the EPSAS Framework should comprise:

- The principles for EPSAS governance
- The governance mechanisms
- The process for public consultations ("due process")
- Creation of the preconditions for EPSAS standard setting (bodies within the EPSAS governance structure, their relationships, and resources)
- IPSAS as being the first point of reference for EPSAS.

## Conclusion

The article gave an overview on the development of European Public Sector Accounting Standards (EPSASs). Based on the heterogeneity of public sector accounting practices in Europe, it is obvious that EPSAS can only be implemented in a medium-term perspective and that harmonization of public sector accounting in Europe can only be achieved in a medium- to long-term perspective. Whereas the initial approach was to first have a Framework Regulation in place, the aim of the EPSAS project is now to complete the technical part of the project before the approval of a Framework Regulation or comparable legal basis

Open governance; Transparency

## Definitions

Law enabling access to the information and documents of government

Access to government records and information is an essential requirement for developing and maintaining a civil and democratic society. Disclosure facilitates public knowledge and discussion. Knowledge provides an important guard against abuses, mismanagement, and corruption. Governments also benefit from free information.

Openness and transparency in the decision-making process develop citizen trust in government actions.

Many governments are making more information about their activities available. Numerous countries around the world have now adopted comprehensive Freedom of Information (hereinafter "FOI") Acts and more have pending efforts. While FOI acts have been around for several centuries, over half of the FOI laws now in effect were enacted in the last 20 years. The growth in transparency is in response to demands by civil society organizations, the media, and international lenders.

## History of FOI Laws

The need for Freedom of Information was first recognized in Sweden with the Freedom of the Press Act, approved in 1766. In 1789, the French Declaration of Rights of Man called for the right of citizens to review expenditures of the government. Over the years, access became more common to debates in Parliaments and the opening of most courts.

Article 19 of the UN Declaration of Human Rights states:

> Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

Following the UN Declaration of Human Rights, countries slowly began to enact comprehensive laws for access to government-held documents and information: Finland enacted its law in 1951; the United States enacted its Freedom of Information Act in 1966, France in 1978, and Canada, Australia, and New Zealand in 1982. The last 20 years have been the most active period of countries adopting freedom of information laws. (For instance, Germany passed the Federal Act Governing Access to Information held by the Federal Government (2005), and Switzerland adopted the Swiss Federal Act on the Principle of Freedom of Information in Public Administration in 2004.) In Western Europe, only Luxembourg lacks legislation, and most Central and Eastern European countries have adopted laws as part of their transitions into democracies. Many Asian countries have either adopted laws or are on the brink of doing so. (National FOI legislation in India (passed in 2005), FOI laws have recently been passed or entered into force in countries like Mongolia (FOI law passed in 2011), Bangladesh (legislation in force since 2009), and Indonesia (a FOI law is in force since 2010), and draft FOI laws are under discussion in a number of others.) Pakistan approved a Freedom of Information Ordinance in 2002. In Latin America and the Caribbean, 19 countries have national FOI laws. (Antigua and Barbuda (2004); Belize (1994); Brazil (2011); Colombia (1985); Chile (2008); Dominican Republic (2004); Ecuador (2004); El Salvador (2011); Guatemala (2008); Guyana (2013); Honduras (2006); Jamaica (2002); Mexico (2002); Nicaragua (2007); Panama (2002); Peru (2002), Saint Vincent and the Grenadines (2003) and Trinidad and Tobago (1999). A Presidential Decree on FOI exists in Argentina (2003).) Africa is also opening up; South Africa enacted its law in 2001 with 21 other African countries passing their own laws. (Angola (2002), Ethiopia (2008), Uganda (2005), Zimbabwe (2002), Liberia (2010), Guinea (2010), Nigeria (2011), Tunisia (2011), Niger (2011), Togo (2016), Burkina Faso (2015), Sudan (2015), South Sudan (2013), Cote d'Ivoire (2013), Mozambique (2015), Sierra Leone (2013), Rwanda (2013), South Africa (2000), Tanzania (2016), Kenya (2016), Morocco (2016), Malawi (2017)).

In addition, countries have adopted other laws that can provide for limited access to information. Data protection laws allow individuals to access their own records held by government agencies as well as private organizations. Other statutes give rights of access in areas such as health or the environment. Laws codifying practices of openness and access have also increase information availability.

### Factors for Adoption

In general, civil society groups have played a key role in adoption of laws in many countries. Campaigns by press and environmental groups. Government are providing more information a

part of their "e-government" efforts to make services more efficient and accessible.

- Many new or recently revised constitutions include a specific right of access to the public. This required adoption of new laws by the constitutional legislatures. Over 20 countries have constitutional provisions on access. Sweden's Act is part of its constitutional system. In Latin America, these provisions are known as Habeas Data. (A constitutional remedy giving courts jurisdiction to order release of an individual's data.)
- International bodies such as the Commonwealth, Council of Europe, and the Organization of American States have drafted guidelines or model legislation to promote freedom of information. The World Bank, the International Monetary Fund, and others are pressing countries to adopt laws to reduce corruption and make financial systems more accountable.
- Other longer-established democracies are finally adopting legislation as a result of sustained campaigns by civil society and political scandals relating to health and the environment. This included Ireland, Japan, and the United Kingdom.
- The expansion of the Internet in common usage has increased demand for more information by the public, businesses, and civil society groups.

## A Brief Comparison of Laws

Overall there are many commonalities between the laws. In part, this is because only a few countries' laws have been used as models. The US FOIA has probably been the most influential model, along with Canada's and Australia's laws (Ackerman and Sandoval-Ballesteros 2006).

The most basic feature of FOI laws is the ability to ask for materials held by government departments. This is defined as records, documents, or information. The definitions vary and led to gaps in access as computers replaced paper filing systems. Newer laws broadly define the electronically store information ("ESI") so that there is little difference between them.

The right to request information is generally open to citizens, permanent residents, and corporations in the country without a need to show a legal interest such as an injury that needs the information to remedy the harm. Laws such as Ireland's and the United Kingdom's allow anyone around the world to ask for information (Banisar 2006). The US FOI has been used by newspapers and NGOs in countries with no FOI Act. These groups use the US FOI to highlight the lack of information available in the country (Banisar 2002).

Access is generally limited to information which is already recorded. Many Western European laws limit access to "official documents" which does not include drafts and other internal documents. Certain laws such as the Irish FOI require departments to provide a written explanation of decisions that affect their interests, and the Danish Act requires authorities to record information of importance. In some jurisdictions such as Austria and under the UK Code of Access to Information, the duty is only to provide information or answer questions, not to provide the original documents.

### Which Government Bodies Are Covered

The acts apply to nearly all major government bodies in the various countries, except for the Parliament and the Courts. In some countries, the security and intelligence services are also exempt from coverage. In many parliamentary systems, documents that are submitted to the Cabinet for decisions and records of Cabinet meetings are also excluded.

An interesting development is the growing trend toward extending FOI laws in countries to include nongovernmental bodies such as companies and NGOs that receive public money to do public projects. This is frequently used to cover hospitals. Contract Sunshine Acts now require disclosure of information from hospitals that take state contracts (Mem'l Hosp.-W. Volusia, Inc. v. News-Journal Corp1999).

This could have broad affects as more basic government functions are outsourced to private

entities. In South Africa, the law also allows individuals and government agencies to obtain information from private entities if it is necessary to enforce people's rights. Thus far, there have been no cases on this issue, but it is consistent with data protection acts and environmental regulations in other countries.

As international governmental organizations play an increasingly important role, the right of access to information must be codified in these new agreements. A key problem with access to information is that these organizations are based on a diplomatic viewpoint and thus limit access to information. Thus, decisions that were once made on a local or national level where the citizen had access and entry into the process are now being made outside the country in a more secretive setting. Activists have constantly pressured organizations such as the WTO, the World Bank, and the IMF to release more information. However, this is still limited. The EU's access regime is still more limited than that of most of the member countries.

### Exemptions and Balancing

There are a number of common exemptions that are found in nearly all laws. These include the protection of national security and diplomacy, personal privacy, commercial confidentiality, law enforcement and public order, information received in confidence, and internal discussions.

Many laws have provisions that require that a harm must be shown before the information can be withheld. The test for harm varies depending on the type of information that is to be protected. Privacy, commercial confidences, and national security tend to get the highest level of protection.

A number of countries' laws require that any exemptions be balanced against disclosure in the public interest. This allows for information to be released even if harm is proven if "public benefit in knowing the information outweighs any harm that may be caused from disclosure." This is included in the Council of Europe's recommendations and is included in several laws including New Zealand, the United Kingdom, and Bosnia.

In many laws, factual information is frequently required to be released even when the full documents are exempted from release.

### Appeals and Oversight

A key feature of any act is how it deals with appeals from those who have had their requests for information denied. There are a variety of mechanisms for enforcing acts. These include administrative reviews, court reviews, and enforcement by independent bodies generally referred to as information commissioners. The effectiveness of these different methods varies greatly. In general, the jurisdictions which adopted an ombudsman or information commissioners appear to have greater openness. Ireland and New Zealand are frequently cited as having some of the most vigorous oversight systems (Organisation for Economic Co-Operation and Development 2002).

The first level of appeal in most countries is the internal appeal. This typically involves appealing to a higher level in the department that the request was made to asking them to review the denials. This is of mixed utility. The experience in many countries such as Australia is that the internal system tends to uphold many of the denials and is used more for delaying releases than enhancing access.

Once the internal appeals have been completed, the next stage is an appeal to an external body. In some countries, such as Nordic ones but also Hungary and New Zealand and some Canadian provinces, appeal can be made to an ombudsman, typically an officer of the Parliament. The ombudsman usually does not have the power to make a binding decision, but their decisions are considered to be quite influential and typically are followed by the government body. However, generally many ombudsmen are limited to handling specific cases and are not able to look more systematically at how FOI is working.

A more expansive approach that has been successful in at least 37 countries is the creation of an independent information commission, which can be part of the Parliament, the Prime Ministers' Office (such as in Thailand), or an independent body. In some countries such as Canada, France, Belgium, and Portugal, these are independent bodies that just focus on FOI. The national Hungarian, Canadian, and German provincial models have combined the FOI commission with

the national data protection authority. The new UK and Estonian laws also include this provision. In Ireland, the information commissioner is also the general ombudsman.

An information agency can be tasked with many duties besides merely handling appeals. This includes general oversight on whether the system is working but also reviewing and proposing changes, training, and public awareness. In some countries such as Ireland and the United Kingdom, the Information Commissioner has the power to make binding decisions, subject to limited appeals or overrides by ministers in certain cases.

The final level of review in most FOI laws is the courts. Most laws around the world allow the requestor to appeal to either specialized courts such as the Administrative Appeals Tribunal or the national courts. The courts can obtain copies of most records and make decisions. Depending on the procedure needed to gain access to the documents and the scope of the review, the utility of the courts vary. In some countries, the court can only review a point of law once a tribunal decides.

A less efficient system is where the courts serve as the only external point of review, such as in the United States. This effectively prevents many users from enforcing their rights because of the costs and significant delays involved in bringing cases to courts. The courts are also generally deferential to agencies, especially in matters of national security-related information.

### Duty to Publish Information

Another common feature in FOI laws is the duty of government agencies to routinely release certain categories of information. These typically include information on the structure of the organization, its primary functions, a listing of its top employees, annual reports, and other information. Newer FOI laws tend to proscribe a listing of information, except in the United Kingdom, where the information commissioner can issue a model publication scheme and must approve each entities' scheme (over 70,000).

One problem is how to ensure adequate dissemination of that information. Electronic networks are one possibility. In the United States, the Electronic Freedom of Information Act promotes the disclosure of records in electronic form. This leaves the possibility of not only providing for more efficient, quick access, but also new ways of using information such as using transactional records and geographic information systems to analyze government records in different ways. In Estonia, the FOI requires each public body to maintain a web site and includes a long list of information that must be on each site.

## Conclusion

Freedom of information laws make governments more open and clearer to their citizens. That openness provides awareness of government actions that facilitates analysis and discussion. Discussion and knowledge of the citizens ward against neglect and venality.

# Evaluating the Institutional Performance as a Tool for Public Policy Evaluation

Khalid Yehia Youssef
Faculty of Economics & Political Sciences, Cairo University, Cairo, Egypt

## Synonyms

Institutional performance assessment; Institutional performance measurement; Organizational performance; Public policy assessment

## Definition

Public policy evaluation is a continuous analytical tool for assessing the performance of policy programs which are usually implemented by public organizations with a participation of civil society organizations and the private sector, therefore evaluating the performance of these organizations will help in evaluating public policy.

## Introduction

Public policy is usually evaluated before, during, and after its implementation. Government is often the main responsible for implementing the public policy by its governmental organizations; in some cases, some nongovernmental organizations can share in implementing some public policies. The public policy effective implementation depends on the efficiency of the institutional performance of the implementing organizations, so evaluating the institutional performance of these organizations may help in evaluating the public policy. This study tries to illustrate the relation between evaluating the institutional performance and public policy evaluation, also the differences between them, and how far the evaluation of the institutional performance can help in evaluating public policy.

## The Relation Between Evaluating the Institutional Performance and Public Policies Evaluation

If public policy is a plan or a program followed by an individual, group, or institutional performance, to achieve a goal or to solve a problem, if it is a result of a set of formal and informal interactions among some actors at the local and central levels within a policy network (Gomaa 2001), and if the making of public policy is the mission of the government, the parliament, and the judiciary, with sharing of civil society organizations, international institutions, policy parties, lobbyists and stakeholders, but the implementation of public policy is often one of the main responsibilities of the government (Signé 2017; O'Toole 2000; DeGroff and Cargo 2009) whether the non-governmental organizations share in the implementation or not. The government often implements the public policy just through its organizations, which are usually the main responsible for the greatest part of the implementation of this policy, with cooperation from some non-governmental organizations as civil society organizations and the private sector.

Many studies illustrated the relation between evaluating public policy and institutional performance evaluation, and that the evaluation of public policy determines the value added by the public policy, and provides information to decision-makers to improve and develop the institutional performance commensurate with the target values from this public policy (Vedung 1997; Mackay and Baird 1998).

Since the public policy is usually made for all members of society or a large part of them, this requires a continuous evaluation for the performance of the organizations which implement this policy, to ensure that plans and programs are

implemented as planned, and to deal with any negative deviations.

Although there is a high level of interaction among government, nongovernmental organizations and private sectors are the main components of the policy network (Gomaa 2001). Most of the nongovernmental organizations in many countries – especially the private sector organizations – might not directly share in the implementation of some public policies, but they may share in implementing them indirectly by adherence to the laws and decisions issued to implement some public policies or benefiting from it. Consequently, the institutional performance of nongovernmental organizations may be significantly affected by the implementation of some public policies related to their activity; this effect will appear in the evaluation of these organizations, so we can say that in some cases public policy may be evaluated by evaluating the performance of the organizations correlated to this public policy, and that the whole performance results of these organizations will determine the results of this public policies; on the other hand, analyzing the institutional performance results of the implementing organizations of public policy can help in the future policies making (Caiden and Caiden 2001).

Public policy is often implemented by many organizations, so it is necessary to have suitable cooperation and coordination among the organizations which implement this public policy (Mthethwa 2012), and evaluators must have a great awareness and experience to evaluate the performance of these organizations (DeGroff and Cargo 2009).

The efficiency and effectiveness of policy implementation are correlated to the efficiency and effectiveness of implementing the organizations' performance, so the implementing organizations either undertake long-term planning to ensure effective implementation for the policy (Mayer 2007), or impede the implementation of the policy, or do not implement it in the target time (Olson 1973). The efficiency and effectiveness of the public policy and implementing organizations may not be the same, and that the performance of the organizations may be efficient, but the policy may not be made efficiently; on the other hand, the policy may be made efficiently but the performance of the implementing organizations may not be efficient.

## The Role of Institutional Performance Evaluation in Every Stage in the Policy Cycle

### Identifying the Problem or the Future Case

The public policy usually aims to make a development in the community or to solve a public problem. Public problem is often because of a wrong or a weak performance in the responsible public institutions, therefore, evaluating the performance of these institutions may illustrate the reasons for these public problems. The weak performance can be known by the public surveys which show how far the target citizens are satisfied with the services of the public organizations. Solving the reasons for the weak performance of the implementing organizations may improve their performance to be compatible with public policy goals.

### Identifying and Formulating the Possible Alternatives of the Policy

Policymakers must determine the alternatives of the policy and formulating them qualitatively and quantitatively to identify the financial and technical capabilities of the organizations which are expected to implement these alternatives.

### Decision-Making

Decision-makers select the best alternative according to its expected efficiency and effectiveness which are determined by the expected capabilities of the implementing organizations.

### Implementation

Every step in the implementation stage has to be evaluated to determine the deviations of the performance by comparing what was achieved with what was planned. The reasons for these deviations must be solved immediately. Evaluating the institutional performance of the implementing organizations during the implementation stage

may be the most important step in the evaluation process.

### Evaluation

Public policy is usually formulated in a plan or a program, the results of this plan or program – whether they are outputs, outcomes, or impacts – must be evaluated by comparing what has been achieved with what has been targeted; this can be done in details by evaluating the outputs, outcomes, and impacts of the organizations which implement the public policy. On the other hand, if the policy was formulated in decisions or laws, it must be evaluated by comparing the policy impacts by its goals; this can be done by comparing the improvement in the targeted community by the goals of the public policy.

The role of institutional performance evaluation in every stage in the policy cycle can be presented in the following Fig. 1:

## The Relation Between Evaluating Public Policies and Institutional Performance Evaluation Can Be Illustrated in the Following Points

### The Location of Both of Them to the Other

If the public policy is usually formulated in plans, programs, laws, or decisions, institutional

**Evaluating the Institutional Performance as a Tool for Public Policy Evaluation, Fig. 1** The role of institutional performance evaluation in every stage in the policy cycle

E

performance is the actual implementation of those plans and programs, so evaluating the institutional performance of the organizations which implement these plans and programs is an integral part of the public policy evaluation process (Fig. 2).

### Goals

The goals of the organizations which implement the public policy are subgoals of the public policy goals, but they have been formulated in a partial, specialized, and more detailed formulation; these goals are the bases of the evaluation indicators of both the institutional performance and public policy (Fig. 3).

### Evaluation Stages

Evaluation of the public policy may be a continuous process implemented at all the stages of the policy cycle, or it may be one process implemented at the end of this cycle. Evaluating the institutional performance may also be a continuous process implemented during all the phases of the plans or programs for controlling, correction, accountability, and forecasting, or one process implemented at the end of the plan or program for accountability and learning.

The process of public policy evaluation can be done in three phases:

Phase I: Evaluating Public Policies Before Implementation

In this phase, public policy is evaluated to determine the suitable alternatives for the policymakers by identifying the expected outputs, outcomes, and impacts of each alternative to select the optimal alternative. Stakeholders can accept, reject, or modify the selected policy alternatives. The institutional performance of the organizations which will implement the public policy must be evaluated to determine their implementation abilities before the implementation process.

**Evaluating the Institutional Performance as a Tool for Public Policy Evaluation, Fig. 2** The role of the institutional performance evaluation in evaluating the public policy

**Evaluating the Institutional Performance as a Tool for Public Policy Evaluation, Fig. 3** Goals of implementing organizations as subgoals of public policy

Phase II: Evaluating Public Policy During Its Implementation

Public policy is evaluated in this phase by comparing what has been achieved with what has been planned. There are several advantages for this evaluation, such as fast dealing with unexpected deviations and crises, or developing the policy to be compatible with any new unexpected variable. The main step in evaluating the public policy implementation is evaluating the institutional performance of the organizations which are implementing it, and that any deviation in implementing the public policy may be due to some deviation in the institutional performance of the implementing organizations.

Phase III: Evaluating Public Policy After Implementation

In this phase, public policy is evaluated after the end of the implementation process to determine how far the objectives of this public policy have been achieved, and determine the current and future impacts of this policy. The final results of evaluating the institutional performance of the organizations which implement the public policy or which were affected by it represent a large part of the final results of evaluating the public policy.

Evaluating the institutional performance can also be done in three phases:

Phase I: Before the Implementation of the Plan or Program

In this phase, the plan or program is evaluated and reviewed to determine the required quality levels of performance for each implementation stage, and to determine also the sources of the materials and how far they are available for each stage.

Phase II: During the Implementation of the Plan or Program (Continuous Evaluation)

The implementation process is evaluated in this phase to determine the deviations between the actual performance rates and the target rates in order to solve the causes of the negative deviations, support the causes of the positive deviations, and keep the quality levels of performance as what was planned.

Phase III: After the Implementation of the Plan or Program

In this phase, a comprehensive evaluation is done to determine how far the objectives of the organization are achieved by comparing the actual performance results with the target results, identifying negative and positive deviations and their causes, and who is responsible for these results.

### Evaluation Bases

Public policy or institutional performance is usually evaluated based on comparing the actual results with target results, or comparing the performance results of the last period with the results of the previous periods.

The relations between evaluating public policy and institutional performance can be illustrated in the following Table 1.

## The Differences Between Evaluating Public Policies and Institutional Performance Evaluation

There are many differences between evaluating public policy and evaluating institutional performance. We can illustrate these differences in the following points:

### Subjects of Interest

Public policy is usually interested in public subjects (problem, idea, or case), and its evaluation focuses on societal goals, and how far these goals have been achieved, but the institutional performance focuses just on the organization, its evaluation is just interested in the results of the organization's performance, and how far its objectives have been achieved, therefore the subjects of the public policy evaluation are more public than the subjects of the institutional performance evaluation.

### The Role of Both of Them to the Other

Public policy is usually implemented by public organizations, and with a sharing of the nonprofit

**Evaluating the Institutional Performance as a Tool for Public Policy Evaluation, Table 1** The relations between evaluating public policy and institutional performance

| | Relation | Public policy evaluation | Institutional performance evaluation |
|---|---|---|---|
| 1 | The location of both of them to each other | The results of public policy evaluation during or after the implementation is already the evaluation results of the institutional performance of the implementing organizations | Evaluating the institutional performance of the implementing organizations of public policy is the main part of the public policy evaluation process |
| 2 | Goals | The goals of public policy are made and formulated in a comprehensive style, then they might be reformulated in a partial style to be implemented by some organizations | The goals of organizations are usually formulated with financial, technical, and organizational details |
| 3 | Evaluation stages | Evaluation of public policy is usually a continuous process during the policy cycle, or in some situations is a separate process at the end of the policy cycle | Evaluation of institutional performance may be a continuous process during all stages of the preparation and implementation of plans and programs, aims to control, evaluation, accountability and forecasting; it may be also at the end of the plan for managerial accountability and learning |
| 4 | Evaluation bases | Public policy is usually evaluated based on comparing the actual results of this policy by its target results, or comparing the policy results of the last period by the results of the previous periods | Institutional performance is usually evaluated based on comparing the results of the actual performance by the target results, or comparing performance results of the period by the performance results of the previous periods |

organizations and the private sector in some cases, therefore, evaluating the institutional performance of these organizations can be used in evaluating the implemented public policy.

### The Goals, Which Are the Basis of the Evaluation Process

Public policy is usually evaluated according to the public or societal goals. These goals are often difficult to be formulated quantitatively. The institutional performance is usually evaluated according to nonpublic goals which are often special and economic, even if they are linked to the goals of any policy, and they are always in a quantitative formulation to be easily measured.

### Evaluating Outputs, Outcomes, and Impacts

Evaluation of public policy is usually interested in assessing not only the outputs and outcomes of this policy but also and primarily is interested in assessing its impacts, and that the public policy is usually designed to make positive changes in the long term on the target community, but evaluation of institutional performance is interested in evaluating the outputs and outcomes more than evaluating the societal impacts, and that the stakeholders are often interested in the achieved profits more than any other objectives.

### Who Is Interested in the Evaluation

All members of the policy network are usually interested in evaluating the public policy, whether government, parliament, international organizations, civil society organizations, or others. Stakeholders and managers are interested in evaluating the institutional performance of their organizations. On the other hand, policymakers are always interested in evaluating the institutional performance of the organizations which implement the public policy.

### Indicators of Evaluation

Evaluating public policy usually depends on qualitative indicators more than quantitative indicators, but evaluating the institutional performance always depends on quantitative indicators more than the qualitative indicators.

## Evaluation Bases

Evaluation of public policy usually depends on comparing the actual results with the target results, comparing the results of a period with the results of previous periods, or comparing the actual results with the results of similar policies in other countries.

Evaluation of institutional performance usually depends on comparing the results of the actual performance with the target results,

**Evaluating the Institutional Performance as a Tool for Public Policy Evaluation, Table 2** The differences between evaluating public policies and institutional performance

| | Differences | Public policy evaluation | Institutional performance evaluation |
|---|---|---|---|
| 1 | Subjects of interest | Public policy is interested in public subjects, and its evaluation focuses on the target community and how far this policy is achieved | The institutional performance focuses just on the organization, its evaluation is just interested in the results of the organization's performance, and how far its objectives are achieved |
| 2 | The role of both of them to the other | Public policy is usually implemented by public organizations with a sharing of some nonpublic organizations | Public organizations with the sharing of some nonpublic organizations are responsible for achieving public policies, or affected by them |
| 3 | The goals, which are the basis of the evaluation process | The goals of public policy are usually public or societal goals, and it is often difficult to be formulated quantitatively | The institutional performance of any organization is usually evaluated according to its objectives, even if these objectives are linked to the goals of any policy, these objectives are often in a quantitative formula to be easily measured |
| 4 | Evaluating outputs, outcomes, and impacts | Evaluating the public policies is usually interested in assessing not only the outputs and outcomes of these policies, but also before anything impacts, these policies are usually designed to make a positive change in the long term on the target community | Evaluating the institutional performance is interested in evaluating the outputs and outcomes more than the impacts, and that stakeholders are often interested in the achieved profits more than any other objectives |
| 5 | Who is interested in the evaluation? | All members of the policy network are usually interested in the evaluation of public policy, whether government, parliament, international organizations, civil society organizations, or others | Policymakers are interested in the evaluation of the institutional performance of the organizations which implement the public policy; the other organizations are evaluated primarily for their stakeholders and managers |
| 6 | Indicators of evaluation | Evaluating public policy usually depends on qualitative indicators more than quantitative indicators | Evaluating the institutional performance usually depends on quantitative indicators more than qualitative indicators |
| 7 | Evaluation bases | Evaluation of public policy is usually based on comparing the actual results of public policy with its target results, comparing the performance results of the last period with the results of the previous periods, or comparing the policy results with the results of similar policies in other countries | Evaluation of institutional performance is usually based on comparing the results of actual performance with the target results, comparing performance results of the period with the performance results of previous periods, or comparing the results of the organization's performance with the results of its competitors |
| 8 | Evaluators | Public policy is usually evaluated by the government, legislature, stakeholders, academics, specialized advisory offices, and international or local organizations which support some policies | Evaluators of the institutional performance are different according to the nature of the organization; public organizations are usually evaluated by the government and parliament, but private organizations are usually evaluated by internal evaluators or external specialist offices |

comparing a period results with the results of previous periods, or comparing the performance results of an organization with the results of its competitors.

### Evaluators

Public policy is usually evaluated by the government, legislature, and stakeholders. It may be evaluated also by some academics, specialized advisory offices, and international or local organizations which support some policies. Evaluators of the institutional performance are different according to the nature of the organization. Public organizations are usually evaluated by the government and parliament, but private organizations are usually evaluated by internal evaluators or external specialist offices.

The differences between evaluating public policies and institutional performance can be illustrated in the following Table 2.

## Conclusion

Public policy can be achieved successfully if their goals were implemented efficiently, the efficient implementation of public policy can be done if the institutional performance of the organizations which implement the public policy was efficient. Although there are many differences between public policy evaluation and institutional performance evaluation, but there is a strong relation between them, therefore evaluating the institutional performance of the organizations which implement the public policy is a main step in evaluating it.

## Synonyms

Institutional performance; Institutional performance assessment; Performance measurement

## Definition

The contemporary changes and developments in the factors and variables that influence all types of organizations in all of the world make the evaluation of institutional performance take several directions; these evaluation directions differ according to the decision-makers' visions and the type of the evaluated organization.

## Introduction

The rapid developments in production technologies and services delivery methods, especially with the expansion of the use of digital technology and the Internet in most dealings between companies or individuals, make the institutional performance of any organization affected by many factors and variables; these factors and variables may be economic, social, or political. Nowadays, the changing nature of these multiplicity and variety factors and variables not only make the changes in the organizations' performance very fast, but also make the evaluation of the institutional performance of any organization very complex, and make the analysis and interpretation of the effect of each factor and variable very difficult.

The contemporary difficulties that any organization faces make it evaluate its performance not only to determine how far its goals were achieved, but also to determine its competitive position, and how far its performance grows from period to period. The evaluation direction and the evaluation method that will be used in evaluating the performance of any organization may be determined according to its goals and the purpose of the evaluation process.

## The Main Directions of Institutional Performance Evaluation

The difficulty of evaluating, analyzing, and interpretation of institutional performance makes the evaluation process take one or more of three main directions: goals achievement, competitive position, and performance trend.

The main directions of the institutional performance evaluation are:

## First Direction: Goals Achievement

This direction is the main direction in evaluating the institutional performance of any organization, and that every organization has goals works to achieve at a suitable time. The goals of any organization must be formulated quantitatively (if it is possible) to be measured.

Evaluators of the institutional performance compare the actual performance results with the target results to determine how far the organization is able to achieve its goals in the planned time.

The actual performance results of the organization are evaluated according to the target results by calculating the following ratio:

$$\frac{\text{Actual performance results}}{\text{Target performance results}}$$

According to this ratio, the success and failure of the organization are determined. If this ratio is close to 100%, this means that the organization succeeded in achieving its objectives. If the ratio is close to zero, this means that the organization failed in achieving its objectives.

This equation is applied not only for the total performance, but also for the partial and detailed performance, so it is mainly used in most of the institutional performance evaluation methods, especially the balanced scorecards.

The goals of any organization must not be less than the performance results of the competitors or less than the performance results of the previous periods of the organization. In some cases, public organizations set their objectives less than what they can achieve; they do that to make their actual performance better than their target performance to appear as a successful organization. This comparison also neglects the trend of the institutional performance of the organization, which may show if the institutional performance is growing or deteriorating.

Achieving goals may not mean that all the performance details have already achieved. For

example, the target productivity may be achieved, but with a high cost, or without the target satisfaction of customers.

Therefore, there are many popular evaluation methods that try to focus on one or more of the institutional performance details, for example, the balanced scorecard evaluates the institutional performance of any organization by analyzing the customer satisfaction, providing the human, organizational, technical, and marketing capabilities that are necessary for achieving the target performance, sales growth, and the increase of market share (Kaplan and Norton 1992). Benchmarking compares the performance results of the organization with the performance results of its competitors. 3E methodology analyzes the efficacy, efficiency, and effectiveness of the organization's performance.

## Second Direction: The Competitive Position

This evaluation direction is based on comparing the actual performance of the organization with the actual performance of the competitors. This comparison is one of the most important indicators used in evaluating the organization's performance. It illustrates the position of any organization among its competitors.

There are two main methods usually used in this direction:

First method: Comparing the performance results of the organization with the performance results of the competitors. Of course, the best result that can be achieved is that the performance results of the organization are better than the performance results of each competitor. If the results of the organization are worse than the results of one or more of the competitors, evaluators must determine the aspects and the causes of excellence in each organization; also they must identify the deficiencies in the organization's performance related to the performance of its competitors, reasons of deficiencies, and how to treat with these deficiencies.

The evaluation process in this method depends on the following two ratios:

The first ratio is used to evaluate the total performance results of the organization compared to the total performance results of each competitor, rather than the detailed performance. This ratio provides an immediate result for the stakeholders about the extent of the organization's superiority over its competitors. It is usually calculated before the second ratio which shows the detailed performance results of the organization, and it illustrates the strengths and weaknesses in the organization's performance compared to the performance of its competitors.

$$\frac{\text{Total performance results of the organization}}{\text{Total performance results of the competitors}}$$

The second ratio is used to evaluate the detailed performance of the organization, which illustrates the position of the partial performance of a process, section, or branch, compared to the performance of the same part in the competitors' organizations separately. This ratio usually needs more analysis than the first ratio to detect the technical causes of the positive or negative deviation between the organization and its competitors, identifying sources of strength to support and sources of weakness to treat.

$$\frac{\text{The partial performance results of the organization}}{\text{The partial performance results of the competitors}}$$

Second method: Determining the market share of the organization in the market of the product it provides, and determine the extent of its growth or deterioration.

The ratio of the market share of the organization can be determined by the following equation:

$$\frac{\text{The market share of the organization}}{\text{Total market share of the product}}$$

This ratio can be used not only for the outputs, but also for the outcomes and impacts if possible, and according to the specification of the product offered by the organization.

The increase or decrease in the market share of the organization can be determined by analyzing its time series, thus determining the development or deterioration of the organization's performance compared to its competitors' performance. If there is not any change in the market size, any increase in the market share of the organization is a result of a decrease in the market share of one or more of the competitors, also any decrease in the market share of the organization causes an increase in the market share of one or more of the competitors.

This comparison is not useful if the organization achieved the maximum amount of production by its maximum capacity of resources, which the organization cannot achieve more than these results, and it has already achieved its main goal. This comparison also does not focus on the performance trend of the organization.

Benchmarking is one of the popular institutional performance methods which is compatible with this direction; it evaluates the institutional performance of any organization by comparing its performance results with its competitors' performance results.

In the evaluation process, the evaluated organization must not only focus on the total performance results or its competitive position, but also focuses on all the performance details, that any organization has to work to be the best not only in the total performance results but also to be the best in all the performance details.

## Third Direction: The Performance Trend

This evaluation direction based on comparing the organization's performance results in the period under evaluation with the performance results in the previous periods. It is one of the most popular evaluation methods, especially in financial evaluation. If the performance results of the period under evaluation are better than the results of previous periods, this indicates that there is a growth in the organization's performance. Also if the performance results of the period under evaluation are worse than the results of the previous periods, this indicates that there is a deterioration in the organization's performance.

This method of evaluation differs from case to case. Some evaluators compare the performance results of the period under evaluation only with the results of the last period. Other evaluators compare the results of the performance of the period under evaluation with all the previous periods or with a part of them. The periods that will be compared with the period under evaluation are determined according to the vision of the evaluators or stakeholders. In this comparison, the best result that can be achieved is that the performance results of the period under evaluation are better than the performance results of all the previous periods.

Any kind of organization (business, nonprofit, or governmental) usually aims to make its performance results grow in a positive trend. In some cases, the target performance results may be less than the previous results, this may due to public economic reasons, financial reasons, or any negative change in one or more of the correlated variables that make the organization expect a decrease in the results of its future performance.

## The Most Used Methods for Evaluating Institutional Performance

### The Balanced Scorecard

The balanced scorecard is one of the most used methods in evaluating the institutional performance; it depends on four perspectives:

1. Customer perspective

   Customers satisfaction can be evaluated by measuring the following main elements:
   - Time, by measuring the time required for the company to meet the customers' needs
   - Quality, by measuring how far the customers are satisfied the quality of the product or service

- Performance and service, by determining how far the organization's products or services create value for the customers
- Cost, by determining how far the prices of the products or services are satisfied by the customers

2. Internal business perspective

   Customer satisfaction needs continuous evaluation for the internal processes that affect this satisfaction, like critical technology modernization, manufacturing excellence, design productivity, current product development, and new product creation.

3. Financial perspective

   Financial performance measures indicate how far the organization's strategy contributes to achieving the organization's goals. That needs to measure profitability, growth, and shareholder value. Financial performance can be measured by cash flow, quarterly sales growth, operating income, market share, return on equity, and shareholder value analysis which forecasts future cash flows and tries to make the financial analysis more forward looking.

4. Innovation and learning perspective (Kapalan and Norton 2001)

   The value of an organization is measured by its ability to innovate new products, improve and develop the current products, create more value for customers, improve operating efficiencies, penetrate new markets, and increase revenues and shareholders' value.

   The balanced scorecard is used also as a strategic planning system by following four steps:

   1. Translating the organization's vision by clarifying it and gaining consensus
   2. Communicating by educating and setting goals, and linking rewards to performance measures
   3. Business planning by setting targets, aligning strategic initiatives, allocating resources, and establishing milestones
   4. Feedback and learning by articulating the shared visions, supplying the strategic feedback, and facilitating strategy review and learning

**Benchmarking**

Benchmarking is one of the most used methods in evaluating institutional performance (Bhutta and Huq 1999). The main purpose of benchmarking is to determine the gap between the organization's performance and the best levels of performance in the other compatible organizations, to improve the organization's performance to the best possible level. The compared organizations may be from the organization's competitors or other similar organizations.

Benchmarking focuses not only on the performance results, but also focuses on all the performance details as the operating processes and organizational performance.

Benchmarking usually consists of five steps:

Step 1: Planning the evaluation

In this step, decision-makers determine what will be benchmarked and how.

Step 2: Forming the benchmarking team

This step contains the formation of the benchmarking team who prepares a plan that includes the team member's roles and responsibilities, the benchmarking time, defining the processes that will be benchmarked, and determining the performance measures.

Step 3: Identifying competitors

The benchmarking team determines the benchmarking organizations that achieved the best performance indicators.

Step 4: Information collection and analysis

The purpose of collecting and analyzing data in a benchmarking is not only determining the gap between the organization's performance and the other organizations which are better in their performance but also understanding how they achieve their best performance.

Step 5: Adapting and improving the performance with the best practices

The benchmarking cannot be used only with business organizations by determining the gap between the organization's performance and its competitors' performance but also can be used with the nonprofit organizations by determining the gap between the performance of a nonprofit organization and the performance of the other organizations that work in the same

field, and can also be used with the governmental institutions by determining the gap between the performance of a governmental institution and the similar institutions in other countries.

### 3E Methodology

3E is one of the main methodologies used in evaluating the institutional performance; it evaluates the performance of any organization by measuring three elements:

1. Efficacy, by measuring how far the organization actually produces the target outputs
2. Efficiency, by measuring how far the organization produces the target outputs using the possible minimum amount of resources
3. Effectiveness, by measuring how far the outputs are appropriate for the wider system and the organization's environment

3E methodology consists of the following five steps:

1. Identifying the organization's goals. That is done by the discussion among the stakeholders. The target of each activity and the target of each period in the plan need to be determined too.
2. Identifying the details of each activity.
3. Identifying the performance indicators of each activity and subactivity.
4. Repeating the second and third steps until all the activities' indicators are satisfied.
5. Classifying the activities' indicators according to the evaluation goals.

Efficacy, efficiency, and effectiveness are different according to the nature of the organization, for example, the outputs of the business organizations which work to achieve economic goals are often evaluated by financial indicators, but the impacts of the nonprofit organizations which usually work to achieve community goals are often evaluated by social indicators.

The type of organization, whether it is business, nonprofit, or governmental, determines the direction and the method in which it will be evaluated.

### EFQM (The European Foundation for Quality Management)

EFQM is a model for managing the quality of the institutional performance and achieving the organization's goals by defining its purpose, creating its vision, developing its strategy that creates a sustainable value, and building an aspirant culture linked with its environment (Nenadál 2020).

The institutional performance is evaluated in the EFQM model by measuring the following elements:

1. Purpose achievement
2. The sustained value that the stakeholders gained
3. The achieved contributions and positive impacts on the organization environment
4. Creation and innovation were enabled
5. The effect of the past and current performances on future performance

The EFQM model uses both financial and nonfinancial indicators to evaluate the strategic and operational performance of any organization. It works to link the stakeholder goals and the actual performance, interprets the causes and relationships that affect the performance, and uses the current results to predict the future performance.

## Evaluating the Future Impacts of the Current Institutional Performance

Fast changes in the multiple and varied factors and variables that affect the institutional performance of any kind of organization make the evaluators of this performance may not only interest in the current effects of these factors and variables but also interest in their future impacts to be considered in the future plans.

The most usable methods in evaluating the institutional performance do not interest in evaluating the future impacts of the current performance results. For example, the balanced scorecard is interested in the future dimension of the performance evaluation in the innovation and learning perspective, by the continuous improvement for the current products and processes, and

the ability to introduce new products with expanded capabilities (Kaplan and Norton 1992). This illustrates that the balanced scorecard evaluates the institutional performance to improve it in the future, not to determine the deviation between the expected performance (based on the current performance results) and the planned performance to correct or support it.

Benchmarking evaluates the institutional performance by the comparison between the organization's performance and the competitors' performance, or any other standards to improve the performance of the organization (Camp 1989), but it is not interested in identifying the future impacts of the current performance. The 3E methodology focuses only on measuring the efficacy, efficiency, and effectiveness (Liu 2009). It is not interested in identifying the future impacts of the current performance.

Sometimes, the current results of the institutional performance may be equal to the planned performance, but the time series analysis of the performance results may show that there is a deviation between the expected performance results and the planned results. If the expected results based on the time series are less than the planned performance results, decision-makers have to treat the causes of the deviation, but if the expected results based on the time series are more than the planned performance results, decision-makers have to support the causes of the deviation.

The fast changes in the factors and variables related to the evaluated organizations make the evaluation of plans periodically very necessary to develop them according to these changes.

## Conclusion

The successive developments in production technologies and the methods of service delivery, and the expansion in using the digital technology and the Internet by most companies and persons, make the changes in the factors and variables that affect the performance of any kind of organization very fast. All these fast changes make the evaluation of any organization's performance take one of three main directions: goals achievement, competitive position, and performance trend.

According to the organization's goals, type of organization (business, nonprofit, or governmental), and the evaluation objectives, decision-makers and stakeholders follow one or more of the three main directions in evaluating the institutional performance by using one of the trusted evaluation methods, like the balanced scorecard, benchmarking, 3E methodology, or EFQM.

The contemporary developments that influence the institutional performance make the organization need not only to determine how far the current performance achieves the periodical objectives of the organization, but it also needs to predict the impacts of the current performance on the future performance to avoid the negative impacts and support the positive impacts.

## Synonyms

Assessment; Citizen engagement; Citizen participation; Civic engagement

## Definition

Public participation is defined as the structured involvement of citizens in planning and policy-making processes by offering participation instruments. Evaluation can be understood as the systematic assessment of such instruments and includes its process as well as its outcomes.

## Introduction

In the last 30 years, the currently dominant mode of public policy-making in liberal democracies has increasingly come under scrutiny. The symptoms are manifold: Electoral turnout is declining in many countries, citizens are claiming more say in planning and decision-making, and policy-makers face public protest when implementing large infrastructure projects. What's more, public budgets are often notoriously under stress. In consequence, some political commentators are even diagnosing a legitimacy crisis of liberal democracy. It is therefore not surprising that political analysts and policy-makers are searching for a remedy as a matter of urgency.

Within democratic theory and the literature on reforming democracy and public administration, one such remedy is seen in citizen participation (Smith 2009, p. 4; see the article on *public participation* in this volume). These authors often champion the implementation of various participation instruments aimed at making public governance and policy-making more effective and efficient and fostering input and output legitimacy (Papadopoulos and Warin 2007). In addition, such instruments are said to be beneficial for increasing civic education and social capital (Geissel 2012, p. 169).

However, such high theoretical expectations must be confronted with rigorous empirical evidence. Put differently, like every policy instrument, citizen participation tools should be evaluated (see the article on *program evaluation* in this volume). Evaluation is important for several reasons (e.g., Abelson and Gauvin 2006, p. 3; Bryson et al. 2013, pp. 30–31; Rowe and Frewer 2004, p. 516): First, it helps to figure out if instruments work and if their goals were fulfilled; second, it identifies strengths and weaknesses to improve instruments in the future. Third, because participation instruments require public resources, evaluation contributes to accountability about reasonable use of these resources. Fourth, it is a chance to put the often value-laden debate about citizen participation on empirical ground, which might lessen conflicts between stakeholders. And finally, evaluation provides evidence to theoretical discussions in political science and public administration.

Not surprisingly, academics and practitioners in politics and administration are pondering about proper evaluation designs. Who should be in charge of the evaluation, which criteria could be used to assess public participation instruments, and which empirical methods might be applied? Against the background of notoriously scarce resources in many states and municipalities, such questions are not trivial. Should they quickly apply a checklist-type toolkit or hire academic or commercial researchers? This chapter seeks to answer these questions in a concise manner, summarizing key contributions. It is aimed at

academic researchers working in the fields of political science and public administration as well as at practitioners facing challenges with the evaluation of specific instruments. For the sake of simplicity, all explanations apply to single participation instruments (e.g., public hearings) as well as complex programs (e.g., participatory budgeting).

## Citizen Participation: A Brief Overview

Increasing citizen participation in liberal democracies has been on the agenda since the late 1960s. Proponents of participatory democratic theory have been critical of the established practice in many liberal democracies, which they accuse of fostering political ignorance and apathy. They have argued for increased citizen involvement in planning and decision-making processes. Other authors have stressed the importance of deliberation. However, the topic has only gained momentum since the 1990s. As a reaction to the crisis symptoms mentioned in the introduction, many government officials at different levels of the political system have begun to experiment with a diverse set of participation instruments. These can be understood as "initiatives in which sponsors acquire some form of public input" (Rowe and Frewer 2004, p. 515) in a purposive and structured manner. Officials were encouraged by demands from political parties, civil society organizations, and think tanks. The local level in particular often serves as an experimental laboratory. When considered as successful, an instrument might be implemented at a higher level of a given political system (e.g., from local to the federal level). Apparently, evaluation seems beneficial for justifying such decisions.

Some instruments focus on narrow policy issues (e.g., a decision on the location of a waste disposal site), while others are relevant to one or more policy areas or even the whole (municipal, federal) budget. Their goals are manifold: obtaining feedback on policies, generating ideas, identifying problems, and solving conflicts, among others (Nabatchi 2012, p. 10). Secondary aims are educating citizens, fostering policy acceptance, and building social capital (e.g., Geissel 2012, p. 169). Popular instruments are, for instance, deliberative polls, participatory budgeting, and citizen juries but also forms of direct democracy (e.g., Smith 2009, pp. 111–141). Often, these instruments are imported from other regions of the world, where they were developed or have been in use for a while. For instance, participatory budgeting was developed in Porto Alegre, Brazil, at the end of the 1980s and subsequently traveled the world. Some older contributions report about 100 instruments (Rowe and Frewer 2005, pp. 256–257). Presumably, the number has risen since then. What's more, the chances are high that different labels are used for similar instruments.

To reduce complexity, several typologies of citizen participation instruments were introduced, ranging from rating primarily the degree of citizen influence to multiple dimensions (e.g., Geissel 2012; Rowe and Frewer 2005; Nabatchi 2012, p. 7 provides a brief overview of relevant factors). At this point, they do not need to be summarized in detail, but a few aspects should be considered when evaluating participation instruments. This stems from the fact that the dimensions partly determine what to look for, i.e., which evaluation criteria are reasonable, and which research methods might be applied.

First, it is important to differentiate between consultative and binding participation instruments. Whether the citizens of a neighborhood, city, region, or a whole country only have the chance to express an opinion and ideas or whether they influence binding decisions matters for evaluation. For the latter, socially and politically biased participation might be a weightier concern than for consultative procedures. This is due to higher stakes for the parties involved. Imagine, to give a slightly exaggerated example, that wealthy citizens of a city control the decision on the location for a new nuclear plant and the plant is subsequently built next to the poorest district – this would be an instance of the NIMBY phenomenon ("not in my backyard").

Second, the form of participation should be taken into account as it partly predetermines evaluation criteria and methods. For instance, the

criterium "quality of deliberation" is redundant when citizens merely submit and rate budget proposals in participatory budgeting without the opportunity of discussing them. This aspect also encompasses differences between instruments for small (e.g., citizen jury) and large groups (e.g., some variants of participatory budgeting). Obviously, for small group instruments, other research methods might be applied than for a large-scale instrument – for example, in-depth interviewing and participant observation in the evaluation of a citizen jury versus a standardized survey of all registered users of online participatory budgeting.

Third, the time horizon of a participation instrument is relevant. For example, one-shot instruments often only allow for summative evaluation. Instruments or programs with a longer duration, in contrast, provide chances for formative approaches, in particular, when a repeated use is planned. In these cases, permanent feedback is given during the participation process and afterward to improve the instrument along the way as well as in future runs. Of course, in this case, an instrument's impact must not be neglected.

## The Role of the Evaluator

Before thinking about a proper evaluation design, the first crucial question is who should evaluate a participation instrument: the sponsor (e.g., municipal administration, local council) or external personnel (e.g., academic researchers, consultants)? Internal evaluation, on the one hand, requires fewer financial resources, although the workload for internal staff should not be underestimated. Additionally, internal staff members are more familiar with an instrument and its context than external researchers. On the other hand, internal evaluation may suffer from organizational blindness.

External evaluators, in contrast, are costly but provide an unbiased and ideally comparative view. If resources are available, external evaluation is therefore preferable. Both, however, must apply social research methods. Informal evaluation based on unstructured subjective impressions, although often applied in practice, is not recommended since this approach is prone to biased judgments (Rossi et al. 2004, p. 269). To illustrate: if the expectations are high, subjective impressions might bring forward overtly positive judgments while negative aspects are easily dismissed.

Participatory and deliberative approaches are a special form of evaluation. In the case of participant-driven evaluation, citizens conduct the research themselves – they develop criteria, do the fieldwork, and formulate conclusions and recommendations (e.g., Evans and Jones 2004; House and Howe 2002). Within this approach, there is still room for a professional evaluator but only to enable, moderate, and advise (Evans and Jones 2004, p. 9). However, "[i]n this conception, the evaluator is not a passive bystander, an innocent facilitator, or a philosopher king who makes decisions for others, but rather a conscientious professional who adheres to a set of defensible, carefully considered principles for enhancing inclusion, dialogue, and deliberation" (House and Howe 2002, pp. 410–411). Furthermore, it is possible to differentiate between participatory evaluations based on its internal or external character. In the case of internal evaluation, the participants conduct the evaluation in cooperation with sponsors or staff. In the case of external evaluation, citizens participate in evaluation processes conducted by external evaluators. Figure 1 summarizes the evaluation approaches discussed in this section.

## Processes and Outcomes

A thorough evaluation comprises process and outcomes as well as the possible impacts of an instrument (Geissel 2012, p. 167; Rossi et al. 2004, p. 235). Although many (evaluation) studies – often due to lack of resources and time pressure – only focus on the process, outcomes and impacts should not be neglected (Rowe and Frewer 2004, p. 520). Crucially, a proper design and well-run process do not necessarily go along with reaching the intended goals but nevertheless might be conducive (Bryson et al. 2013; Chess and Purcell 1999, p. 2690).

**Evaluation of Public Participation, Fig. 1** Forms of systematic evaluation and the influence of different groups of actors on its conception. (Source: Based on Busse and Schneider (2015, p. 6))

*Process* concerns, in essence, the design and implementation of an instrument. The key question is how does an instrument work? For many evaluation studies, this is bread-and-butter business. In this regard, it is also important to ascertain its embedding in a particular policy domain. For example, an evaluation of participatory budgeting might investigate its connection to the usual budget cycle in a municipality. If participatory budgeting is run separately, this might help to explain negative evaluation results, such as redundant citizens' proposals or lack of policy impact.

*Outcomes and impacts*, in simplified terms, can be subdivided into outcomes and impacts on policies, on citizens and general public, and on political and administrative decision-makers (Abelson and Gauvin 2006, pp. 16–18; for a more detailed account, see Bryson et al. 2013, p. 30). Put simply, outcomes are the measurable effects of a program (Rossi et al. 2004, p. 240). In the context of citizen participation, an intended outcome might be increasing the number of citizens involved in a municipality's budget process. In contrast, impacts encompass the broader organizational or societal changes induced by a program. They are often more subjective and more prone to the influence of external variables. Related to citizen participation, the intended impact could be a more politically involved and active citizenry. Impacts often combine several outcomes.

However, assessing outcomes and impacts usually needs more complex evaluation designs as well as a longer time span for the evaluation since they often emerge after the participation process is finished (Geissel 2012, p. 167). Moreover, questions of causal contribution and attribution are not trivial (e.g., Rossi et al. 2004, pp. 241–244). Since there is usually no control group – imagine finding a virtually identical municipality *not* utilizing the same participation instrument – it is often hard to determine whether an instrument made a difference or whether the outcome or impact was caused by an external factor (Chess and Purcell 1999, p. 2685). To illustrate, in some cases, citizen participation is misused to provide additional legitimization for a decision already made by the local council (e.g., a large infrastructure project). Or, to give another stylized example, social or environmental improvements are determined by general trends instead of by a new action plan developed in a deliberative forum.

## Formative and Summative Evaluation

The evaluation literature differentiates between formative and summative evaluation (e.g., Rossi et al. 2004, p. 40). Related to citizen participation, formative evaluations address the improvement and optimization of participation instruments. For example, they might be aimed at making online platforms more user-friendly or show sponsors ways to reach more participants. Summative evaluations assess whether an instrument fulfilled its goals. These can be goals defined by the initiator (e.g., generating ideas or finding a solution for a particular issue) or goals derived from the literature on citizen participation. In practice, studies often mix both approaches.

Furthermore, formative and summative evaluation must not be confused with process and outcome evaluation. It is possible to assess processes and outcomes to learn and improve an instrument as well as to figure out whether an instrument fulfills its goals in terms of process and outcomes.

## Perspectives on Evaluation Criteria

Arguably the biggest challenge for evaluating participation instruments is establishing proper evaluation criteria. Despite being on the agenda of researchers and practitioners for at least 40 years (e.g., Sewell and Phillips 1979), generally agreed criteria do not exist (Rowe and Frewer 2004, p. 516). Two major approaches are found in evaluation studies: theory-based criteria and criteria based on participants' goals and satisfaction ("user-based evaluation") (Chess and Purcell 1999, p. 2686). Many evaluation studies conducted by academic researchers, consultancy firms, or municipal administrations, however, use a hands-on approach, implicitly combining aspects from democratic theory and the public policy literature with satisfaction and usability. In this chapter, it is argued that a comprehensive evaluation needs both (Chess and Purcell 1999, p. 2686) but also should not neglect the context of a participation instrument (Abelson and Gauvin 2006, p. 16).

Political scientists often apply a democratic theory framework, directly or indirectly emphasizing input, throughput, and output legitimacy. For instance, Papadopoulos and Warin (2007) use the four dimensions: *openness and access*, *quality of deliberation*, *efficiency and effectiveness*, *publicity*, *and accountability*, while Geissel (2012) opts for *input legitimacy*, *democratic process*, *effectiveness*, and *civic education*. However, except for the last dimension, the dimensions are virtually identical.

Scholars working in the field of public administration, as well as practitioners, tend to follow a less normative approach. They often focus on process design (e.g., Bryson et al. 2013), with an emphasis on criteria such as *participant satisfaction*, *quality of the results*, and the *cost-effectiveness ratio* of an instrument. Even more than in the case of evaluation frameworks with a normative basis, enabling factors in the form of technical parameters (e.g., characteristics of online platforms, such as *accessibility* or *user-friendliness*) are taken into account.

## Evaluation Criteria: A Synthesis

The following section summarizes and synthesizes key criteria found in the existing literature. Put simply, it seeks to answer the question of what to look for in evaluations of participation instruments. The section does not provide a method for summing up assessed criteria and forming an overall judgment, however.

To start with, the criteria applied must necessarily reflect an instrument's own standards. Every instrument is developed and implemented with one or more goals in mind, typically formulated by the sponsors. For instance, if an instrument is aimed at mobilizing previously inactive citizens to become politically involved, an evaluation should address this goal. In terms of evaluation language: a *program theory*, *logframe*, *theory of change*, or *theory of action* is needed (e.g., Chen 2015, chapter 3; Rossi et al. 2004, chapter 5) – what are an instrument's goals, and how should they be achieved? However, an evaluation needs to go further and rigorously assess

context, process, and outcomes. Ideally, an instrument's goals are integrated into a broader set of evaluation criteria. Table 1 presents major evaluation criteria in each of the three dimensions, along with potential enabling factors. However, despite covering major aspects, the table is not exhaustive. Evaluators might adapt criteria and enabling factors according to their program theory. Nevertheless, using established evaluation frameworks could enhance comparability of studies across contexts but also across participation instruments, which might help in achieving a better understanding of the determinants of success and failure of citizen participation.

*Context:* In the context dimension, a look at the situation in a given municipality and specific policy field is in order. Abelson and Gauvin (2006, p. 31) show that many evaluation studies in the field of citizen participation neglect context although information on local characteristics is relevant to decision-makers. This is especially true when a study aims to provide generalizations to other contexts. To give a stylized example, in an evaluation of participatory budgeting, investigators could examine the financial situation of a municipality and the positions of major actors (e.g., mayor, political parties). This, in turn, might help to put process and outcomes into

**Evaluation of Public Participation, Table 1** Evaluation criteria: an overview

| Dimension | Subdimension | Criteria | Enabling factors | Remarks |
|---|---|---|---|---|
| Context | – | – | Support of officials (e.g., politicians, public administration) | Financial situation in a given context might influence participation processes (e.g., distribution conflicts) |
| | | | Contextual constraints (e.g., legal, social, political, financial)? | |
| Process | Organization | Relation of efforts to results *(efficiency, cost-effectiveness)* | Financial and personnel resources | Efficiency is presumably the most challenging criterium |
| | Participants and access | Number and composition of participants (e.g., sociodemographic, political) *(inclusiveness)* | Mobilization | Biased participation is often immanent to public participation processes |
| | | | Accessibility | |
| | | | Design (functionality and user-friendliness | |
| | Process and results | Quality of deliberation | Transparency about goals, rules, and timeframe | For measuring quality of deliberation, see, e.g., Steenbergen et al. (2003) |
| | | Quality of results | | |
| | | | Provision of relevant information about issue/policy field | |
| | | | Moderation | |
| Outcomes and impacts | Actors (political, administrative, civil society) and policy | Goals fulfilled *(effectiveness)* | – | Goals might be conflicting |
| | | Participant satisfaction (process and results) | | A good process design does not guarantee goal fulfillment |
| | | Policy impact | | |
| | | Civic education and social capital | | |

The table is based on the work of Abelson and Gauvin (2006) and Kubicek et al. (2011) and is taken, expanded, and partially modified from Schneider and Busse (2018, p. 5)

perspective. For instance, why do conflicts between stakeholders emerge during the process, and why do particular citizens' budget proposal prevail while others do not? Such information enables actors in other contexts to figure out if a particular instrument is suited for their own purposes.

Evaluators might pay attention to the institutional embedding (e.g., the influence of federal or national level on municipalities), political constellations (e.g., majorities in local council), and financial situation (e.g., debts) in the municipality under scrutiny. Apart from such rather manifest context characteristics, a crucial question is whether public officials support a participation instrument. Are they supportive, or do they publicly criticize it? Apparently, it takes more effort to elicit valid and reliable information since official actors might be prone to give lip service to the importance of citizen participation in public while at the same time not being fully committed to the instrument in their everyday business.

*Process:* The number and the socio-demographic and political composition of participants are very basic evaluation criteria in the process domain (Rowe and Frewer 2000, pp. 12–13). From a political science perspective, this taps into the discussion about inclusiveness or input legitimacy (Papadopoulos and Warin 2007, pp. 455–456; Smith 2009, pp. 22–22). If the composition is heavily biased socially or politically, i.e., not representative of the general population in a municipality, legitimacy is debatable, especially when an instrument produces binding results. In this regard, relevant enabling factors are mobilization, accessibility, and user-friendliness. Evaluators may investigate which measures were taken to mobilize citizens (e.g., press conferences, social media campaigns, direct mailing) and how accessible and user-friendly the instrument is. For example, an impression the authors have from their research on participatory budgeting in Germany is that public officials rarely promote participation opportunities (Schneider and Busse 2018). Moreover, most potential participants are not aware of the relevant online platforms or citizens' forums, which are sometimes hard to find. In combination with the low stakes for citizens due to non-binding results, it is hardly surprising, therefore, that the number of participants in German participatory budgeting processes is usually low.

The quality of deliberation and results must then be addressed. As mentioned elsewhere, this depends on the availability of opportunities for discussions. In terms of deliberation, first of all, fairness is a crucial aspect: Did all participants have the chance to express their views (e.g., Webler 1995)? However, quality of deliberation encompasses more than just equal opportunities. For instance, in the Discourse Quality Index, the *absence of interruption*, *level and content of justification*, mutual *respect*, and *constructiveness* are further key indicators (Steenbergen et al. 2003). In addition, it is important that instruments are truly independent (Rowe and Frewer 2000, pp. 13–14). In particular, attempts to manipulate and steer participants' opinion in a certain direction, either by public officials or interest groups, are considered a serious threat.

Next in the process domain is quality of results. Analogous to the user-based approach to evaluation (Rosener 1981), a thorough evaluation needs to consider quality from different stakeholders' angles (e.g., citizens, public officials, interest groups). Results and their quality provide potential for conflicts between different stakeholders (Creighton 2005, p. 218). Since consensus seems illusory for many issues, evaluation may not resolve disputes – but it might help to make them transparent.

Enabling factors related to quality of deliberation and results include transparency about an instrument's goals and rules, sufficient provision of relevant information about the issue or policy field at stake, and moderation of participation processes (see also Rowe and Frewer 2000, pp. 15–17; Webler 1995). For a more detailed account of designing guidelines to ensure success of public participation processes, see, for example, Bryson et al. (2013).

Presumably the most complicated aspect to evaluate is the cost-effectiveness ratio, in other words the *efficiency* of an instrument (e.g., Beierle 1999, p. 87; Rowe and Frewer 2000, p. 17). Rossi et al. (2004, p. 366) differentiate between

*cost-benefit* and *cost-effectiveness* analysis: "in cost-benefit analyses, the outcomes of programs are expressed in monetary terms; in cost-effectiveness analyses, outcomes are expressed in substantive terms." In this chapter, it is assumed that cost-benefit analysis is not meaningful in the evaluation of participation instruments. The focus is therefore on cost-effectiveness. That is because a quantitative comparison with identical procedures in similar contexts is often impossible. Evaluators must therefore rely on the qualitative inspection of used resources (e.g., finances, time, and personnel) and consider if there are indications of inefficiency or improvement (Nabatchi 2012, p. 29). Moreover, the sponsors might provide hints at the reasonable use of public resources. However, this approach is apparently prone to biased judgments. Future research, therefore, could address the issue of efficiency in greater detail. Comparative evaluation studies are urgently needed since most of the time participation instruments are initiated by public institutions, which means they are state-funded. This requires the efficient use of public resources.

In terms of *outcomes and impact,* the focal point, especially from the sponsors' perspective, should be an instrument's own goals first of all. These goals can be manifold, ranging from incorporating citizens' views into policy-making and restoring trust in public agencies to making public policy more effective and efficient (e.g., Abelson and Gauvin 2006, p. 9; Rowe and Frewer 2004). Due to this heterogeneity, no specific recommendations can be given here.

Second, depending on the mandate and resources, it might be feasible to apply a broader set of more general criteria, as utilized in political science (e.g., Geissel 2012; Papadopoulos and Warin 2007) or the social goals approach (Beierle 1999). This would avoid an overly idiosyncratic setup and increase opportunities for comparison between different contexts or instruments. On the one hand, this might benefit academic progress and general policy learning on the other.

Third, as in the user-based approach to evaluation (Rosener 1981), participant satisfaction is an important measure. Some authors put satisfaction under the heading *process* (e.g., Abelson and Gauvin 2006, p. 8). However, the perspective championed here is that instruments, i.e., their sponsors, want to see satisfied users. Satisfaction is therefore considered as an outcome. Nevertheless, it might simultaneously serve as a proxy for the quality of deliberation and results. This holds true for cases when available resources (or a lack thereof) do not allow for an in-depth analysis via content analysis of discussions and questionnaires. In contrast, satisfaction of public officials is irrelevant here. Rather, it is a process criterion.

Fourth, evaluations can point out instances of unintended outcomes and impacts, which can be disadvantageous as well as beneficial. For example, if participation results are not considered by sponsors, this can lead to frustration within the citizenry and to even lower participation rates in the future. By contrast, positive experience with an instrument can lead to a "participatory spillover" and hence to a broader use of participative instruments in the future. This also shows that relying solely on the instruments' own goals is almost never sufficient. Since they are mostly formulated by sponsors who cannot foresee every possible outcome that might go along with the use of certain instruments, it is the evaluator's duty to examine possible unintended outcomes and impacts.

## A Few Words on Fieldwork

At this point, it is assumed that the reader is familiar with the conventional research process in evaluation research (for details, see Nabatchi 2012, pp. 17–20). In general, all established quantitative and qualitative social science research methods are applicable in evaluating citizen participation instruments. This section therefore merely touches on a few important topics regarding fieldwork.

First, from the perspective of validity and causal inference, a sophisticated research design is desirable to rule out alternative influences on outcomes. For instance, field experiments and panel surveys are suitable for this endeavor

(e.g., Rossi et al. 2004, chapters 8 and 9). However, the extent of fieldwork depends on available resources and must be in direct proportion to the scope of the participation instrument under investigation. Setting up a fully fledged randomized controlled trial to evaluate one single public hearing on the color of a park bench (see Fung 2015, p. 9 for the "triviality issue") misses the point – especially against the background that an evaluation itself requires public resources which could be used for other purposes. For such small-scale instruments, some form of self-evaluation might be suitable. In this regard, evaluation methods must give priority to usefulness accompanied by reliability and validity instead of boasting about sophisticated methodology. In any case, results ought to be presented in a way that an audience not trained in research methods and statistics can understand.

Second, the views of all stakeholder groups must be considered. This also holds true for smaller instruments mentioned above. The empirical approach, however, is partly determined by the design of a participation instrument or program. For example, to evaluate a citizen jury consisting of, let's say, eight people, qualitative interviews or a focus group discussion including sponsors (e.g., public officials) is manageable. For a large-scale participatory budgeting project combining several participation modes, a large-N survey is recommended. Given that policy issues are often contested, including the perspective of all relevant actors helps to identify potential conflicts, which in turn helps in understanding success and failure of an instrument. In practice, this often means utilizing several research methods (e.g., a survey, expert interviews, and content analysis) and triangulating data.

## Challenges and Opportunities for Evaluation of Citizen Participation

By this point, it should have become clear that evaluation of citizen participation on the one hand often faces several challenges but on the other hand still has plenty of potential for progress. A first challenge is to define success, which presumably varies between stakeholder groups. For instance, government officials might seek support for their intended policy while interest groups aim to thwart these plans. What's more, evaluation criteria or an instrument's goals can easily conflict. An example often mentioned is that there are trade-offs between including as many citizens as possible and ensuring a sufficient quality of deliberation. A researcher must therefore take all stakeholders' perspectives into consideration and make clear which criteria will be applied. If the aim is to offer an overall judgment, transparency about weighting multiple criteria is advisable. However, the current literature does not provide any hints on the importance of individual criteria.

Second, the focus of future evaluation studies should be on enabling factors or, in other words, "causal mechanisms." To take, once again, participatory budgeting in Germany as an example, most studies describe process and outcomes but rarely discuss and investigate mechanisms that are responsible for success and failure (Schneider and Busse 2018). The standard evaluation often asks, "Does instrument *X* lead to *Y*?" However, building on the literature on *realist evaluation* (Pawson and Tilley 1997, p. 66), it is fruitful to derive potential mechanisms from theory and relate them to an instrument's context. In a nutshell, mechanisms help in moving beyond the question whether an instrument works and helps answer questions on "how" and "why" instruments bring about certain effects. This is beneficial for academic research as well as for practitioners. In particular, the latter might gather information on how to design and adjust their participation instruments.

To further illustrate this by using a stylized example, participatory budgeting often aims to mobilize politically disengaged citizens. Promotors try to increase awareness and self-efficacy among citizens, for instance, by providing information on the budget process and explaining how to formulate and submit a proposal. However, this mechanism depends on the context – in deprived areas, people might not have the necessary resources to participate. In other words, participatory budgeting only reaches people who are already politically involved.

Third, a general problem is that evaluation studies, almost without exception, analyze a single case. However, to allow for valid causal inferences on crucial factors shaping success and failure, i.e., understanding the causal mechanisms mentioned in the preceding paragraph, a comparative design is the only way out. Admittedly, this approach is often illusory for single sponsors (e.g., a municipality) due to resource constraints. Thus, a reasonable solution is cooperation between sponsoring institutions and academic researchers to set up larger comparative projects. For example, an evaluation might be linked to PhD projects since data could be used for multiple purposes (for an example, see Schneider 2018, p. 165–166).

Finally, systematic reviews and meta-analysis are worthwhile research endeavors (e.g., campbellcollaboration.org), particularly when comparative evaluations cannot be conducted. Findings from qualitative or quantitative single-case evaluation studies are coded, harmonized, and merged in a spreadsheet, linked with information on an instrument's design and contextual data (e.g., political and financial). This allows inferences to be drawn on the effects of design and context on success and failure (e.g., Geissel and Hess 2017). However, two caveats need special attention. First, by design this approach hardly provides advice for the improvement of particular cases or instruments. Second, it is often painstaking to get access to a sufficient number of evaluation studies; few have been published in academic journals. A subjective impression is that evidence of failure is kept under lock and key. However, these cases may be of greater importance for evaluating citizen participation instruments than focusing purely on best practice cases. Sponsors of evaluation studies are therefore encouraged to publish the reports or at least give researchers access.

## Concluding Remarks

At a time when the popularity of citizen participation instruments is increasing, the demand for evaluation is rising accordingly. This is hardly a surprise since such instruments and programs require public resources. If government is striving for evidence-based policy-making, theoretical-normative assumptions, often stemming from participatory and deliberative democratic theory, must be rigorously confronted with empirical evidence. This chapter therefore offered a concise introduction to evaluating citizen participation, be it a single instrument or a whole program. A comprehensive evaluation must always address context, process, outcomes, and impacts of a citizen participation instrument. However, efforts should be in relation to the scope of the instrument or program under scrutiny. What's more, evaluators and public officials are well-advised to keep expectations realistic: even the most detailed evaluation will not be able to resolve deep-rooted conflicts between opposing interests or values. In these situations, evaluation research merely provides evidence and makes conflicts transparent (Rossi et al. 2004, pp. 400–403 elaborate further on stakeholder conflicts and their consequences for evaluators). Final decisions – for example, on implementing the results of citizen participation or continuing a participation instrument – are a matter for policy-makers and the authorities.

## Introduction

In recent times, researches have shown an increase in the number of persons living with

mental health disorders. A total population of 6.6 billion has been estimated by the World Health Organization (WHO) as having at least one form of mental health disorder (World Health Organization 2013). The Out Patient Department (OPD) of Ankaful Psychiatric hospital in the Central Region recorded a total case of 1,315 patients in 2018 as against 1,236 cases recorded in 2017. The Mental Health Authority performed assessment for the period 2017 to 2018. The evaluation indicated that whereas Accra Psychiatric hospital did not record any increase in total reported OPD cases, mental health cases due to schizophrenia experienced an increase from 10,675 to 10,795 (Mental Health Authority 2019).

The increase in mental health cases in Ghana has severe ramifications for social and economic development. Persons with mental illness suffered extreme form of stigmatization, rejection by family members and were unable to engage in any productive activities (Tucker et al. 2013). With about 27,837 OPD reported cases of mental illness in the Accra psychiatric hospital alone, the implications are that there will be pressure on the few facilities available at the hospital and also the few hospital workers (Mental Health Authority 2019). Besides, there is also a significant gap between the level of mental health needs and the availability of quality services to appropriately address these needs (Faydi et al. 2011). As a result, a person living with mental illness do not receive the appropriate health care needed (Faydi et al. 2011).

In March 2012, the Mental Health Act became law. This Act aims at addressing mental health issues in the country, as it allows, for example, the protection of rights of persons with mental illnesses (Magna and Yemoh 2018). Although the Policy was in force, there were implementation challenges (ibid), like in some African countries where issues related to mental health lack total government support (Ofori-Atta et al. 2014). Consequently, there is a subtle impression that discussing mental health issues within the public domain seem unacceptable and thereby worsening existing mental health conditions of individuals due to delay in seeking health (Adu-Gyamfi 2017).

Adu-Gyamfi (2017) and others established that perceptions about mental illness have a severe impact on the mentally ill and to some extent the health workers (Adu-Gyamfi 2017; Awenva et al. 2010), which negatively affect patient attitudes toward seeking psychological help and treatment (Clark et al. 2018). This entry, therefore, reviews the mental health Policy of Ghana, the implementation challenges and education.

## Overview of Mental Health Policy in Ghana

Ghana was under British rule until 6 March 1957 when the country gained independence, but legislations of the country are still influenced by the British enactments though with some revisions and amendments (Adjorlolo et al. 2016). The history of mental health activities in Ghana started with the Lunatic Asylum Ordinance in 1888 by Sir Griffith Edwards, the then Governor of the Gold Coast (Asare 2010). During that period, the Lunatic Asylum Ordinance, Cap 79 (1888 Mental Health Law) became law and institutional care for the mentally ill introduced. At the time, persons with mental health conditions were called "lunatics," a derogatory term. They encouraged the detention of mental health patients. This law allowed the police to arrest persons suspected of suffering mental disorders (or were roaming about in towns, villages, or the bush) and confined them. Soon the facility became overcrowded, necessitating the provision of the Lunatic Asylum in 1906. With time, the prisons became overcrowded, hence the need for another institution to house them (Asare 2010; Republic of Ghana 1968).

This brought about the construction of the Accra Psychiatry Hospital in 1960, with Dr. E. F. B. Foster, a Gambian as the first Psychiatrist to work at the Accra Psychiatric Hospital (Adu-Gyamfi 2017). Dr. Foster brought many developments to the hospital and placed the hospital at par with what pertained in other countries. He initiated the training of doctors as specialists in Psychiatry which complimented the efforts of Higgison, a British national who started the

training of registered mental health nurses in 1952. The training of these professionals led to a rise in the attendance of patients to the Accra psychiatric hospital as quality services were provided (Adu-Gyamfi 2017).

In 1965, the Ankaful Psychiatric hospital was built in the Central Region to increase the number of facilities to accommodate the growing demand for mental health care. Even though there were now two hospitals, the pressure on them was still profound which led to the building of additional facility – Pantang Psychiatry hospital in 1975 (Asare 2010; Ewusi-Mensah 2001).

In 1966, there was a proposal for a review of legislation on mental health in Ghana. The government at the time constituted a committee to "investigate all aspects of the health needs of Ghana and make recommendations" (Republic of Ghana 1968:1). Despite this recommendation, the 1888 Mental Health Law (Lunatic Asylum Ordinance) remained in use until 1972 when the Acheampong military government enacted the Mental Health decree 1972 (NRCD 30) to replace the 1888 Mental Health law. The NRCD 30 focused on "institutional care to the detriment of providing mental health care in primary health care facilities, contrary to both national and international policy directives. Furthermore, procedures for involuntary admission in the 1972 law did not sufficiently protect people against unnecessary admission" (WHO 2007:3). This law did not address human rights challenges adequately but was an improvement on the previous Law (Asare 2010). Given the shortcomings of NRCD 30, a new bill was introduced in 2004 and passed as into law in 2012 (Parliament of Ghana 2012) which outlined guiding principles to regulate the mental health system of Ghana.

## The Current Mental Health Act of 2012

Before passage of the Mental Health Act of 2012, the Mental Health Decree of 1972 (NRCD 30) was in force. The NRCD 30 was considered a significant improvement over the Lunatic Asylum Act of 1888. However, some clauses in the ordinance were maintained in the Mental Health Decree of 1972 emphasizing institutional care instead of providing mental health care in primary healthcare settings (Foster 1971; Adu-Gyamfi 2017; Mental Health Improvement for Nations Development 2007). This provision in the Act was a contradiction to the many international treaties that Ghana had signed. The NRCD Decree 30 gave way for the abuse of people's freedom and liberties (ibid). This law was operational for 40 years. It significantly took away the rights of people with mental disorders by seeking to keep mentally ill patients off the street and to protect their assets. Under NRCD Decree 30, mental health patients were considered not sane enough to enjoy fundamental human rights (Adu-Gyamfi 2017). Also, persons with mental disorders suffered severe mistreatments, such as being locked away in institutions for decades (Osei 2012). The Mental Health Decree of 1972 NRCD 30 was thus never fully implemented.

Due to these inadequacies mention above, a new mental health law was promulgated. The 1972 legislation, even if fully implemented, was outdated as it fell short of best practices in mental healthcare delivery. Hence, the Parliament of Ghana passed the new Mental Health Act 846 (2012).

Following the processes initiated in 2003 to revise the Act, financial and technical support was granted by the Mental Health Department of the World Health Organization (WHO) in 2004. The steps in formulating and revising the legislation involved a series of consultations with a wide variety of international and local stakeholders with consultants from the USA, Switzerland, South Africa and Canada. The Act received presidential assent in May 2012, for the establishment of a Mental Health Board and production of a Legislative Instrument.

The Mental Health Act of 2012 focuses on improving access to health care for people with mental illness and individuals who have epilepsy. Epilepsy is a neurological disorder in Ghana instead of a mental disorder. Psychiatrists in Ghana treat it due to the shared attributes of stigma.

Furthermore, the Act seeks to protect the fundamental human rights of people with mental

disorders and to promote the recovery of the mentally ill (Osei 2012). The law also provides for the integration and regulation of the role of traditional and religious institutions in the treatment of mental illness, among others. It supports decentralization of mental health care and emphasized community care rather than institutional care; thus, it de-institutionalizes mental health care and treatment and makes treatment community-based. The Act also seeks to ensure adequate funding for the mental health sector (ibid). The Act adopts an approach based on human rights, following international agreements on the health needs of persons with mental disorders (WHO 2005). Thus, the Act ensures that healthcare standards and patients' rights are adhered to prevent physical and sexual abuse (Asare 2010).

The Provisions in the Mental Health Act 2012, Act 846, have been divided into ten sections (Mental Health Act 2012). The Act begins with a section on the Mental Health Authority which covers the creation of the Mental Health Authority, its functions and objectives. The next section on the administration of the Mental Health Authority covers the establishment of integrated Mental Health Authority to oversee the administration of the mental health sector at the regional and district level and the appointment and function of key staff. Another is on Mental Health Review Tribunal which deals with the establishment of Mental Health Review Tribunal to investigate complaints in respect of persons detained or involuntary admission.

The next section deals with the establishment of visiting committees for the mental health service in each region purposely to protect the rights of persons with mental disorder within the Ghanaian community. The Voluntary treatment section deals with the voluntary treatment for mental disorder at a facility, admission and discharge of a voluntary patient. The section on involuntary treatment deals with the involuntary admission and treatment plan of a person believed to be suffering from severe mental disorder based on the recommendation from a court for temporary treatment. The section on the right of persons with mental disorder deals with nondiscrimination, fundamental human rights, and the safeguarding the rights of persons with mental illness. The section on protection of vulnerable groups deals with the protection of vulnerable groups such as children, females, and persons with mental retardation from any form of discrimination.

The section on the Mental Health Fund provides for the establishment of the Mental Health Fund to provide funding for mental health treatment. The section also deals with the source of money for the funds and the management of the fund. Lastly, the Act ends with a section on Miscellaneous provisions covering issues like auditing the account of the Mental Health Authority, offences under the Act, and the death of patients, among others.

## Implementing the Mental Health Policy and Challenges

Mental health policies and plans are indispensable tools for providing mental health services, without which mental illnesses are likely to be treated in an inefficient and fragmented manner (Ssebunnya et al. 2012). When there is a clear commitment of government toward a well-conceptualized policy, there is a greater chance to achieve the desired impact consistent with international standards (Ssebunnya et al. 2012). However, in Ghana mental health policy implementation lacks the needed impetus from governments since colonial days hence the struggle to implement mental health policies.

Jenkins et al. (2011) discussed the economic, human rights, and political challenges to global mental health and the implication for policy implementation. They argued that there is an inextricable relationship between mental health, poverty, and debt. Mental disorders inflict significant economic pressure not just on the individuals with the disorders but also on their households, communities, employers, healthcare systems, and government budgets. They contended that mental disorders are responsible for the cycle of poverty in many low-income societies as it interferes with the individual's ability to function in either paid or non-pay roles, thereby making them less productive socially and economically. They concluded that the mental health sector needs to form partnerships, supported by collaborative training,

research, and mutual dialogue, with other institutions to ensure the use of comprehensive budgets and initiatives for mental health.

The Mental Health Bill, after 8 years of delay, was finally passed into law, still struggles to see implementation. Walker and Osei (2017) had identified some challenges stakeholders believe are barriers to the implementation of Ghana's Mental Health Act 846. These include limited dissemination of the Act, delays in the parliamentary process for the passing of the Legislative Instrument, poor access to patients in non-orthodox mental health facilities, inadequate financial resources for implementation, inadequate human resources, and inadequate infrastructure for mental healthcare provision. Besides, it is also evident that lack of awareness of the burden of mental illness and the lack of a reliable information system are among the factors that impede the successful implementation of mental health policies in the country. Others have also suggested that mental health issues are often given a low priority by policy-makers and institutions coupled with inadequate funding by the central government (Awenva et al. 2010). Also, the need for strengthening of mental health information systems, and the financial implications of the Act were among the challenges identified.

Despite the successes chalked in passing Ghana's mental health Act 846 of 2012, there are still difficulties in implementing the Act. Government, acting through Parliament should address the issues of the legislative instruments and the financial implications to all smooth implementations. Jenkins et al. (2011) suggested the mental health sector needs to form partnerships, supported by collaborative training, research, and mutual dialogue, with other health and non-health sectors to enhance the use of more comprehensive budgets and initiatives for mental health for a more efficient implementation.

## Mental Health Literacy and Education

Mental health literacy defined as knowledge and beliefs about mental disorders which aid their recognition, management, or prevention (Jorm 2012) is a prerequisite for recognizing and intervening early in mental disorders (Dias et al. 2018). Aside from the recognition, management, and prevention of mental illness, researchers noted some factors predict mental illness and stigma. These include: what people know and believe about the causes and treatment of mental illnesses, gender, and age (Usyatynsky 2016; Yamawaki et al. 2016; Feeg et al. 2014; & Lim 2016). In Ghana, the perception of mental illness at the community level is that it is a curse and a punishment from the gods, resulting into the belief that those with a mental illness are deserving of their punishment (Adombiri-Naba 2013; Tawiah et al. 2015; Kpobi and Swartz 2018). Any effort to address societal stigma and self-stigma of mental illness ought to start with mental health literacy.

In discussing interventions to reduce mental health stigma, Norms et al. (2016) cited major campaigns world over including national anti-stigma interventions from Australia, Canada, and England that have included education, advocacy, mental health literacy campaigns, and legislative and policy change, among others. The implication is that Ghana cannot live out mental health literacy as a pivot in the fight to advance the course of mental health care.

## Strategies to Reduce Mental Health Stigma in Ghana

Stigma and discrimination are as severe and disabling as the mental illness itself. This is manifested in the fact that as soon as a person develops a mental illness societal attitudes change towards the person immediately. Overnight, the person loses most of their human rights, including the right to decision making, the right to employment, and the property right. The stigma is not confined to the patient alone; it is extended to members of the family. Specifically, it is difficult for a person who has ever had a psychiatric problem, or members of that family to get married. The stigma and discrimination persist even when a person recovers from mental illness. This is also due to the myth that nobody can recover from mental illness and that once you have a bite of it, you would relapse from time to time. Another

myth that powers the stigma is the high level of violence attributed to people with mental health problems, even though research findings have stressed that the violence is exaggerated (Pescosolido et al. 2019; Silver et al. 2008; Clement et al. 2011; Mulvey 1994; Stuart 2003; Stuart and Arboleda-Flórez 2001).

The stigma of mental illness is such a problem that can lead sufferers to experience isolation and shame, harassment, bullying, and, on occasion, violence even at the workplace. Meanwhile, researchers such as Stuart (2004) have argued that work is the single most important activity a person engages in that expresses a sense of self, influences how and where one lives, promotes social contact and social support, and confers title and social identity on the individual. In Ghana, there is little research on workplace mental health. There is a need for workplace mental health research to drive policies and interventions aimed at reducing mental health stigma.

Further, as Younkins (2002:72) noted, "Work is at the root of a meaningful life, the path to individual independence, and a necessity for human survival and flourishing. It is also the distinctive means by which men concretize their identity as rational, goal-directed beings." Access to satisfying work remains one of the most sought-after goals of the adult population within most countries (Harnois and Gabriel 2000). For this reason, exclusion from work can cause a person to feel isolated, alienated, and despairing to the same extent as being deprived of the material benefits of work (Stuart 2004). Further, becoming unemployed, difficulties finding a new job, and difficulties returning to work after absenteeism, due to mental health problems, are all outcomes of mental health stigma (Baumann et al. 2010). To adequately resolve issues of mental health stigma require governments not only in Ghana to enact policies and laws that ensure re-integration into the workforce as well as access to new jobs and skills for past sufferers of mental ill-health.

Globally, several anti-stigma interventions have been introduced both in the workplace and in the broader community. Researchers have been reviewing the effectiveness of these interventions to enhance further interventions. Norms et al. (2016) discuss interventions to reduce mental health stigma citing major campaigns world over including national anti-stigma interventions from Australia, Canada, and England that have been evaluated concerning their targets, goals, and outcomes. The interventions included education, protest and advocacy, contact, peer services, mental health literacy campaigns, and legislative and policy change among others. The authors conclude that stigma reduction requires a multidisciplinary and a multilevel ecological approach to understanding and addressing structural stigma and engaging groups and organizations like lawyers, journalists, educators, and business and property owners. For this reason, anti-stigma efforts should not focus narrowly on "soft goals" of public education and attitude change but should expand their focus to address "hard goals," such as legislative and policy change that can promote social equity and improve the overall quality of life for people with mental health problems and substance use.

The work of Hanisch et al. (2016), which focused on a systematic review of sixteen anti-stigma intervention studies within the workplace, found that the effects of interventions on employees' attitudes were mixed but generally positive, and can lead to improved employee knowledge and supportive behavior toward people with mental health problems. There is reason to believe that if anti-stigma interventions (education, advocacy, policy and legislation, etc.) are rightly focused and executed targeting both the soft and hard goals, the outcomes can be positive for both the individual and society.

Mental health stigma needs to be understood and reduced by any nation interested in both the welfare of her people and the productivity of the workforce as well as the economic growth of the nation itself. Both social and self-stigma pose a significant challenge to societal well-being and therefore requires attention.

## Conclusion

This study reveals that mental health legislation in Ghana predates independence (Adjorlolo et al. 2016; Asare 2010; Republic of Ghana 1968). It

points out that the history of mental health activities in Ghana started with the enactment of the Lunatic Asylum Ordinance in 1888 by the then Governor of the Gold Coast (now, Ghana) which has witnessed significant amendment over the years. The inadequacies in the previous legislation led to the promulgation of the current Mental Health Act (Act 846). However, there are barriers to the effective implementation of mental health policy. These barriers include lack of awareness of the burden of mental illness, the lack of a reliable information system, low priority of mental health issues by policy-makers and institutions coupled with inadequate funding by the central Government. These challenges have impeded the successful implementation of the policy in the country. It is important that government provides the necessary financial and other vital resources for the implementation of the mental health policy. Also, all stakeholders should be involved in all stages of the implementation process and to provide training for mental health workers. It is only when the Policy is fully implemented and functional that mental health literacy campaigns would be useful in the fight to advance the mental health care throughout the country.

# Evidence-Based Policy-Making: Merits and Challenges

Fatih Demir
Public Administration, Manisa Celal Bayar University, Manisa, Turkey

## Synonyms

Decision-making; Evidence; Evidence-based policy making; Policy; Public policy

## Introduction

The democratically elected may be interested in increasing the effectiveness of their policies through designs, implementations, and evaluations of much more consistent policies and programs. In a democracy, if governments do not give good results, they lose sympathy and possibly votes; therefore, its inefficiency has a high cost, and therefore, the way to improve performance based on the use of knowledge or evidence is sought. This paper seeks to display the debates which have evolved around the concept of

evidence-based policy-making and to weigh its advantages and disadvantages by making reference to the newly emerging literature on the topic.

Ensuring that scientific knowledge is used in the making of public policies is a long aspiration in different parts of the world (Hanna et al. 2010; Reimers et al. 2000). From this logic of modernity, evidence-based research attributed a power of change and transformation of public affairs. This aspiration – however important it may be – is generally not met. There are multiple reasons why there is not only a gap between ideas and action, but it also widens. It is not the subject of this paper to explain those that originate the misunderstanding between researchers, decision-makers, and practitioners; the objective, rather, is to discuss a relatively new policy approach that is taking a growing momentum in different countries to try to convert scientific evidence into usable knowledge known as evidence-based policy and practice.

The second part of the article describes the steps to develop the systematic reviews, the central methodology of the evidence-based policy and practice, and begins to delineate some merits and limitations of such exercises. The third and last part delves into the critical analysis and provides three elements for the discussion: what type of evidence the EBPP uses, how is this approach complemented with other epistemological positions commonly used in the field, and whether it is feasible to use the evidence of "high quality" in the field.

This work concludes with inviting the debate based on the identification of some advantages of the EBPP such as the clear definition of objectives and the open and collective process on which the "evidence" is generated. However, like all academic proposals, it also has limitations, and one of them is to suggest that the "evidence" is only the measurable effects originated by some intervention or educational program or that by having evidence of "high quality," it will be used automatically. Studies on the use and impact of educational research allow us to visualize barriers to the adoption of approaches such as evidence-based policy. This could be a lesson for both the scientific and the political fields.

## The Development of Evidence-Based Policy

In the seventeenth century, the British philosopher Francis Bacon imagined New Atlantis, a place where politics was based on knowledge, truth, logic, and evidence. He suggested that sciences devoted to different specialties should collaborate to improve the living conditions of people. Virtuous people were those who were looking for truth, and virtuous politicians were those who based their decisions on facts. In his well-known words, "knowledge itself was power." (In Latin "*ipsa scientia potestas est*." See Bacon 2009.)

The evidence-based policy is a practice that seeks to ensure that decisions and public policies are addressed based on technical-scientific evidence incorporating empirical knowledge in development and implementation processes. The premise of the evidence-based policy-making indicates that from the available evidence and systematic rational analysis, better results are produced than those public policies that are only driven by ideology. The ultimate goal must be the construction of a modern and professionalized state where evidence meets with rigor and objectivity in order to make decisions that lead to the progress of society.

In this paper evidence-based policy-making has been examined in relation to whether the evidence produced by academic studies in the literature is used in policy-making by elected officials, consultants, and public officials. Demands for the use of evidence in policy-making are based on the opinion that people carefully evaluate the evidence about competing options and make better, more efficient and successful decisions if they choose the policy which is most likely to maximize their interests (Coburn et al. 2009: 1116). This is a view largely borrowed from the business world. The main factors underlying the fact that evidence has become increasingly important in policy-making and implementation include increasing the level of education of the people, increasing the level of education and communication technologies, increasing the number and capacity of research units, increasing productivity, increasing the emphasis on international

competition, and increasing importance given to government control and accountability (Smith et al. 2000).

In the context of trial and error, policy-makers develop hypotheses about the best way to achieve a goal first. They then test their hypotheses by applying their policies and analyzing their impact. As a result of the analysis, they come up with an idea about how well their policies work and decide whether to continue, improve, amend, or terminate their policies (Kay 2006: 51).

Evidence-based policy-making has two main objectives: (i) using the information provided by program evaluation for policy-making and (ii) generating more information to ensure that future decisions are more informed. Evidence-based policy-making can take many forms to achieve these goals. These may include the use of research findings to provide information to new policies or to improve the effectiveness of existing programs, to support data collection and analysis for research and management, and to develop policies that encourage the use of evidence.

There are four principles of evidence-based policy-making that policy-makers, agency managers, and other public leaders can use to improve the results achieved in the public sector. These principles represent the reconciliation of researchers and practitioners who aim to improve the production of policy decisions and the management of programs and set targets for democratic processes, policies, and programs. Evidence-based policy-making is an important tool to achieve these goals.

The first principle is to create and compile rigorous evidence of what works, including costs and benefits. The second principle is to follow the execution of the program and apply the impact assessment to measure the effectiveness of the program. The third principle is to improve programs, evaluate actions that work, and use rigorous evidence to shift funds from programs that are inefficient to other programs. Finally, the fourth principle is to promote innovation and test new approaches. (These principles are summarized from the website http://www.evidencecollaborative.org/principles-evidence-based-policymaking.)

Shaxson (2005) underlines the importance of five elements for the soundness of evidence: credibility, reliability, generalizability, impartiality, and originality. The finding of evidence is a necessary but inadequate condition for decision-making processes. At this point, it is important that, among other things, the relations between the policy-makers and their consultants work well. Because policy-makers have different backgrounds, developing a common language helps to put the debate on the soundness of evidence on a firm ground.

## Evidence and Policy Advocacy

According to Bellinger, policy analysis serves at least two purposes, given its relationship with evidence. First, the evidence provided by policy analysts is used as arguments to support certain policy positions. The findings of scientific studies and research can always be used as evidence by political parties or interest groups. Such groups finance research that is likely to support their point of view. Second, independent policy research can help resolve conflicts among interest groups. The decision-makers may find the evidence presented by the parties convincing and can establish policies based on these evidence. Many policy debates between the parties advocating specific policies involve disagreements on the results of values, problem definitions, evidence, and policies. Defenders of a particular interest group or ideology offer a set of value arguments, definitions, evidence, and policy recommendations designed to support their point of view. The use of policy analysis as a convincing argument depends on the concordance of the findings of policy studies with the goals of policy advocates. Therefore, selective use of policy analysis and other evidence in policy discussions is quite natural (Bellinger 2015: 8–9).

Policy advocacy, which is one of the most important debates on the advice function, involves a wide range of activities that are largely related to nongovernmental groups and affect decision-makers. Among these activities are litigation, lobbying, and public education. In

addition, capacity building, relationship building, networking, and leadership development can be listed. All of these activities are largely undertaken by nongovernmental groups, because such organizations traditionally serve the masses that are limited in their ability to make their voices heard in policy processes.

The government's 1999 report published in Britain said that government expected more from policy-makers. The report advocated more ideas, more willingness to question the ways in which they are built, better use of evidence and research in policy-making, and better focus on policies that will achieve long-term goals (Cabinet Office 1999). The white paper published by the European Commission in 2001 states that scientists and other experts play an increasingly important role in the preparation and monitoring of decisions. Accordingly, in all matters ranging from human and animal health to social legislation, all institutions rely on expertise to estimate and identify the problems and uncertainties that the EU faces, to make decisions, and to ensure that the risks are publicly and simply disclosed (2001: 19).

## Interpretation of Evidence

A number of studies have been conducted to determine that interpretation of evidence plays a critical role in decision-making processes. David (1981) and Kennedy (1982) suggested that decision-makers paid more attention to evidence which are parallel to previous information, and especially used research that supported their own views, and did not even mention research findings contrary to their own views. Coburn (2001) found that the way information is processed affects how the evidence is interpreted. People with different beliefs may interpret the same evidence in opposing ways. There are also studies showing that decision-makers have a strong tendency not to take into account evidence that do not support previous beliefs or actions. (Among these are Birkeland et al. 2005; Coburn and Talbert 2006; and David 1981.) In addition to ignoring or neglecting information, it can be seen that decision-makers or their political supporters may even try to discredit the research findings that present contradictory findings.

Coburn et al. (2009) focus on the interpretation of evidence when addressing the use of evidence in policy-making. The authors carried out interviews with staff working in various levels of a school district in the United States for 3 years while conducting their work, observed planning meetings and professional development processes, and collected a large number of internal and external documents. In this process, they identified 45 decisions taken by the regional administration and conducted in-depth analysis on 23 of them. The result was summarized as follows:

> In complex organizations such as school districts, decision-making processes are often related to interpretation, discussion and persuasion. Evidence and other types of information do not provide answers; rather, it provides raw materials for meaning extraction and interpretation. These processes are largely based on pre-formed beliefs and practices; they guide the person's understanding of problems and solutions. (Coburn et al. 2009: 1117)

According to the authors, it is critical to understand how public officials employ information and data they obtain and the factors they consider when using this body of knowledge. One of the tools used for this purpose is called sensemaking theory. (For more information on sensemaking theory, see Dervin 1998; Savolainen 1993; and De Jaegher and Di Paolo 2007.) This theory involves the making sense of information and the production of what is being interpreted and tries to explain the processes of giving meaning to people's experiences. It is also useful for the analysis of the use of evidence because it enlightens the processes that underlie the use of evidence for real-life reflections and provides insights into the organizational factors that shape these processes (Coburn et al. 2009: 1117).

Another concept which is closely related to the evidence-based policy and practice approach is the methodology known as "systematic review." Like any methodology of pragmatic cut, it opens diverse controversies. The central argument is that the evidence-based policy tends to build knowledge in an open and plural way and encourage

policy change; however, the adoption of these methodologies in most countries seems complicated by virtue of the barriers detected by previous studies on the use of knowledge in evidence-based policy processes.

The instrumental approach to the evaluation of information providing input to decision-making actions argues that the evidence is "neutral" and that its meaning is closed to interpretation. However, many studies now show that the evidence is subject to interpretation. (For details, see Hopf 2007; Evett et al, 2000; and Pham 2007.) Among the interpretations of the meaning and meaning of the information obtained, many may contradict each other (Johnson 1999). On the other hand, the evidence does not always point directly to a suitable solution. There may not always be a complete overlap between a given finding and appropriate action. At this point, it is possible to see that interpreting processes play a critical role in converting information into a solution proposal.

As a result, evidence alone does not answer public policy questions. The act of interpretation is, in its nature, part of a policy process shaped by interests connected to social and political processes operating in specific organizational contexts (Sanderson 2003: 342). In Johnson's (1999) argument, evidence provides the raw material needed to produce and interpret meaning. Interpretation and negotiation are of great importance at the point of making sense from the evidence. In addition, politics plays a critical role in defining a problem and using evidence in decision-making on policy solutions. It is not surprising, then, that different political parties achieve very different conclusions based on the same findings. (See Head 2008; Howlett 2009; and Howlett and Newman 2010.)

## Problems of Evidence-Based Policy-Making

Williams argues that evidence-based policy-making has four main problems. The first of these problems arises from the competition between the concepts of "managing with evidence" and "measuring by policies." While policy workers are encouraged to use evidence in policy decisions, on the other hand, they are asked to measure them by policies. (The concept of managing by measuring is defined as the search for objective indicators as the basis of initiating and evaluating political actions. See Noordegraaf and Amba 2003.) Both are results-oriented, but often conflicting, expectations. In his attempt to describe this dilemma, Williams argues that policy workers often have to decide which of the following is more important: activities that encourage the systematic integration of research into policy decisions and require investment in a large source of human and financial resources or the activities that make it appear as a person trying to manage in a responsible way (Williams 2010: 196).

The second problem is that policy narratives are part of the policy process: a narrative can be used as a justification beyond being merely descriptive. Conventional policy statements acknowledge that government unilaterally determines the objectives. In such explanations, research is only required to determine the appropriate targets and to identify the extent to which these goals are attained. In this context, research can help policy-makers achieve better results by providing objective answers to these questions (Williams 2010: 197). (However, some interpretative authors (e.g., Fischer 2003; Stone 2001; Yanow 2000) argue that policy-making is not simply a process that involves selection of tools based on academic research. Policy-making takes place in an interactive, discursive, and negotiating field. Academic research is just one of the valid meaning frameworks. Therefore, policy workers may have uncertainty about where the research is useful (Williams 2006: 197).)

The third problem is how to compare the effect with other norms. Policy workers are asked to further integrate research into policy, but academics are under greater pressure to add influence to their research (Williams 2010: 198).

The fourth problem is that if other forms of knowledge generation are considered valid, how can information based on academic research be influenced? The demand for policy-based

evidence and the impact of academic research on policy is based on the following assumption: academic research will produce higher-level, objective information, which will help achieve better policy outcomes. However, in the postmodern period, this view faces objection from academicians themselves. Postmodern scholars argue that not only the information they produce but also other types of knowledge (e.g., experiences) are as valid and respectable. Postmodern researchers have shown that the claims of knowledge supremacy and experience privilege of the social sciences are no longer valid (One of the most important advocates of this view, Huberman (1990, 1994), examined the impact of postmodern approach on educational research. The author argued that combining the findings of researchers with the experience of practitioners would increase the validity of the data they obtained.) (Williams 2010: 199).

## Components of Evidence-Based Policy

In addition to the problems mentioned above, there are four basic components of a public policy with reference to evidence-based policy-making. First, the objectives of all public policy are to create evidence-based solutions through, for example, an impact analysis that allows us to evaluate if there is a significant relationship between the results of the intervention that was carried out and the objectives set out at the beginning of the policy implementation. For that it is necessary to prove its effectiveness through the constant monitoring of the proposals contrasting them with information.

Another important component to build a public policy is the analysis of the costs involved in carrying it out, because it is essential to choose the projects that represent less spending and give greater results to optimize our management.

A third important element in public policy is establishing a causal chain (Stone 1989; Lodge and Shrader-Frechette 2003), that is, to recognize the method used to generate impact on the population. In this way one can avoid falling into a "black box," that is, not understanding what effects are actually causing, since it is necessary to be clear of the changes that our actions cause to know where to go deeper.

A fourth element to create public policies based on evidence is to study the different effects that our proposals have on the diversity of the population (Riccucci 2018; Hero and Tolbert 1996). There are minorities and vulnerable groups that could not be positively impacted (heterogeneous effects). Therefore, we must increase disaggregations (separate elements that were linked together) in order to identify these minorities and include them in the effects of our interventions.

Without evaluation, positive results cannot be obtained from public policies. The planning role of the state is fundamental. Without information we cannot know where we are going and what we are going to propose. For example, only depending on an impact and utility study, is it possible to distribute the general state budget? Planning provides us with evidence to execute the best plans. And to carry it out, it is essential to collect and organize a lot of information such as administrative records, information on geographical organization, and statistical data. All this allows for feedback and correction of the budget.

## Possibilities and Limitations of the Evidence-Based Approach

The discussion on the new currents for the use of knowledge is necessary by virtue of three fundamental aspects. The first refers to the need to improve the performance of governments in the conduct of public affairs. In 1999 the British government proposed introducing an "enlightened" vision to develop public policies. The then prime minister, Tony Blair, suggested that the formulation of good policies depended on having high-quality information, which is obtained from various sources such as specialized knowledge, existing national and international research, statistical data, consultation with interested stakeholders, previous policy evaluation exercises, recent research, and even secondary sources (Cabinet Office 1999).

Does a case study analyzed by an investigator constitute "evidence" to nurture educational policy and school practice? Philip Davies affirms that the systematic reviews are based on the observation of Cook et al. (1983), who point out that the singular studies are limited to make generalizations about the knowledge they produce in relation to concepts, populations, contexts, and time and, frequently, they only illuminate a part of a great puzzle that seeks to offer explanations (Davies and Nutley 2000: 366). Systematic reviews highlight the construction of a "collective wisdom" – in the words of Pawson (2002) – because this could ensure an unbiased interpretation of results. This plurality and collective construction of evidence seems to be an advantage of EBPP.

Within the evidence-based policy and practice approach, there is a type of evidence that is taken as such, and this is the effect produced by a program or intervention on a group of users exposed to such intervention. To measure this effect, articles or studies (published or not) must be selected based on a quasi-experimental exercise and randomized control tests (RCT) to determine if there are statistically significant differences between a control and an experimental group.

To say that "evidence" is one that is achieved by means of a single technique of gathering information can suggest a superiority of quantitative approaches over qualitative ones. This division between one perspective and another can make us fall into sterile discussions, so it would be worth clarifying three things. The first is that each information collection technique tends to answer questions of a diverse nature. While the quantitative technique, within the EBPP approach, seeks to estimate the effect that produces an intervention, the qualitative tool responds to other equally valid purposes such as understanding how an institutional phenomenon occurs within a specific context. Second, there are methodologies that are being developed to make systematic reviews with unstructured data and generate "evidence," although it is clear that qualitative research synthesis is less common than controlled experiments, according to Davies and Nutley (2000).

Finally, the third clarification is that the criticisms of EBPP have suggested the possibility of broadening the information base to build "evidence" and not only keep the hard data about the effectiveness of policy programs or interventions. Ávalos Bracho, in his paper on evidence-based policies, states that:

> [. . .] the evidence is not identified with the existing information, but is a fact that is constructed both from the information systems of the public administration and from the researchers themselves in their evaluative activity and that acquires an argumentative meaning in their political use [. . .] the evidence is such at the precise moment it is available, disseminated and used to provide feedback to public policies. (Ávalos Bracho 2010: 331)

Bracho's point of view is reinforced by Head (2008), who affirms that there are at least three types of "knowledge" and, therefore, of "evidence": political knowledge, rigorous and scientific technical analysis, and practical experience of the professional field.

The political knowledge, according to Head, is built priorly by politicians, parties, organized groups, and the media and is related to the analysis and judgment of all those political actors. It is revealed through the determination of priorities, the formation of the agenda, and the adjustment of strategies and tactics, communication, and ideology. The policy, seen through the lens of political knowledge, refers more to the exercise of persuasion and support than to an "objective veracity" (Head 2008: 5). This position of Head is congruent with Majone's thesis of argumentation and persuasion who has argued that "[t]he argument is the link that links data and information with the conclusions of the analysis" (1989: 103). Policies do not arise linearly, suddenly, or much less spontaneously from the data, be it structured type (quantitative) or qualitative.

The second form of evidence, following with Head, is scientific knowledge, which is constructed through systematic analysis. Although Head (2008) does not grant that it is the product of systematic reviews, it does highlight a characteristic of these, which is the need to ensure the quality and consistency of the data as part of this knowledge.

The third form of evidence mentioned by Head is that which is constructed through the implementation process or what he also calls practical wisdom (2008: 6). According to Head the administrative teams of the programs are generally disconnected when these are the ones that "struggle" with the daily problems of the implementation of the same. Head continues and mentions that this type of knowledge generated at the base of the service delivery system can be seen as "good practices" (2008: 7).

## New Public Management and Evidence-Based Policies

In the specific area of intersection between evaluation and public management, it is probably the evidence-based policies that are the most advanced point today. Indeed, since the 1990s, a powerful social movement has become infatuated with the evidence-based policy, in English-speaking countries and beyond, which combines benchmarking and econometrics (Desrosières 2008: 32). It developed particularly in Great Britain with the coming to power of New Labor. The somewhat "realistic" achievements of sociological reflection and of previous political science on public policies seemed to be questioned. This international movement is too big for us to analyze its details and its multiple determinants: it concerns the evaluation of both South American policies of "conditional cash transfers" and the experiences launched in the United States by philanthropic foundations (Mayor Bloomberg's action in New York); the promotion of "social experimentation" by the European Commission within its Europe 2020 program; the rediffusion of random sampling methods in Europe; and the launch of social assistance programs such as the RSA in France, the Hartz reform in Germany, etc. One of the most astonishing paradigmatic revolutions in this field is represented by the Communication from the European Commission [(2013) 83 final of 30 February 2003] entitled "Towards Social Investment for Growth and Cohesion." This programmatic text of social protection reform advocates the reconfiguration of the latter in "targeted, conditional and simple" programs but also "of temporary duration." These programs would thus be more easily assessable by impact assessment methods. It will be necessary to see in the future how communication of strategic importance for social policies in Europe contributes to the modification of this sector in depth or not.

In any case, it is clear that in the EBP, we are now very far from the analysis of public policies as it was promoted in the 1980s and 1990s. However, as in the case of limits of the "logic of the engineer," the potentialities of the conception of policies based on real "proofs" are to be relativized in the light of the past. This is what Weiss has done recently by resuming a modest and realistic vision of the plurality of methods, having long since campaigned for cognitive contribution (Weiss 1993), but not immediately usable, that evaluation operations are able to offer to society. Reflecting on the fashion adopted by the US Department of Education in 2003 to rely solely on programs that have been evaluated by experimental methods, she and her colleagues could recall, with a few exceptions: "many investigations in many countries have shown that assessment has had usually only modest impact in policy and practice" (Weiss et al. 2008: 30). Evidence-based policy assumes that the ends are given, and the issue is to choose the best way to get there. But there are circumstances in which moral and ethical considerations must" come into play" (Weiss et al. 2008: 44).

## Does the Quality of Knowledge Ensure Its Use?

Systematic reviews involve a fine process of analysis, time, and a large amount of intellectual and material resources. If the systematic review is a formal and rigorous process, does its use depend on these characteristics? Thanks to the accumulated knowledge about the use of policy research in the world, this question can be answered.

In terms of knowledge base of policies, Riege and Lindsay (2006) assure that the problem of the quality of the research was a recurrent concern of

researchers and that it was also one of the resources to explain the scarce impact of research in some areas such as postgraduate study or environmental protection. The works in these areas, according to Ward et al., were not "sustained by extensive research" and "suffered from a low level of generalization of results [. . .], analytical poverty and in other cases, they lacked" consistency between the proposed theories, approaches, and methods used (2009: 275).

More recently, some authors such as Giraldo et al. (2009) have assured that the quality of the research is not necessarily related to its use. According to this author, there is a tension between the autonomy of the researchers, their degree of public interference, and the quality of the research they carry out. That is to say, the more autonomous is the investigation with respect to the "political perks," there may be little chance of having an impact, but at the same time, the research could be of higher quality. Moreles concludes that in several countries, the quality of research is not directly associated with its use. This is a warning to adopt the EBPP. If the evidence selected in the systematic reviews is of "high quality," why is it not used to the degree that is expected? Researchers such as Golden-Biddle et al. (2003), Hofmeyer et al. (2012), and Kothari (2011) have shown that personal contact between the researcher and the authorities is central for the policy to incorporate, in a partial, discontinuous, and sometimes problematic way, knowledge of the expert. Brown (2009), meanwhile, has also observed that the impact of knowledge on politics is a complex phenomenon and that, therefore, cannot be treated under purely technical assumptions. This author suggests that there are four dynamics that have to be considered to analyze whether ideas impact on public action that are of "social nature" (what changes are required by the policy) or of "scientific nature" (epistemological correction, validity of knowledge).

In addition, the term "relation" between research and policies should be taken with caution, since it can be artificial when it comes to testing by means of certain empirical evidence. For some scholars such as Hammersley (2002), Lavis et al. (2002), and Bogenschneider and Corbett (2011), this relationship manifests itself in different ways and suggests that it can be "subtle, indirect and interactive" and be conditioned by various factors such as the "alternation and expansion of roles" of the actors involved, the characteristics of research, and relationships informal and personal contacts that are established between the actors. In summary, concentrating high-quality scientific evidence in systematic reviews ensures its use in policy processes and practice.

Walter et al. (2005) point out that the use of research is a continuous process that ranges from alerting and becoming more aware of a problem to changing attitudes and changing policy decisions. That is, there can be both a conceptual use of the evidence and a clearly instrumental one. These authors also identify five mechanisms by which the evidence is used, namely:

- Dissemination, which consists of the circulation or basic presentation of the findings in unprocessed formats to potential users
- Interaction, which seeks to develop closer links and collaborations between research, policy, and practice
- Social influence, which is based on trying to influence other experts through persuasion
- Facilitation, which occurs when developing organizational, technical, financial, and even emotional support
- Reinforcement, which includes the use of rewards other than evidence for the purpose of inducing certain behaviors of knowledge users (Walter et al. 2005: 341)

Walter et al. (2005) also reveal at least three lessons when they try to answer the question: "What works best to promote evidence-based practices" in the areas of health, justice, social protection, and education? Through the review of 93 articles with empirical applications, they ensure that (i) informal contact has value in promoting the use of research; (ii) cultural resistances are evident at the suggestion of changing a practice even when it is based on evidence and is justified by itself; and (iii) there is no optimal mechanism to ensure the effective use of evidence: however, they clarify that in some policy

sectors (i.e., education), it seems that interactive approaches are better received than in others (i.e., health) where reinforcement is more likely to succeed.

It would seem then that the use and impact of research and specialized knowledge are deeply mediated by a series of human and personal relationships, and, therefore, it is not enough to appeal to the quality of the evidence to await its use.

## Weighing the Merits and Limitations

Should we adopt or reject the evidence-based policy approach in the field of public policy? If we take into account the consolidation of the field of policy research, the need to raise the effectiveness of governments in the conduct of public affairs such as education and health and the dismantling of efforts in the areas of evaluation of policies and programs, the answer would point to the positive side. The approach should be adopted. This argument is reinforced by some characteristics of the systematic reviews, which are the central core of the EBPP. One of these characteristics is that the evidence is generated through a collective process, open and with explicit criteria for the selection of material and, therefore, subject to constant refutation. (See Colman et al. (2008), Morrell (2012), and Selamat and Hashim (2008).) Also, the systematic reviews are clear in their objective. With these exercises one wants to know what programs or policy interventions really work for the benefit of the users. The evaluation dimension is clearly defined when initiating the preparation of an exercise of this type.

Another observable merit of the EBPP is its emphasis on encouraging policy change. This advantage is shared with other types of epistemologies and approaches such as the empowerment evaluation (Fetterman et al. 1996). However, the EBPP, like all academic proposals, also has limitations, and one of them is to suggest that the "evidence" is only the measurable effects caused by an intervention or policy program. Authors like Aguilar and Santos (2011), Majone (1989), Head (2008, 2010), and Ávalos Bracho (2010) argue that scientific evidence must be complemented with other information such as that originated in the processes of operation and in the spheres of politics. Likewise, it is important to consider scientific evidence as an incentive to debate which can be the most appropriate policy instrument to face the problem detected. The evidence, in this sense, "acquires an argumentative meaning in its political use" (Bracho 2010: 331).

There is another limitation to approaches such as the EBPP or methodologies such as systematic reviews to be addressed. Although it is said that high-quality evidence is produced with this type of exercise, its use in most polities does not depend on the quality of knowledge but on schemes of personal and human interaction that are much more complex. Even so, if the primary objective is to make the policies and programs work for what they were designed and that the policy change is well founded, we will have to continue reflecting on the role of ideas in our daily world, which is "the greatest challenge for 21st century science is that of the cosmos or the world of sub-nuclear particles" (Rees et al. 2003).

In this paper a less opinionated and better informed political debate which allows for analytical approaches has been advocated. But why not generalize this request and demand this analytical approach for the very exercise of politics? This is what the evidence-based policy aims to do: to introduce a concept that is not new but that took momentum under the government of Tony Blair in the United Kingdom, when he advocated a "modernization of the state" that would limit the weight of ideology and produce policies that "took shape based on evidence and not as responses to short-term pressures."

The idea looks simple: evidence-based policy seeks to ensure that public policies are (more) informed by evidence based on rigorous research. In practice, this involves incorporating empirical knowledge in all stages of the process, from when the problem is identified until a policy is formulated and implemented that confronts it. It also involves checking the success or failure of actions in operation and even carrying out tests to evaluate a program before its implementation. In bold outline, what is pursued is to assimilate the

scientific procedure of, say, medicine and other disciplines.

The best illustration of the concept is the pilot tests of public policies called "randomized controlled trials" (Begg et al. 1996; Concato et al. 2000; Benson and Hartz 2000). A paradigmatic example is the programs in India to improve school results, which are tested in a hundred or two hundred schools at random and which, when successful, spread throughout the country (Best and Kahn 2016). Similar studies are frequent in development policies, but there are also mundane examples, such as the British Cabinet Office, which proved with an essay that sending an SMS to the defaulters multiplied the percentage of payers by six. Other times the results serve to abandon failed policies. A few years ago, the United States and the United Kingdom launched a program that consisted of interviewing young people with prisoners so that they were aware of the risks of a criminal life; however, the program achieved the opposite: the participants in the program committed more crimes (Cohen 1998).

However, these ideas are not revolutionary. Public policies are already nourished by empirical evidence, but this practice should be routine and more intensive. Simply, if a policy pursues an objective, it must be well founded, and it is convenient to check that it actually achieves what it proposes.

At this point, a warning is necessary: empirical knowledge cannot supplant the democratic process by which divergent criteria and interests are reconciled. First of all, because the technical aspects – the effectiveness and efficiency of an action – are not the only relevant factors in the genesis of public policies, the process is complex, nonlinear, and multifactorial. There is always room for the interests of a relevant party regardless of its technical merits. Above all, it should be remembered that the ability to self-govern is good in itself and that the preferences of citizens have an intrinsic value. This means that good politics necessarily has a core of social dialogue and discussion of interests.

In short, empirical evidence and technical criteria should not impose the future of politics, but they should contribute to this process as an important element. It is an element, in addition, of increasing importance, because our societies face increasingly complex challenges that demand ever more subtle solutions. The mere intuition is a counselor who loses faculties every day and must leave room for other more rigorous ways of knowing what to do and how to do it.

## Conclusion

In the first two decades of the twenty-first century, most countries of the world have to face the challenge of improving economic growth and productivity, which requires introducing reforms in most political institutions. The renewal of the state poses technical and political difficulties, but the greatest difficulty is to solve both simultaneously, since the technical and democratic procedures run in separate channels and have different objectives. The economic analysis seeks optimal solutions that will hardly be socially feasible. Democratic procedures seek compromise solutions, which will hardly be economically optimal. As a global tendency, it presents the same problem of balancing economic growth with people's well-being. In terms of evidence-based policy-making, it is a high priority for citizens to stay out of the so-called struggle of ideas and interests and adopt a reconciling and constructive attitude that allows synthesizing and expanding the best of evidence and democratic values. To address these uncertainties, evidence-based policy is proposed. Instead of looking for optimal policies, the evidence-based policy analysis framework proposes a systematic search for robust public policies. On one hand, the evidence-based policy procedures allow to elaborate, through the political consensus based on the empirical evaluation, technically correct and politically acceptable proposals for any plausible future. On the other hand, an empirical policy frees us from thinking only on the basis of ideology and more in terms of what is practical. Today we live in a paradoxical situation: our social sciences feed on real policy data, but the opposite transit hardly flows. We would say that we have evidence-based policies. In this way, by allowing our policies to make poor use of

experimentation and evidence, we turn the exercise of governing into a permanent experiment.

# Evolution of Crisis Management

Abdul-Akeem Sadiq and Jenna Tyler
School of Public and Environmental Affairs, Indiana University-Purdue University Indianapolis (IUPUI), Indianapolis, IN, USA

## Synonyms

History of emergency management

## Definition

The evolution of crisis management refers to the history of the US emergency management system, dating from the early nineteenth century to the year 2015.

## Introduction

The theory and practice of crisis management has significantly evolved over the past century in the United States. This evolution is due in part to increases in the frequency, size, and scope of disasters, resulting in significant human, physical, and economic losses (Comfort et al. 2012). However, political events to include changes in administrations, world wars, and the rise and decline of national powers have also spurred this evolution (Lindell et al. 2001). For example, numerous policy and institutional changes have occurred in response to the Galveston Hurricane, Cold War, Three-Mile Island, 9/11, and Hurricane Katrina. Together, these events have helped develop and characterize crisis management as an essential subdiscipline within public administration (Comfort et al. 2012). To illustrate the development of this subdiscipline, this entry chronologically traces the historical evolution of crisis management in the United States by addressing major incidents, significant policy changes, and critical planning documents that have helped shape the theory and practice of crisis management today.

## Early History (1800–1950)

Prior to the nineteenth century, there was no organized response to disasters or emergencies (Federal Emergency Management Agency (FEMA) 2014). Instead, individuals and households carried out response activities by themselves or with the help of neighbors and/or local community organizations. For example, individuals and neighbors battled fires with rudimentary tools such as buckets and hoes, leading to the formation of *bucket brigades* (Coppola 2006). As the number of fires in large urban cities throughout the United States continued to increase, the efforts of *bucket brigades* and local governments became inadequate (FEMA 2014). As a result, the federal government became involved in assisting local communities affected by natural disasters (FEMA 2014). The earliest piece of federal disaster legislation occurred in 1803 with the passage of a Congressional Fire Disaster Relief Act. This act allowed the federal government to provide financial assistance to residents in Portsmouth, New Hampshire, who were affected by a major fire, which swept through the city (FEMA 2014). This reactive and ad hoc response by the federal government continued for much of the 1800s (Haddow et al. 2011). However, because major natural disasters in the early 1900s, including Hurricane Galveston that resulted in over 6000 fatalities, overwhelmed local response capabilities, the federal government created national level organizations to assist local communities in their response and recovery efforts. For example, in 1930, the Reconstruction Finance Corporation and the Bureau of Public Roads had the authority to provide disaster loans to public facilities to help with repairs and reconstruction. Similarly, the Tennessee Valley Authority emerged to help reduce flooding in the region (Haddow et al. 2011). One of the most significant pieces of crisis management legislation during this time was the passage of the Flood Control Act of 1936. This act had a profound impact on crisis management as it provided the US Army Corps of Engineers (USACE) with the authority to design and develop flood mitigation measures to stem future flood losses (Haddow et al. 2011).

Although these flood-control projects promoted economic and population growth along the country's rivers, history has shown that this approach was both shortsighted and costly (Haddow et al. 2011).

## The Civil Defense Era (1950s)

In the 1950s, federal preparedness initiatives focused on the Cold War and the potential risk of a nuclear attack engendered by the Soviet Union (Haddow et al. 2011; Lindell et al. 2001). In response, Congress passed the Federal Civil Defense Act (FCDA) of 1950, which made the Federal Civil Defense Administration an independent agency and gave it the authority to direct and coordinate federal disaster assistance efforts and war-related crisis planning. This act also confirmed that civil defense was a primary responsibility of state and local governments, causing civil defense programs to emerge throughout local communities. These local civil defense directors were the first recognizable face of crisis management in the United States (Haddow et al. 2011). To assist the FCDA, the Office of Defense Mobilization was established within the Department of Defense (DOD), with a focus on preparing for the mobilization and stockpiling of resources in the event of a war-related crisis. In addition to the establishment of these two agencies, Congress passed the Federal Disaster Relief Act of 1950 (FEMA 2014). This act allowed the president to review state governors' requests for federal assistance and decide whether to declare a major disaster and disperse federal funds (FEMA 2014). This act also reaffirmed that the federal government would support state and local governments, not supplant them. In 1958, the federal government merged the FCDA and Office of Defense Mobilization into the Office of Civil and Defense Mobilization to coordinate wartime activities (Haddow et al. 2011). Despite these governmental efforts, the US military questioned their ability to maintain social order in the aftermath of a potential or actual nuclear disaster (Lindell et al. 2001). This concern is how the field of disaster research came into existence as it prompted sociologists to begin studying individual- and community-level responses to disasters and the consequences of their response (Lindell et al. 2001). Hence, early empirical disaster researchers were interested in practical issues and not necessarily theorizing the social origins of disasters (Lindell et al. 2001).

## Changes in Crisis Management (1960s)

The focus of crisis management in the 1960s shifted from civil defense to natural disasters as a series of major natural disasters struck the United States (FEMA 2014). For example, the Ash Wednesday Storm in 1962 devastated the East Coast, producing over $300 million in damage (Haddow et al. 2011). Then, in 1964, a 9.2 magnitude earthquake shocked Alaska's Prince William Sound region, generating tsunamis down the Pacific Coast and resulting in 123 fatalities (FEMA 2014). Additionally, Hurricane Betsy in 1965 and Hurricane Camille in 1969 wreaked havoc along the Gulf Coast, killing and injuring hundreds of residents. The destruction engendered by these disasters and others proved that ad hoc legislation for disaster relief would no longer be effective. As a result, Congress passed the National Flood Insurance Act of 1968, which created the National Flood Insurance Program (NFIP). Unlike previous crisis management legislation, the National Flood Insurance Act coupled with the creation of the NFIP took a proactive approach, as they were developed to reduce flood risks prior to the next flood disaster (Haddow et al. 2011). This proactive approach expanded into disaster research as university-based research centers with the goal of reducing the human, physical, and economic losses to disasters through empirical research and evidence-based practices emerged in the 1960s (Lindell et al. 2001). For example, in 1963, E.L. Quarantelli, Russell Dynes, and J. Eugene Haas formed the Disaster Research Center (DRC) at Ohio State University. Since then, the center has moved to the University of Delaware. Almost a decade later, the University of Colorado Boulder established the Natural Hazards Center. The DRC, Natural Hazards Center, and other disaster

research centers continue to make significant contributions to the scientific understanding of hazards, risks, and disasters.

## The Development of FEMA (1970s)

By the 1970s, over 100 federal agencies were involved in some aspect of crisis management (FEMA 2014). However, five federal departments or agencies had the greatest authority. The Department of Commerce, for example, was responsible for weather, warning, and fire protection. The General Services Administration oversaw functions related to continuity of government, stockpiling, and federal preparedness. The Nuclear Regulatory Commission was responsible for securing power plants. The Treasury Department had authority over import investigations. Finally, the Department of Housing and Urban Development (HUD) was responsible for overseeing the NFIP. Additionally, with the passage of the Disaster Relief Act of 1974, HUD was responsible for assisting disaster relief efforts. This act established the process for presidential disaster declarations. However, in 1988, Congress amended the Disaster Relief Act of 1974, clarifying the disaster declaration process and renamed it the Robert T. Stafford Disaster Relief and Emergency Assistance Act.

The fragmentation and decentralization of crisis management functions resulted in state and local governments advocating for the establishment of a single federal agency that would lead all emergency management functions (FEMA 2014). This advocacy heightened on March 28, 1979, as a nuclear reactor partially melted down at the Three-Mile Island Nuclear Power Plant in Pennsylvania. This was the worst nuclear accident at a commercial nuclear power plant in US history and was the impetus for consolidating emergency management functions into one federal agency (FEMA 2014). In response, FEMA was created through the passage of Reorganization Plan No. 3 and President Jimmy Carter's Executive Order 12127 on April 1, 1979 (FEMA 2014; Sadiq et al. 2016). President Jimmy Carter appointed John Macy as the first FEMA director, despite his minimal emergency management experience. Under this reorganization plan, FEMA was considered the lead agency over all emergency preparedness, response, recovery, and mitigation function (Sadiq et al. 2016). Additionally, this plan transferred the following emergency management administrations, functions, and programs to FEMA: "National Fire Prevention Control Administration (Department of Commerce); Federal Insurance Administration (HUD); Federal Broadcast System (Executive Office of the President); Defense Civil Preparedness Agency (DOD); Federal Disaster Assistance Administration (HUD); the Federal Preparedness Agency (GSA); Earthquake Hazards Reduction Program (Office of Science and Technology Policy); Dam Safety Program (Office of Science and Technology Policy)" (FEMA 2014, p. 5). Although the majority of all emergency management functions were now under one umbrella, FEMA operated in silos, resulting in a disjointed agency (Haddow et al. 2011).

## An Agency in Trouble (1980s)

FEMA experienced many challenges during its infancy even though there were no significant natural disasters (FEMA 2014). For example, in 1981, President Reagan appointed General Louis O. Giuffrida as the second director of FEMA. Under his leadership, preparing for a nuclear attack became the top priority for the agency (FEMA 2014). Federal budgets and responsibilities were tailored with a national security focus, and because state emergency management agencies played a little role in national security initiatives, their federal funding diminished (Haddow et al. 2011). Congress then began investigating FEMA's roles and responsibilities as well as how senior political officials distributed government funding. Because of these investigations, Giuffrida and his top aides resigned (FEMA 2014). By 1984, FEMA suffered from inherently organizational and political issues, causing Congress and senior administrative officials to have little respect for the agency (Comfort et al. 2012). In an attempt to professionalize the field of crisis

management, FEMA collaborated with the National Association of Schools of Public Affairs and Administration (NASPAA) to build a network of professionals and researchers who could address the challenges impacting emergency managers at all levels of government (Comfort et al. 2012). This initiative led to a 1984 workshop for researchers and practitioners that aimed at developing programs to advance educational opportunities, establishing a research agenda for the field, and introducing programs to build the human resources necessary to meet the network's goals (FEMA 1985). The workshop also prompted professional societies like the American Society for Public Administration (ASPA) to develop a section on emergency and crisis management (Comfort et al. 2012). By 1985, President Reagan appointed General Julius Becton as the third FEMA director. Similar to his predecessor, Becton continued to emphasize the importance of nuclear preparedness, placing natural disaster preparedness at a low priority (FEMA 2014). Members of Congress expressed a concern over FEMA's priorities and ability to coordinate federal response efforts. Two devastating hurricanes confirmed members of Congress' concerns and called into question the purpose of FEMA's existence (FEMA 2014). In September of 1989, Hurricane Hugo devastated both North and South Carolina, resulting in over $15 million in damages and 85 fatalities. Less than a month later, the Loma Prieta earthquake shocked the San Francisco Bay Area during the World Series. In both incidents, the affected local and state governments heavily criticized FEMA's response, arguing that FEMA was slow to respond with financial and physical resources. By the end of the 1980s, FEMA had considerable morale problems, inconsistent leadership and direction, and poor relationships with the state and local governments (FEMA 2014).

## The Witt Revolution (1990s)

The early 1990s further revealed that FEMA was ill prepared to handle large-scale disasters (FEMA 2014). For example, in August of 1992, Hurricane Andrew struck Florida and Louisiana coasts and destroyed roughly 82,000 businesses, resulting in the loss of approximately 86,000 jobs (Hartwig 2002). Then, Hurricane Iniki struck Hawaii in September 1992, affecting over 14,000 homes and resulting in over $3 billion in damages. Despite the development of FEMA's Federal Response Plan in 1992 that outlined the federal government's response processes, FEMA was again slow to respond. As a result, during FEMA's reauthorization hearings in 1992, Congress debated disassembling the agency (Comfort et al. 2012). However, Congress' doubt subsided once President Bill Clinton appointed James Lee Witt as the fourth FEMA director in 1993. Witt was the first FEMA director with extensive emergency management experience, having been the former director of the Arkansas State Emergency Management Agency. Witt's tenure at FEMA became known as the *Golden Age of FEMA* as he created a culture of transparency, implemented customer service training, and developed strong connections with state and local counterparts through the ten FEMA regional offices (FEMA 2014; Sadiq et al. 2016). Witt also embraced the all-hazards approach to crisis management by developing a basic framework for responding to a variety of hazards rather than focusing all efforts on one single hazard or risk. Additionally, President Bill Clinton elevated the FEMA director to a cabinet-level position. This action signified that crisis management was a top priority (FEMA 2014).

Under Witt's leadership, FEMA was able to successfully respond to a number of major natural disasters to include the Midwest Floods in 1993 as well as the Northridge Earthquake in 1994. Because of the devastation engendered by these and other disasters, Witt focused on hazard mitigation and helped pass the Hazard Mitigation and Relocation Act of 1993, which gave FEMA greater authority to reduce community flood risks. However, the first bombing of the World Trade Center in February of 1993 and the Oklahoma City Bombing in April of 1995 elevated the threat of terrorism. Because of these incidents, there was great debate on what agency would be the lead agency in preventing future terrorist attacks and protecting the nation's vital interests.

As this debate progressed, Witt continued to emphasize the importance of hazard mitigation by launching Project Impact. The ultimate goal of this program was to build disaster-resilient communities by incorporating risk-management and risk-avoidance practices into local community's decision-making processes (Haddow et al. 2011). By the end of the 1990s, FEMA had restored its reputation.

The 1990s also attracted new scholars to the study of crisis management (Comfort et al. 2012). For example, in the mid-1990s, the National Science Foundation introduced the Enabling the Next Generation of Hazards and Disasters Researchers. As of today, the program has mentored four cohorts of new disaster researchers who have significantly contributed to the study of hazards, risk, and disasters. Additionally, the field of crisis management is becoming more professionalized as undergraduate and graduate degree programs emerged throughout the United States (Waugh and Sadiq 2011).

## Terrorism Centric (2000–2004)

The start of the new millennium began with President George W. Bush taking office and appointing Joe Allbaugh to be the fifth FEMA director in February of 2001. Like other FEMA directors, Allbaugh had political ties to the president but had no emergency management experience (Haddow et al. 2011). Under Allbaugh's reign, the Project Impact was discontinued because the Bush administration had doubts regarding the efficacy of the program (Haddow et al. 2011). This decision shocked much of the crisis management community as Project Impact had provided a number of communities with the funding to implement projects aimed at mitigating and preparing for natural disasters (FEMA 2014).

The terrorist attacks on September 11, 2001, drastically shifted FEMA's preparedness priorities from an all-hazards approach to a terrorism-centric mindset. Additionally, this incident led to several immediate and radical policy and institutional changes within the federal government (Birkland 2009; Hu et al. 2014). Arguably, the greatest change was the passing of the Homeland Security Act of 2002, which merged 22 agencies, including FEMA, and over 179,000 governmental personnel to form the Department of Homeland Security (DHS) (Haddow et al. 2011). The inclusion of FEMA under DHS diminished FEMA's funding and capacity to respond to natural disasters (Gerber 2007; Waugh and Tierney 2007).

In 2003, Pennsylvania Governor Tom Ridge was appointed as the first Secretary of Homeland Security. To help guide and mobilize domestic homeland security efforts, DHS developed a series of strategic planning documents such as the *Homeland Security Strategy of 2002*, with a primary focus on terrorism. Three years after the 9/11 terrorist attacks, DHS transformed the Federal Response Plan of 1992 into the National Response Plan of 2004. The NRP placed a greater emphasis on terrorism prevention and increased the number of Emergency Support Functions (ESFs) from 12 to 15 (Birkland 2009; Hu et al. 2014). ESFs are used to provide structure for coordinating interagency support to respond to an incident and are staffed by a representative from a public, private, or nonprofit agency who serves as a technical expert for the management and oversight of that particular ESF (FEMA 2008). Yet one of the most notable additions to the NRP was the establishment of the National Incident Management System (NIMS). NIMS provides a common framework for incident management regardless of cause, size, or complexity. Together, these changes resulted in FEMA and DHS focused on addressing the risk of an imminent terrorist threat.

## The Hurricane Katrina Debacle (2005–2009)

FEMA's focus shifted again in August of 2005 as Hurricane Katrina devastated New Orleans, Louisiana, and Bay St. Louis, Mississippi, among other cities, resulting in over 1800 fatalities and over $100 billion in disaster relief expenditures (Haddow et al. 2011). The poor and slow response to Hurricane Katrina by all levels of government suggested that FEMA along with DHS had placed

too much emphasis on terrorism, neglecting the potential for catastrophic natural disasters (Birkland 2009). The political fallout by this failed response resulted in Michael Brown, the FEMA director appointed in 2003, resigning. In an attempt to determine the necessary corrective actions, the federal government conducted a thorough evaluation of the incident. This evaluation led to Congress passing the Post Katrina Emergency Management Reform Act (PKEMRA) of 2006, which significantly reorganized FEMA and developed a more robust preparedness system by establishing the National Emergency Family Registry and Locator System and developing procedures to handle pets during evacuations, among other changes (Townsend 2006). Additionally, DHS allocated funding to the study of coastal disasters by developing the Coastal Hazards Center of Excellence at the University of North Carolina at Chapel Hill and Jackson State University. Finally, in 2009, FEMA replaced the NRP with the National Response Framework (NRF) to strengthen interorganizational and cross-sector collaborations (Hu et al. 2014). The NRF also refocused the nation's response processes back to an all-hazards approach, emphasizing the role of state and local governments as well as nonprofit and private organizations in crisis management (Hu et al. 2014). By the end of this era, President Barack Obama took office and appointed Florida's State Emergency Management Director, Craig Fugate, as the new FEMA Director in 2009. Fugate's focus has been on creating a culture of preparedness and rebuilding partnerships with state and local emergency management agencies.

## Crisis Management Today (2010–2015)

The United States has been impacted by a variety of natural and man-made disasters over the past 5 years, reaffirming the need for an all-hazards approach. For example, Hurricane Sandy in October of 2012 wreaked havoc along the East Coast and the Boston Marathon bombings in April of 2013 tested multiagency response systems. In the aftermath of Hurricane Sandy and the Boston Marathon bombings, FEMA's response and the response of local first responders, respectively, were highly praised (Hu et al. 2014; Sadiq et al. 2016). Additionally, Presidential Preparedness Directive 8 introduced the National Preparedness Goal, which stressed the need for the whole community to work collectively to prevent, protect against, mitigate, respond to, and recover from the threats and hazards that pose the greatest risk (FEMA 2015). In 2013, FEMA revised the NRF to include the whole community approach to crisis management (Hu et al. 2014). The whole community approach underscored the need for government, businesses, faith-based and nonprofit organizations, and the community to work together to develop the tools necessary to address the threats and hazards impacting their community (Kapucu et al. 2013). More recently, policymakers have modified the whole community approach to the all-of-nation approach, which emphasizes the need for all citizens and nonprofit and private organizations to advance the preparedness process, share information, and optimize the use of available resources (Egli 2014). Put together, the current changes in crisis management have stressed the need for coordination and collaboration rather than command and control (Hu et al. 2014).

## Conclusion

This entry traced the historical evolution of crisis management in the United States by discussing major incidents, significant policy changes, and critical planning documents that have influenced the theory and practice of crisis management. Although the maturation of the field has been described as a "slow and torturous process" (Farazmand 2001, p. 357), there is a hopeful future (Haddow et al. 2011). For example, it is likely that greater efforts will be made to enhance cross-sector collaborations by engaging nonprofit and private organizations. It is also likely that technological advancements (e.g., GIS and social media) will strengthen organizational operations by enhancing information sharing and responsiveness of crisis management organizations. Finally, it is likely that crisis management will be given a

higher priority as the realities of climate change are becoming more pronounced. Although only time will tell how the field of crisis management will evolve in the coming years, current efforts suggest that the field will only become more proactive at creating disaster-resilient communities.

## Synonyms

Government financial reporting reform; International harmonization of public sector accounting; Movement from cash to accrual accounting; New Public Financial Management; Public sector accounting change; Reform of financial information systems

## Definition

Government accounting is the process of recording, reporting, and evaluating transitions and

events affecting government's finances. It's a social and institutional practice which deals with fraud and waste in order to protect public treasury, facilitate good financial management, and discharge public accountability.

## Introduction

Over the last decades, major changes have been introduced in government accounting under what is known as the New Public Financial Management (NPFM) reforms. Considered as a fundamental element of the New Public Management (NPM), NPFM is a global movement that focuses on financial aspects and accounting practices in the public sector (Guthrie et al. 1999). It involves the integration of private sector financial reporting techniques in government accounting practices. NPFM reforms seek to improve transparency and accountability, fight corruption, facilitate auditing, and increase public sector performance. The move from cash-based to accrual-based accounting and the harmonization of financial reporting are considered the most significant changes in government accounting and the main trends of the NPFM reforms (Christiaens et al. 2015).

The purpose of this entry is to provide a brief overview of government accounting evolution and its main changes. It begins with a discussion of the historical context of public sector accounting reform. It then highlights the shift from cash to accrual accounting. Finally, it analyzes the international harmonization process of government accounting and the development of International Public Sector Accounting Standards (IPSAS).

## Historical Background and Perspectives of Government Accounting Reform

During the 1980s, the public sector has been a subject of criticism for politicians, academics, private sector representatives, and citizens who pinpointed the ineffectiveness and failure of traditional public financial management. The need to disclose a reliable and transparent financial reporting has increasingly become demanding to assist in decision making and ensure proper management. Under traditional model of government accounting, it is argued that cash-based accounting system reveals some drawbacks. Indeed, the existence of incomplete and inaccurate information on financial transactions, the weakness of performance parameters and more generally the presentation of an unrealistic picture of public entities' financial position are major sources of corruption and government accounting failure. These factors are important features of the socio-economic underdevelopment of several countries (Enthoven 1988).

In the public sector, enhancing financial accountability is based on an improvement of financial information which requires an effective management system by adopting new techniques (accrual accounts, performance measurement, devolved budgets, transparent costing, etc.) (Olson et al. 2001). NPFM is a key part of the New Public Management (NPM) reforms that began in the 1980s and tended to reorganize the public administration and management (Hood 1995). Based on the use of private sector accounting practices, NPFM aims to provide useful and accurate information for different users (Christensen 2010).

Guthrie et al. (1999) distinguish five categories of NPFM reforms which are presented in Table 1.

Although it is considered as a global phenomenon, the NPFM can be neither useful nor applied in the same way for all countries. Despite its promised benefits, the sophisticated design of this financial management style still poses some limitations. According to Olsen et al. (2001), the application of private sector accounting techniques may generate an increase in indirect costs related to the evaluation activities. As a result, public sector organizations may be led to reduce direct costs, thereby limiting the provision of public services. Bowerman (1998) highlights the existence of some confusion and inconsistency in the thoughts and concepts that require more clarity and anticipation before a reform implementation. According to this author, there may be a contradiction between formal regulations and practical techniques.

**Evolution of Government Accounting, Table 1** Categories of NPFM reforms as identified by Guthrie et al. (1999)

| NPFM reform category | Description |
|---|---|
| 1. Changes to financial reporting systems | Promotion of accrual-based accounting and reliance on professional accounting standards |
| 2. Development of commercially minded, market-oriented management systems, and structures | Focus on cash management, quality, and pricing of public services, outsourcing arrangements and internal and external charging/pricing mechanisms |
| 3. Development of a performance measurement approach | Emphasis on financial and nonfinancial performance indicators, benchmarking, and performance measures |
| 4. Devolvement/ decentralization or delegation of budgets | Introducing financial and management accounting systems and focusing on economic-based information sets. More stress on the link between budgets and the reporting of financial and nonfinancial results |
| 5. Changes to internal and external public sector audits | More emphasis on monitoring service delivery functions as well as efficiency and effectiveness of public services |

Source: Guthrie et al. (1999)

NPFM reforms dramatically imply important innovations in government accounting. The move to accrual-based accounting and the international accounting harmonization are the most significant changes.

## Movement from Cash to Accrual Accounting

Cash basis and accrual basis are two main accounting methods in the public sector accounting. The first technique measures cash flows at the time those flows actually take place. In the second method, transactions are recorded when they occur regardless of when actual cash is received or paid (Ruppel 2005). The main differences between cash basis and accrual basis are summarized in Table 2.

The move to accrual-based accounting is one of the fundamental objectives sought by NPFM reforms (Guthrie et al. 1999; Rossi et al. 2016). Indeed, this change in government accounting is mainly associated with the following factors:

- Growing awareness of pure cash accounting drawbacks
- Need to improve accountability and financial reporting quality to fight corruption
- Impact of NPFM reforms on government accounting and introduction of private sector techniques
- Development of accrual-based international standards including Government Finance Statistics Manual (GFSM) and IPSAS
- Interest of international financial institutions and their key role in the spread of accrual accounting to the public sector
- Development of computerized financial management information systems (FMISs) which dramatically contribute to the reduction of transaction costs related to collecting and consolidating accrual-based information

According to the European Commission (2013), the trend toward accrual accounting does not seek to replace or limit the use of cash accounting which is still fundamental for budgetary control in several countries. Unlike cash-based accounting, proponents argue that accrual accounting provides essential and accurate information about government solvency, noncash transactions, patrimonial goods, and public services' costs (Pina and Torres 2003; Hyndman and Connolly 2011). It offers a broader measure of the burden of government's financial commitments than does the cash basis accounting. Since the late 1980s, there has been a growing tendency toward accruals-oriented public sector accounting by governments such as New Zealand and Australia (Hyndman and Connolly 2011). It is asserted that this method contributes to the improvement of government financial performance. It increases the transparency and reliability of financial information. It therefore promotes

**Evolution of Government Accounting, Table 2** Distinction between cash-based and accrual-based accounting

| Distinguishing criterion | Cash-based accounting | Accrual-based accounting |
|---|---|---|
| Appropriate model | Traditional model of public administration accounting/ or budget accounting | Modern model of public sector accounting |
| Main emphasis | Compliance with rules and regulations | Public management efficiency |
| Recording of transactions | Until cash is actually received or paid | When transactions become due |
| Aligning with the "matching concept" | Expense is not recorded in the same period as the income to which it is related | Expense is matched with the revenue it generates |
| Usefulness for economic and investment decision-making | Weakness of performance parameters | Availability of performance parameters |
| Level of simplicity and comprehensiveness of accounting method | Simple and easy to operate | Complicated and difficult to operate |
| Complexity level of financial statements | Financial statements are very understandable and not complicated<br>Nonrequirement for making depreciation, provisions or adjustments for accruals, and prepayments | Financial statements are more complicated and difficult to be understood<br>Making depreciation, provisions, and adjustments for financial statements |
| Picture of public sector entity's financial position and performance | Unrealistic picture of financial transactions | Realistic and more accurate view of financial transactions<br>Accurate information makes it easier to predict future income and financial position |

Source: Guthrie (1998), Ruppel (2005)

better financial planning and improves accountability (Gomes et al. 2015). According to Rossi et al. (2016), accrual accounting has become at the center of international standardization process since it enables to satisfy investors' and markets' information needs, facilitate commercial exchanges, and increase the confidence of private sector partnerships.

However, some authors argue that accrual accounting cannot be adequate to the public sector specificities. According to Guthrie (1998), financial structure and solvency are not relevant in the context of public sector. Since profit is not the main objective of public organizations, it cannot be an effective performance measure. Furthermore, this method is limited to providing narrow information on performance with more emphasis on cost of services and efficiency. Hepworth (2002) states that accrual accounting may worsen underlying financial control problems because it leaves a greater margin of judgment.

Previous studies have investigated the introduction of accrual accounting in the public sector in countries such as Australia (Guthrie 1998), New Zealand (Newberry and Pallot 2004), Sweden (Paulsson 2006), UK, and Republic of Ireland (Hyndman and Connolly 2011). The content of government accounting reforms and the application of accrual accounting differ from one country to another due to the differences in the local specificities and conditions of each government. These reforms differ even among government's different levels within the same country. This is likely to increase the international divergence of accounting practices in the public sector between governments. This diversity in accounting systems has created the need for harmonizing accounting practices in the public sector in order to increase the comparability and transparency of public organizations' financial statements.

## International Harmonization of Public Sector Accounting

Transparency and accountability are key elements in terms of financial reporting. In the absence of transparency, it becomes difficult and more complicated to make politicians, bureaucrats and various governmental entities accountable for their decisions and actions (Bovens 2007). In times of

financial crises, there was an increasing need for transparency and accountability in financial reporting in the public sector. The European Commission (2013) stressed the need for governments to demonstrate financial stability and greater transparency in their financial statements. Hence, the harmonization of public sector accounting practices is needed to ensure the comparability and increase the transparency of government's financial statements. Benito et al. (2007) argue that the trend toward harmonizing government financial reporting is generally stimulated by:

- Externalization of financial activity of public administrations accentuated by the globalization effect
- Need for enhancing transparency and accountability in the public sector
- Need for carrying out comparisons among public administrations of countries with similar characteristics and facilitating the analysis of their financial situation which requires comparable financial reporting
- Need to assist less developed countries in the generalized modernization of their accounting systems
- Need to facilitate the task of public international organizations which use financial reporting from different governments

In recent decades, the International Public Sector Accounting Standards Board (IPSASB), operating under the International Federation of Accountants (IFAC), has played a major role in the field of government accounting harmonization. The Board's mission focuses on the accounting, auditing, and financial reporting needs of governments and other public sector entities. Since 1996, the IPSASB has developed and issued a unique set of standards (IPSAS) for use by the public sector enterprises across the world (Aggestam-Pontoppidan and Andernack 2016). The main events related to the evolution of international accounting harmonization in the public sector are summarized in Table 3.

Based on the international accounting standards (IAS/IFRS), IPSAS are high-quality standards designed to achieve the following objectives:

- Enhancing the quality, transparency, and comparability of financial reporting for public sector entities
- Improving financial accountability and facilitating auditing of public sector organizations
- Strengthen governance procedures
- Enhancing consistency in the preparation and reporting of financial information
- Improving financial reports' interpretation and assisting in decision making

Several international organizations such as the World Bank, the International Monetary Fund (IMF), and the Organization for Economic Cooperation and Development (OECD) have played a supporting role in the worldwide acceptance and diffusion of these standards. The first adopters of IPSAS were the OECD and the NATO (North Atlantic Treaty Organization) in 2000 and 2008, respectively. Conscious of the importance of budgeting and cash accounting in several countries, the IFAC has established a cash basis standard (cash basis IPSAS). Furthermore, a guide on the transition to accrual basis IPSAS was developed in order to harmonize the public sector accounting with the private sector one. The two types of IPSAS are briefly defined in Table 4.

The number of IPSAS currently stands at 40 standards which are closely linked to the IASB's standards (IAS/IFRS) in order to ensure the comparability of financial reporting for similar transactions between the public and private sectors. However, given that each type of standards is designed to be used in two different contexts, IPSASs and IFRSs differ considerably in several areas because of many reasons:

- Two different scopes: IFRSs are intended for profit-oriented enterprises while IPSASs are developed for use by entities whose primary purpose is to provide basic services in order to improve and maintain the citizens' welfare level
- The changes made by the IPSASB to IFRS in order to adapt them to the specificities of the public sector
- Difference in timing of introducing new alterations or new requirements to each type of standards

**Evolution of Government Accounting, Table 3** Evolution of the international harmonization of public sector accounting

| Date/year | Event(s) |
|---|---|
| October 7, 1977 | Creation of the international and private standard-setting organization (IFAC) in Munich (Germany), at the 11th world congress of accountants, with the aim of developing and enhancing a worldwide accounting profession and high-quality harmonized standards |
| June 1986 | Creation of the public sector committee PSC (the fifth IFAC committee) devoted to the public sector accounting |
| January 1987 | Organization of the first PSC meeting in London to define the role of the PSC |
| 1996 | Launch of the program for the development of a unique set of international accounting standards for use in the public sector (IPSAS) |
| 1998 | Publication of the PSC initial draft reporting guidelines for comment |
| May 2000 | Publication of the first international public sector accounting standards (IPSAS) based on IAS/IFRS and including the accrual-basis method |
| End of 2001 | Development of 17 standards (IPSAS) on the basis of IAS/IFRS |
| 2002 | Initialization of the second phase of the IPSAS program including 12 standards, four of which are specific to the public sector (IPSAS 22, IPSAS 23, IPSAS 24 and IPSAS 32) |
| 2003 | Conducting a review panel (by the IFAC) known as the "Likierman review" following which a recommendation of relaunching the PSC as the IPSASB was proposed |
| 2004 | Reconstitution of the PSC as the IPSASB that represents an independent accounting standard-setter in the public sector, operating under the auspices of the IFAC |
| November 2011 | Announcement of the agreement between the IFAC and the international accounting standards board (IASB) with the aim of strengthening cooperation between the two bodies in developing public and private accounting and financial reporting standards |
| October 31, 2014 | Publication of the IPSASB's conceptual framework entitled "the conceptual framework for general purpose financial reporting by public sector entities" in order to establish and explain the fundamental concepts on which are based the general purpose financial reporting by public sector entities adopting the accrual-based accounting method |

Source: Aggestam-Pontoppidan and Andernack (2016)

**Evolution of Government Accounting, Table 4** Cash basis IPSAS versus accrual basis IPSAS

| Cash basis IPSAS | Accrual basis IPSAS |
|---|---|
| Cash basis IPSAS standard deals with the manner in which the general purpose financial reporting (GPFRs) should be presented under the cash basis accounting<br>Cash basis IPSAS, which was first issued in January 2003, includes two parts; the first examines mandatory reporting requirements and the second addresses encouraged disclosures to support information reported under part 1<br>Such IPSAS mainly focuses on financial reporting of cash receipts, payments, and balances | Most of the IPSASB's standards are on accrual basis that is in line with IFRS<br>Accrual basis IPSAS standard deals with the manner in which the general purpose financial reporting (GPFRs) should be presented under the accrual basis accounting<br>It focuses on assets, liability, revenue, cost, and equity instead of cash flow only<br>Accrual basis IPSAS helps strengthen public financial management by ensuring good asset and debt management and improving service performance and long-term fiscal sustainability |

Source: Aggestam-Pontoppidan and Andernack (2016)

- Differences in the treatment of a particular type of transaction (example: nonexchange transactions)

Although they do not have the same scope, the IASB and the IPSASB do not operate separately; there is a close relationship between the two international standards-setting bodies which publicized in November 2011 an agreement formalized by a Memorandum of Understanding (MoU) (Muller-Marques Berger 2012). The MoU mainly deals with the relationship and the cooperation between the IPSASB and the IASB. In addition, the IPSASB builds on the principles of the IASB's

standards by adapting them to the specificities of the public sector in order to develop its IPSAS. The accrual-based IPSAS focuses on public sector accounting issues that have never been addressed and/or have not been clearly examined by IAS/IFRS. Thus, the accrual-based IPSAS ensures the convergence between IPSAS and IFRS by adapting the IASB standards to the specificities of the public sector accounting. In this regard, the IPSASB published in October 2008 a paper entitled "*Process for reviewing and modifying IASB documents*" which highlights the process of convergence between IPSAS and IAS/IFRS (Aggestam-Pontoppidan and Andernack 2016).

## Conclusion

The international harmonization of financial reporting and the growing move toward accrual-based accounting have been the major changes in government accounting in the last decades. These changes are seen as the main trends of an ongoing NPFM reforms agenda seeking to develop a more performance-based public sector.

This entry has provided an overview of the evolution of government accounting in recent decades. It began with a discussion of the historical background and perspectives of government accounting revolution as a key part of the NPFM reforms. Next, this entry examined the trends, purposes, and limitations of the transition to accrual-based accounting in the public sector.

Finally, this entry discussed the interest of harmonizing the public sector financial reporting and the main events related to the evolution of the international government accounting harmonization. It also underlined the key role of the IFAC, the IPSASB and the different international organizations in the development and the spread of high-quality international public sector standards (IPSAS) that meet the new market requirements as well as stakeholders' information needs. Moreover, this entry highlighted the relationship between the IPSASB and the IASB and their major role in the field of international accounting harmonization.

## Description/Definition

Kenya's postindependence political scene has been characterized by continued efforts to structure and restructure the country's political system on the one hand and prodemocratic struggles on the other. Despite the importance of political systems in understanding and implementing public administration and governance in a given country, most studies on Kenya's politics have focused on the role of gender and electoral violence. This study aims to examine the status and evolution of Kenya's political system and some hindrances to a successful transition to democracy. It argues that Kenya's political system has continuously been shaped by practices adopted from other countries but sometimes varies during implementation. The chapter divides contemporary Kenya's politics into pre- and post-2010. It identifies issues such as ethnicity, lack of homegrown political system, fake news, populism, and weak institutions as serious threats to the country's democracy.

## Introduction

Kenya, a country located in the eastern part of Africa with its capital city Nairobi, was formerly a British colony for over 150 years. Up until 1963, the country whose native population comprises over 45 different ethnic groups that differ in size, origin, history, race, tribe, and religion was all together exploited, disenfranchised, and discriminated in their land by the European imperial powers (Sheriff 1985). United with a common believe and ambitions, the tribes joined forces and mounted a serious anti-colonial campaign. This resistance was characterized by violence (Mau Mau Rebellion that began in 1952), civil unrests (protests, demonstrations, boycotts, and strikes organized by trade unions), diplomacy (through petitions to the United Nations), and negotiations (several meetings held in Nairobi and Lancaster in London) against the British which led to the independence of Kenya in December 1963. Independence celebrations were short-lived as the

country begun to face experience similar problems as those witnessed during the colonial periods only that this time the perpetrators were fellow Africans. Kenya's first constitution adopted at independence was a Westminster model that was written in London following a series of meetings that saw representatives of different political parties from Kenya and the British Foreign Affairs Office department responsible for overseas colonies meet and negotiate. In 1963 the first autonomous general election was conducted, and Kenya African National Union (KANU) won against Kenya African Democratic Union (KADU).

Notably, between 1963 and 1964, Jomo Kenyatta of KANU became the first black Prime Minister of Kenya, and the Queen of England (Queen Elizabeth II) remained as the Head of State. KANU had supported a presidential system during the constitution-writing process in London, while KADU was supporting the parliamentary system (Hodder-Williams 1980: 477–479). Less than 1 year (1964) after winning the elections, the KANU-led government changed the constitution of the Westminster model to a presidential system (Muigai 2004: 201–203; Malhotra 1990: 7). Kenya remained under a presidential system until 2007 when a crisis broke out following a disputed general election (Francois et al. 2015: 471). There was a consensus even in the early 1990s that the country needed a set of new rules (constitution) since the existing constitution, which was put in place at independence, had undergone several amendments that gave rise to a dictatorial regime that ruled for 27 years under one president.

Until 2007, Kenya had been one of the most peaceful and stable countries in the continent of Africa (Orobator 2008; Githongo 2010: 89; Githongo 2008: 361; Kanyinga 2009). This made Kenya the first choice for tourists, foreign investors, international organizations, as well as multinational corporation who wanted to operate in the region and beyond (Holland 2008). Following the disputed general election in December 2007, there emerged legitimate fears that the country would collapse into a prolonged civil war (Gettleman 2007). Although the violence was short-lived after a Kofi Annan and US-led brokered peace deal that led to the formation of a coalition government, over 800 people had lost their lives, more than 2000 were internally displaced (IDPs), and properties of disproportionate value were destroyed (Roberts 2009: 142; Dercon and Gutiérrez-Romero 2012: 738–740).

Ironically, while the 2007 post-election violence is considered one of the most violent periods postindependence Kenya, it is credited as laying the foundation for a road map to one of the most significant events in the country's history. This is the discussion, drafting and passing of a new constitution in 2010. As part of the power-sharing agreement in 2008, the coalition government was expected to deliver a new constitution to the people of Kenya before the next election cycle. Prior to the 2007 election, calls for a new constitution in the country were not successful, and any amendments made on the constitution in the 1990s only functioned to strengthen the executive arm of the government and disenfranchises certain segments of the society (Ndulo 2003; Chege 2008: 126–129; Ndegwa 2003: 146–149; Akech 2010: 12). After the 2007 post -election violence, the country was ripe for change and a strong wave for a new constitutional era that would ensure inclusive, fair representation of women, and youths as well as decentralization of resources and authority had begun in earnest.

Although changing the constitution has not led to a vibrant democracy in Kenya, the country has managed to rise from "not free" in 1990 to "partly free" in 2018 according to the Freedom House reports. This has been attributed to several political, social, legal, and economic reforms enshrined in the new constitution. However, this transition has not been easy as pro-democracy activists and politicians were either imprisoned, intimidated, or assassinated, especially in the 1990s, while lack of institutional independence, corruption, and nepotism continue to hinder further reforms. Democracy is a continuous process that can be considered as a means to an end and not an end in itself. It is the fruits of democracy that Kenyans

deserve and not simply the status of being a democratic country. The pre-2010 constitution structure will now be examined.

## Pre-2010 Political Structure in Kenya

Between 22 August 1978 and 30 December 2002, Kenya had one single president – Daniel Moi – who had managed to strengthen the office of the president through several amendments of the constitution and presidential decrees and declarations (Nepstad 2011; Wolf 2006: 198–199; Khapoya 1980: 17). The president had control over parliament, judiciary, and electoral commission. The president had powers to dissolve the parliament and appoint commissioners of the judicial service commission and high court judges and also had full control over the national budget (Nepstad 2011; Branch and Cheeseman 2008: 3). This system resembled the British colonial regime state structure that saw most of the state powers concentrated in the hands of one person, the governor who was the representative of the Queen of England based in Kenya.

Similar to the colonial structure, the president was responsible for the appointment district and provincial commissioners who were responsible for overseeing the distribution of various state resources functions such as health, education, security, and transport (Berman 1976). This means that at the time, the political system was highly centralized with little independence for local government authorities and even less participation by the citizens on policy and decision-making processes. Similar sentiments are echoed by the director of the African Studies Centre at Oxford University, David Anderson, who opines that the situation in Kenya at that time could be best described as "a shadow government entirely in the control of the president" (Sonoiya 2018: 3). Systematic targeting of regions perceived to be supportive of the opposition parties, or with opposition parliamentarians, would tend to receive fewer resources than those controlled by the ruling party. Such practices jeopardized the democratic nature of the country.

Public institutions in Kenya before 2010 were seen not responsive enough to the people's needs, perhaps due to the excessive control by the executive and in particular the office of the president. For example, although the members of the parliament were directly voted for by the people, the institution of the parliament was under the control of the executive, with the president having the power to dissolve the parliament at his digression. A Kenyan professor at Harvard University's international development department, Calestous Juma, puts it as "when voters realize elected officials aren't going to address their concerns about social and economic inequality, it leads them to distrust institutions and produces a sense of disempowerment and disillusionment" (Juma 1998). The loss of trust in public institutions widened the gap between the government and the governed.

Corruption, which was widespread in the political sphere, further worsened the trust levels in public institutions. President Obama described the extent of corruption in Kenya during his ancestral home visit in Kenya (2006). He stated that "corruption has eroded the state from inside out, sickening the justice system so that no justice can be found; poisoning the police forces so that their presence becomes a source of insecurity rather than a source of security" (Gettlemanaug 2006). Indeed, a report published by the Transparency International corruption report in 2007 ranked Kenya number 150 out of 180 in the international corruption index (Transparency international report 2007). Due to corruption, Kenyan institutions were weakened to the extent that democratic values such as independence of the judiciary or the legislature, minority representation, free and fair elections, as well as human rights could not be achieved.

Consolidation and excessive control of power by the executive arm of the government have been facilitated by the election system of winner-takes-all in Kenya. This raised the stakes at the ballot that forced aspirants and their supports to seek or condone electoral malpractices. Although there have been periodic elections, they were never free or fair according to post-election reports by domestic and international observer groups, particularly in 1992, 1997, and 2007. Alleged

interference by the executive on the outcome of election results not only compromised the basic tenets of democracy but also often resulted in violence, destruction, and loss of life and property (Kagwanja 2001: 547–550). Since 1992, there has been plurality in election processes in Kenya where several political parties would participate. However, after losing elections, the opposition parties had very little participation in public affairs. Losing the election means being alienated from development projects, employment, and even justice. Elections have been seen as a high-stakes issue in Kenya, and therefore politicians have resulted in using several means to win the election, including corruption, manipulation of results, violence, and intimidation (Kagwanja 2003: 25–29). The passing of the 2010 Constriction was a landmark step in the democratization process in Kenya. In the next section, Kenya, under the new constitution, will be examined.

## Post-2010 Kenya

The Constitution of Kenya 2010 was expected to be the biggest milestone toward achieving democracy in Kenya (Kramon and Posner 2011: 89–94; Barkan and Mutua 2010; Hassan 2015). The process of writing the new constitution was tedious and time-consuming, however very inclusive, and this fueled much of the hopes among the citizens. The committee of experts sought the opinion and contribution of citizens, professional organizations, religious groups, special interest groups, civil society, academicians, and media practitioners and factored into the draft constitution that was then subjected to a referendum in 2010. 68.7% of the Kenyan electorate voted yes in favor of the new constitution, while 31.3% voted against. The overwhelming support for the new constitution received can best be understood by looking at the expectations Kenyans had on the constitution (Gichuki 2016). Rightfully so given that enshrined in the new constitution were vital elements of democracy, good governance practices, and inclusivity. The constitution also became much more ridged to unnecessary changes. For example, the previous constitution gave power to the National Assembly (parliament) to amend the constitution. At the time, the three organs of government (executive, legislature, and judiciary) were closely interrelated and controlled by the executive. This gave room for contentious and malicious amendments to the constitution that benefited the ruling elite and plunged the country into dictatorship (Bannon 2006; Adar and Munyae 2001: 2–6). The new constitution was therefore seen as an enduring solution to executive dominance of other arms of government as well as abuse of state power by a few individuals.

Other important issues that the new constitution of 2010 sought to address include the president's power to appoint public office holders without them being vetted by the parliament, issues of electoral justice as the previous constitution failed to provide proper mechanisms, and guarantees of fair resolution of disputes arising from elections. After the new constitution, opposition parties were able to file a petition with the supreme court about the fairness of the 2013 and 2017 presidential elections. In 2017, a landmark ruling made by the Supreme Court of Kenya when it nullified the presidential elections based on the evidence presented that showed irregularities took place and ordered for a fresh election can be credited to the new constitution. The various security agencies, particularly the military, intelligence, and the police, were not regulated by the constitution in the past and were serving in the interest of the president. The new constitution introduced a civilian oversight body (Independent Police Oversight Authority (IPOA) – Kenya) and changed the name of the police from the Kenya Police Force to the Kenya Police Service.

The issue of the election, specifically that of the president who previously could be elected by a minority and govern the country without necessarily forming a coalition government, was also addressed in the new era. The new constitution introduced the 50% +1 vote requirement for a candidate to be declared president-elect in the first round. This is to ensure that the person who holds the office of the president has the mandate of most Kenyan voters. The question of representation remained predominant during the reform

process. The 2010 constitution addressed the issue of women, youths, and persons with disabilities by providing special slots for them in the parliamentary elections. Economic freedom and equality were an important topic during the constitution-making process as people demanded an end to the systematic marginalization from economic benefits due to identity. This saw the restructuring of the government structure by strengthening devolution, which ensures resources are allocated based on a need and population. The Bill of Rights that were previously weak also played an important role in the demand for a new constitution in 2010. Kenyans needed a supreme Bill of Rights that would protect their social, political, and economic freedoms, and the new constitution offered just that. These are some of the reasons that the push for a new constitution is important in Kenya's history and the future of the country's democracy.

Nonetheless, despite promising aspects of the new constitution, serious concerns have been raised with regard to its implementation. Critical bills such as the two-thirds gender representation rule for elective positions have not been implemented 9 years later (Nyadera and Kisaka 2019). There is serious contestation between the central and the local government on revenue allocation; public servants are still engaging in politics, and human rights abuse by security forces are still common. Rampant corruption is also affecting the successful implementation of the constitution as the country continues to lose a huge percentage of its revenue. These factors have sparked a new debate for a new constitution in 2019 that will address some of the gaps left by the 2010 constitution.

## Key Tenets of Democracy in Kenya

Political scientists have over the last two decades or so set out to provide a more comprehensive measurement and conceptualization of democracy (Munck and Verkuilen 2002; Coppedge et al. 2011; Schedler 2001; Treier and Jackman 2008; Beetham 1994). This has increased the scope and quality of democracy. Several indicators are today being used to examine the status of democracy in different countries. These include assessing issues such as elections, freedoms, and separation of power, among others. While pointing out these indicators, some are difficult to measure even among advanced democracies accurately. For example, measuring press freedom or corruption is very difficult not to mention the increasing diversity in different parts of the world and how "outsiders" such as migrants are treated. That said, it is undoubtedly that most African countries are struggling to achieve good scores on these indexes. governance, free and fair elections as well as inclusivity are just but few examples of these challenges. In Kenya, predictable post-election violence has persisted since the return of multiparty politics in the early 1990s. With clear indicators of democracy, the persistent debate as to whether democracy is good for non-western countries or not can be addressed.

Two different arguments can be put forth in this debate for the case of Africa. First, a majority, if not all, African countries have adopted a "western" model system and political structure that seems not to be efficient in the continent. The answer to this may lay deep in the question of whether African democracy should be compared with that of the west. To state our position on this rather complex question, we believe that if African countries are to sufficiently judge if the western political structure is compatible or can efficiently serve the people, then each component of the system, including "western democracy," needs to be implemented. It falls short of any logical conclusion only to borrow the structure (hardware) and not the values (software) that make these structures function. Particularly issues such as freedom, transparency, accountability, meritocracy, and justice remain problematic in many developing countries.

The second argument is that while the debate as to whether Kenya/Africa's democracy can mirror that of western countries remains divisive and controversial, one thing that is not disputable in their comparison is that the challenges faced by governments in Africa are not as severe as they are in the majority of the western countries. Of course, democracy alone cannot explain the

progress in the west and lack of progress in Africa; however, while the governments in the west are able to meet the challenges that may affect their people, in Africa this seems to be an uphill task as the continent fails to meet national, regional, and international goals set to improve economic and political welfare of their citizens. Indeed, it would be simplistic to argue that Kenya and other African countries have not made any progress with regard to the indicators mostly used by scholars of comparative politics to gauge the status of a country's democracy, but more efforts need to be made. Kenya has had a mixed experience in achieving democracy as seen below.

### Right to Vote

The right to vote in Kenya is enshrined in the constitution, and any adult citizen above the age of 18 years has the right to vote in the local, parliamentary, and national elections, with no alarming instance of individuals being denied the right to vote between 1964 and 2017. However, there have been few instances of complaints by some people that the government is delaying providing them with the relevant documents needed to register as voters. There have been instances where some found their names missing on the voter register. Some efforts have been achieved in the last decade, such as the introduction of electronic voter registration as well as the efficient provision of necessary to vote document to every citizen above 18 years.

### Right to Be Elected

In 1964, the ruling party changed the constitution from Westminster parliamentary system to the presidential system; during the process, the opposition party leader (Daniel Moi) was coerced to join the government and given the position of vice president (Widner 1993). The government then banned any opposition political party, thus making it difficult if not impossible for those outside the ruling party (KANU) a chance to be elected. In 1982, the National Assembly, under the influence of the executive, amended the constitution to make Kenya a de facto one-party state denying any other political party the right to participate in elections (Cheesman 2003). In some cases, political leaders were detained without any trial until an election period has passed. After strong local and international pressure, the government was forced to repeal the contentious Section 2A of the Constitution of Kenya in 1992, paving the way for the reintroduction of the plural party system in Kenya. Subsequent general elections saw the participation of different political parties in the elections, but allegations of rigging in 1997, 2007, and 2017 still raise the question of whether participating in an election with predetermined results amount to satisfy this clause.

### Right for Political Leaders to Compete for Support and Votes

The right to compete and seek support from voters in an election is an important practice in a democracy. Indeed, there has not been any direct cases an individual has been denied the right to seek support and votes. Indirectly though, there were cases where political parties were banned, which means it was impossible for leaders to get a political party to use as a vehicle to seek support and votes. The new constitution (2010) gave powers and autonomy to the Registrar of Political Parties, and today there are over 70 registered political parties in Kenya, but they form two dominant coalition political parties (NASA and Jubilee Coalition). The post-2010 constitution has seen an influx in the number of aspirants in various political positions countrywide. This principle is, however, undermined by ethnic-based political parties and voter bribery (Ndegwa 1997; Bratton and Kimenyi 2008).

### Elections that Are Free and Fair

The extent to which a country is able to conduct free and fair elections is an important measure of democracy. Indeed, Kenya has conducted elections periodically after every 5 years. However, these elections were seen as simply procedures to legitimize the leadership of the day. The system of the electoral system had a lot of loopholes, for example, the *Mlolongo* method used in 1988 is a good example of an election that was not conducted freely or fairly (Shilaho 2014; Katumanga 1997). It required voters to stand behind the candidate of their choice, and

headcount was conducted; this scandalous method had a lot of downsides. There were reports of people who had been counted in front running behind to be recounted; in some cases, hot water or bees were thrown on the line with the most people, and as the people ran for their lives, the one with the shortest line was declared the winner. Because there were no cast votes, there was no proof of how many votes were cast for a particular candidate. In 2007 the presidential election was conducted in a messy manner that the chairman of the Electoral Commission of Kenya, Mr. Kivuitu, who announced the disputed presidential results, admitted that he did not know who exactly won the elections. The events saw people who never won the election becoming leaders, and, in both cases, the results of the elections sparked violent protests across the country. In 2013 and 2017, several election petitions were filed by contestants in various courts with a good number of the seats being nullified, including the August 2017 presidential election. The extent to which free and fair elections are conducted remains a contentious issue in Kenya to date.

### Freedom of Association

Between the 1970s and late 1990s, the freedom of association was abused by the government through various state agencies and coercive powers. It is remembered that the Kenya Police Special Branch and the Police force ensured that a gathering of more than three people was not possible. This began after a failed attempted coup in 1982 that was carried out by junior officers of Kenya Air Force. However, since the beginning of the year, 2000, much has been achieved with the 2010 constitution reaffirming the same giving power to associate, membership to trade unions, organizing conventions, and others to the people.

### Freedom of Expression

Reform crusaders in the 1990s were preoccupied with, among other issues, the demand for freedom of expression to be respected in Kenya. Specifically, during the single-party rule, there was little space for one to freely express themselves with the government using various agencies such as the infamous special branch to crack down on government critics. With the repeal of Section 2A and reintroduction of pluralism in the party system, many thought that freedom of expression would have been equally achieved. However, as Kiarie (2004: 55) points out, there was very little achieved as government operations to secretly silence critics continued. Many people ended up in prison and charged with malicious counts that included being members of illegal groups, treason, as well as the illegal use of communication gadgets. Since 2002, this has reduced significantly, with many people being able to express themselves freely and demand more accountability from the government. There are, however, more efforts needed in the long run to secure this freedom.

### Alternative Sources of Information

According to Dahl, people living in society need to have access to alternative sources of information at all times to make informed decisions. Kenya's information sector was characterized by the state-run television network and radio services throughout the 1960s to 1990s. This was used to spread state propaganda and silence any whistleblowers who intended to expose state misdeeds. From 2002, there have been substantial changes partly as a result of amendments in information and communication laws, which allowed the private sector to own broadcasting stations. Also, the spread of social media platforms has opened up a new window for information to spread fast and wide. Sometimes this has been counterproductive, as was seen with the spread of fake news during the 2017 elections in Kenya.

### Institutions of Making Public Policies Should Depend on Votes and Other Expressions of Preference

The importance of having institutions that uphold the interest of the electorate cannot be emphasized enough. It is important that policymakers have the backing of the people at all times. The legislature should be at the center of ensuring laws, and decisions made should reflect the will of the people. While the devolved system of government and the constitution demand that the public be involved through participation in various decision

and policy processes, practically very little has been achieved. Even in instances where some form of participation is witnessed, such as the budget-making process at the county level, these remain but formalities. Similarly, the National Assembly has been on the spotlight for making unpopular decisions in the recent months such as the rejection of contaminated sugar report, the refusal to pass the gender bill, and the decision to award themselves an extra 2500 USD monthly allowances on top of the existing 200, 000 USD mortgage each member is entitled to. This is happening in the background of a biting economic crisis where most citizens can hardly make ends meet.

Indeed, these eight indicators did dominate the entire constitutional reform crusade, and these efforts give birth to a new constitution. With the increasing voices for a constitutional reform process to begin, one would argue that, to some extent, the 2010 constitution did not live up to its full expectations. However, it is important that any efforts to change the law should be geared toward the betterment of the country and its citizens. Below we examine the features of the current political system, which is important in understanding the state of democracy.

## Characteristics of Kenya's Political System

Lijphart (2012, 1989) model has been adopted to conceptualize Kenya's political system and examine how it has evolved over the years.

### Concentration of Power

Over the last 15 years, like other consensus model systems, executive power in Kenya is always concentrated and shared in the hands of pre-election coalition parties that make agreements before an election and submit their Memorandum of Understanding to the registrar of political parties before elections are conducted. This is because of the 42 different ethnic groups, none of them can win the election without the support of others; at the same time, each community has different cleavages (Bates 1983). Therefore, several ethnic groups with their political parties form a coalition to win an election.

### Executive Dominance

Kenya has had two short periods when the head of government was a prime minister (1963–1964 and 2007–2013). The current constitution provides for separation of power between the executive, legislature, and the judiciary. In theory, this means that the three arms of government have equal powers to oversight each other. For example, according to the constitution, the legislature has the power to impeach a sitting president if he violates the constitution. There should be no one arm of government that exercises more powers than the other. However, in practice, the executive, and in particular, the presidency, tends to make it impossible to initiate such a move since members of the parliament need the executive for their political survival. Recently the judiciary has shown some extent of autonomy and independence by making rulings seen as contrary to the executive wishes. It has declared certain laws unconstitutional after the executive used the legislature to pass the bills into law.

### Party System

Political parties are important factors in determining a country's democratic status. The quality of political parties also helps develop some sense of maturity in the manner in which politics is performed. Ideological-based political parties are important vehicles in pushing for issue-based politics that can dilute the influence of ethnicity and other forms of identity. The party system in Kenya from 1964 to 2002 was one-party system where the independence party KANU remained was in power without any other party ever taking over leadership of the country. This has been attributed to the above dictatorial tendencies that ensured opposition parties could not win an election (Nyadera and Agwanda 2019).

Nonetheless, a huge wave of change saw a coalition of opposition parties (NARC) win the 2002 general election becoming the first opposition to lead the government since independence (Anderson 2005). In 2007 general election again lead to a power-sharing deal between the

government and the opposition after a disputed election. The 2013 and 2017 elections were again won by a coalition of parties, most of which were part of the 2002 and 2007 coalition governments. Based on this, we may argue that Kenya is a single-party system.

### Representation

In this case, there is a similarity with the majoritarian model. A winner-takes-all system is in a place where losers of an election are not involved in forming the government, making it a disproportional system (Wrong and Williams 2009). Elections conducted between 1964 and 2007 required a presidential candidate to win a simple majority to form a government. There was no condition to form a coalition government even if the party with the highest number of votes only got 30%. Since 2013, the constitution requires a candidate to at least win a majority of 50% plus one of the votes cast at the national level and also at least 25% of votes in 24 counties (there are 47 counties in Kenya). Equally, smaller parties tend to be absorbed by the dominant ones, thus making a representation of other interests lower.

### Interest Groups

The nature of interest groups can be understood in two dimensions. First, between 1964 and 2002, interest groups, particularly the labor unions, appear to cooperate with the state through negotiations. This argument is, however, problematic given the fact that leadership of interest groups was pretty much influenced by the state, while independent groups were frustrated by state organs. However, after 2002, there has been some extent of plurality where more interest groups can air their concerns without interference from the government. An increased number of local and international civil society organizations are currently operating in the country.

### System of Government

The system of government between 1964 and 2013 was a highly centralized and unitary system of government (Barkan and Chege 1989). This was inefficient and less responsive to the different needs and demands that come with a diverse society like Kenya. This prompted the writers of the 2010 constitution to propose a semi-federal system where the country is to be divided into 47 countries, each headed by a governor and his/her executive and a county assembly. This system was highly supported by members of societies that had been marginalized for years since it gives a clearly defined system of sharing state resources. We call it semi-federal since most of the key functions of the state, as well as decision-making, are maintained at the central government.

### Bicameral Legislature

Although the head of state and government in Kenya is the president and no position for a prime minister, the legislature is a bicameral house divided into the National Assembly and the Senate. The main purpose of the system is to provide a link between the county governments and the central governments. Also, this was done to ensure the representation of minority communities, women, youths, and persons with disabilities. The system has, however, started on a bumpy ride with supremacy battle over which chamber is above the other. There are 47 special seats for women in the National Assembly to ensure that the 2/3 gender rule stipulated by the constitution is achieved.

### Constitutional Rigidity

Kenya has a written constitution inside which basic laws and rules that govern the country are found. After experiencing several amendments to the constitution that led to strengthening the executive and weakening the judiciary and legislature, the new constitution introduces certain defensive mechanisms to protect it from manipulation. Amending the new constitution requires a tedious process that makes it almost impossible to achieve. For example, to change certain clauses of the constitution, one needs to make a draft of the proposed changes and submit it to the Independent Electoral and Boundaries Commission (IEBC), which will then approve the collection of one million signatures to support the amendment. The proposed amendment will then be submitted to all the 47 county assemblies where it will be debated and voted by at least 24 of the county

assemblies. From there, it is forwarded to the National Assembly, where it needs to be passed by a majority before being sent to the Senate for approval, after which a nationwide referendum will be called, and the people will vote for or against the changes. The constitutional court also serves as an arbitrator when two parties dispute over the interpretation of the constitution, making the constitution very rigid.

### Judicial Review

Judicial review is a new concept that was introduced with the passing of the 2010 constitution when the constitutional court and a supreme court were introduced. Today any laws or decisions passed by the executive and/or the legislature will be subject to review by the judiciary. Previously the judiciary had no power to carry out judicial review. For example, an attempt by the executive and legislature to pass the Security Law Amendment Act (SLAA) and its contents were declared unconstitutional after a review by the High Court seating in Nairobi on 23 February 2015.

### Central Bank Independence

In previous years, the Central Bank of Kenya was one of the institutions that faced huge interference from the executive. The president had the power to appoint board members as well as the governor of the central bank. However, after passing the new constitution in 2010, these executive powers have been reduced, and the institution is today enjoying a good level of autonomy. Some of the reforms have seen the appointment of the central bank governor become a competitive affair with the recommended names for this position having to pass through a vetting exercise by the parliamentary Public Accounts Committee before being debated and approved by the whole house and consequent appointment by the president.

## Challenges of Kenya's Democracy

Democracy in Kenya has come a long way since the country attained her independence. However, despite this positive outlook, Kenya has not yet achieved her full potential in the area of democracy, and there is room for improvement. The first step toward this is first to identify the challenges that affect the country's progress in achieving democracy. Some of the challenges have been explained below.

### Ethnicity

Despite the negative effects of ethnicity in Kenyan politics that spills over to affect peace, development, and social cohesion, the country seems to be struggling to deal with this menace (Kisaka and Nyadera 2019). Structurally, Kenya is an amalgamation of large and small ethnic groups, and increasingly the country has been treated to a theory of "tyranny of numbers." Proponents of this idea argue that the larger communities can win an election by simply forming a coalition with another ethnic group without the support of others (Weber 2009: 2). This means that ethnic identity is giving the political elites an avenue to mobilize support among the Kenyan societies and has resulted in the much divisive political process often dividing the country into two major ethnic coalition blocs (Eifert et al. 2010: 495). It is important to note that ethnicity is not only important in winning elections but also shapes decision-making and sharing of the national cake after elections.

Results of the 2013 and other previous general elections can attest to this fact. For example, in 2013, individuals suspected to have masterminded the 2007 post-election violence and were facing trials at the International Criminal Court at the Hauge got overwhelming support from their ethnic groups in the general elections. Even more, interestingly, some governors, members of the parliament, and county assembly members elected in the just concluded 2017 general elections won their respective positions with ease despite being suspected of corruption that led to the loss of billions of taxpayers' money under their watch in their previous positions in the public sector. The third aspect is the role of political elites in the political elites. Since the beginning of multiparty in 1992, leaders have emerged with the guise of being representatives of their communities. Their significance often showcases in matters

politics where they serve as channels of gaining the ultimate political support in their spheres of political influence. Guided by the cardinal rule that political power rests on them, anyone seeking political support from their backyard, they must negotiate with them. These sets of leaders, in many cases, have no national or nationalistic attachment to the nation. Rather their most important agenda is to their ethnic group and mostly, in reality, their ambitions and interests.

The issues that promote negative ethnicity in Kenyan politics cannot be reduced to merely the existence of diverse ethnic groups in the country, but rather it can be viewed through the prism of long-standing legitimate grievances that are not intractable. A committed government focused on eliminating negative ethnicity in Kenya can certainly achieve this goal. Not forgetting that much of the historical political culture of ethnic groups in Kenya was strictly associated with kinship. Pre-colonial African societies were organized and led by tribal leaders and chiefs. This historical culture seems to continue today, all be it in a different setting and approach. Concerns about discrimination and marginalization, electoral transparency, meritocracy, and justice, if solved, can be a huge step toward healing the ethnic divide. The land question is also an emotional issue that needs to be urgently addressed if Kenyans are to get rid of ethnic polarization.

The government has adopted several means to try and foster a shared national identity in Kenya. For example, Swahili and English which are seen as neutral languages became the official languages while cultural and sports events and personalities as well as the education system became the avenues of strengthening national unity. The Constitution of Kenya 2010 guarantees the freedom of movement (Article 39 (1–3)), while the fair distribution of resources (through the devolved system of government) and media such as establishing various vernacular stations are acknowledged. However, more needs to be done, particularly in the implementation of these initiatives, which so far have not helped solve the problem.

## Fake News

Fake news defined as a form of yellow journalism aimed at spreading hoaxes or misinformation deliberately through broadcast media, traditional media, and social media is emerging as one of the most dangerous threats to democratic processes today. Fake news consists of opinions and news that are not true and are intended to mislead the opinion of those who consume it. The emergence of various channels through which people can get information easily and fast provides perpetrators of fake news with an avenue where they can be able to reach many people without the content being certified. The irony of fake news also lies in Article 19 of the Universal Declaration of Human Rights of 1948 that gives individuals freedom of expression and opinion. While this article is fundamental to democracy, it should be emphasized that such freedoms should not be used to manipulate other people's thoughts to mislead them.

In Kenya, fake news has been used in politics for decades but not in the scale witnessed in the 2013 and 2017 general elections. A well-calculated and heavily financed department seems to have been used by parties involved in the presidential elections. A well-orchestrated smear campaign overshadowed the manifesto and promised that candidates were given to the electorate. So competitive was the race for fake news that services of internationally known public relations companies such as Cambridge Analytica, the company now on trial for hacking Facebook user's account and was also behind President Donald Trump election campaign particularly responsible for the leaking of Hilary Clinton's emails, were heavily involved in the Kenyan elections. This was evident on their website portfolio of countries that they had worked in and top CEOs admitting their involvement in the Kenyan election during an undercover media investigation broadcasted widely on mainstream media. To what extent the fake news affected the outcome of elections in Kenya is still difficult to determine; however, the relationship between information and public opinion is very critical and must be preserved at all times.

### Weak Institutions

For democracy to function best, institutions must uphold their responsibilities impartially and without any fear or favor. At the center of this are institutions such as the Ethics and Anti-Corruption Commission (EACC) in Kenya tasked with the responsibility of ensuring that the men and women who occupy public offices comply with Chap. 6 of the Constitution of Kenya 2010 that demand values on leadership and integrity. The Kenya Police and its various departments such as the intelligence service, the investigative arm, the anti-riot units, as well as the regular police have a duty to ensure a fair playing ground for all contestants in an election and protect their rights in campaigning. Media houses also have an important role in playas institutions: they should strive to ensure that fake news or bias coverage of aspirants is discouraged, and professionalism is upheld. The judiciary is central in ensuring grievances of those who feel that the elections were not conducted as per the required standards of the constitution find justice. The most important institution again is the election commission, which needs to conduct itself in the highest level of professionalism efficiently and provide Kenyans with election results that can be verifiable and accurate. Until the 2017 elections, it remains clear that some of these institutions are still weak in executing their mandates, and therefore, there is a strong need to have them strengthened.

## Summary

Kenya's journey toward democracy has come a long way and still has a long way to go. The price the country has paid in terms of loss of life, resources, time, and commitment has been very high. Despite this, it seems there is still more to be done even though the reforms undertaken over the years have started to be felt. Different ethnicities, interests, beliefs, and opinions within the country are becoming more and more represented. Women, minorities, persons with disabilities, and opposition sentiments are being given a platform to be heard. The government is becoming more responsive to the people, and policy-making has started to include actors who were previously marginalized.

It is not by accident that the country has moved to form a "not free" country in the 1990s to a "partly free" country in 2018 according to the Freedom House ratings. It is indeed a recommendable transition given a large number of differing societal cleavages that are found in Kenya. The challenge of serving these interests cannot be stressed enough given the historical, cultural, religious, and socioeconomic backgrounds that come with the differences. For this reason, adopting a mixed model that is purely majoritarian or purely, consensus model seems to be a good decision. The new constitution has become an anchor of the future of Kenya, and the efforts to ensure that its benefits are fully felt should be in place. There is a need to exercise tolerance among the different segments of the society, while the political actors need to show political goodwill in ensuring that the implementation and execution of these new policies are done without sabotage. We will continue to observe the progress of a rather young nation in her quest to climb the democratic ladder. In doing so, we will also try to understand better the merits and demerits of combining elements of a consensus model of democracy with a majoritarian system.

# Execution as Social Policy

James D. Slack
Jackson State University, Jackson, MS, USA

## Synonyms

Capital punishment; Execution; Eye-for-an-eye; Lex talionis

## Definition

Capital punishment: A social policy to take life from someone convicted of the crime of murder. In some settings, the sentence of death may be for lesser crimes or religious crimes.

Condemned: A person convicted of a capital crime.
Death row: A section of a prison that houses the condemned.
Execution: The act of the state taking the life of the condemned.
Just desert argument: Punishment received is punishment deserved.
Last words: The final words spoken by the condemned.
Lex talionis: Retaliation in kind.

E

## Introduction

While capital punishment may seem like a social policy few nations embrace, over 60% of the world's population live in states that recognize capital crimes. Currently 58 nations use capital punishment. Included are "modern" nations, like Japan and the United States; "affluent" nations, such as Saudi Arabia and the United Arab Emirates; Muslim nations, like Iraq and Iran; Christian nations, like the Bahamas and Belarus; small nations, like Barbados and St. Vincent; and large nations, like China and India.

In the United States, capital punishment is an option in 31 (out of 50) states, the federal government, and the US Military. These states are as follows:

| | | |
|---|---|---|
| Alabama | Louisiana | Pennsylvania |
| Arizona | Mississippi | South Carolina |
| Arkansas | Missouri | South Dakota |
| California | Montana | Tennessee |
| Colorado | Nevada | Texas |
| Delaware | New Hampshire | Utah |
| Florida | North Carolina | Virginia |
| Georgia | Ohio | Washington |
| Idaho | Oklahoma | Wyoming |
| Indiana | Oregon | |
| Kansas | | |
| Kentucky | | |

Approximately 3000 inmates are on death row – about 2%, women; 44%, white, 43%, black; and 10%, Hispanic. In general, non-death row inmates in state prisons have a sixth grade education. The average level of education on

death row tends to the second grade. Inmates in federal prison tend to have slightly higher education levels. Because death row inmates in the United States have up to 12 appeals, two of which are mandatory, the average stay on death row is 15 years. However, because the appellate process runs independently for each inmate, with different jurisdictions and judges, it is not uncommon for the condemned to spend 20–30 years waiting for the execution (Death Penalty Information Center).

## Execution as Social Policy

Historically capital punishment in the United States has been regarded as a way to regulate extreme social interaction. That is, the state's act of execution has always been deemed a way to dissuade citizens from murdering others. Because of the Christian faith of the colonialists, it is important to understand the relationship between the Bible and capital punishment. For instance, *Exodus* 21:23–25 speaks of the concept of *lex talionis*: "But if there is serious injury, you are to take life for life, eye for eye, tooth for tooth, hand for hand, foot for foot, burn for burn, wound for wound, bruise for bruise." The Christian New Testament also gives legitimacy for the state's use of capital punishment. In *Romans* 13:1–5, "Let everyone be subject to the governing authorities, for there is no authority except that which God has established. The authorities that exist have been established by God. Consequently, whoever rebels against the authority is rebelling against what God has instituted, and those who do so will bring judgment on themselves. For rulers hold no terror for those who do right, but for those who do wrong. Do you want to be free from fear of the one in authority? Then do what is right and you will be commended. For the one in authority is God's servant for your good. But if you do wrong, be afraid, for rulers do not bear the sword for no reason. They are God's servants, agents of wrath to bring punishment on the wrongdoer. Therefore, it is necessary to submit to the authorities, not only because of possible punishment but also as a matter of conscience."

Christian belief permitted the colonies to embrace the concept of lex talionis. Thomas Jefferson, for instance, authored a crime bill in 1779 in the Virginia colonial legislature that read in part: "Whosoever shall be guilty of Rape, Polygamy, or Sodomy with man or woman shall be punished, if a man, by castration, if a woman, by cutting thro' the cartilage of her nose a hole of one half diameter at the least. . .. . . If any person commit Petty treason, or a husband murder his wife, a parent his child, or a child his parent, he shall suffer death by hanging. . . Whosover committeth murder by poisoning shall suffer death by poison. . . Whosoever committeth murder by way of duel, shall suffer death by hanging; and if he were the challenger, his body, after death, shall be gibbeted. . .. Whosoever shall commit murder in any other way shall suffer death by hanging" (Commonwealth of Virginia 1779).

Hence, since pre-colonial times and in the majority of contemporary states, there is a just desert argument: that someone who murders gets his just desert through execution. Indeed, there are few condemned men on death row in the United States who do not wish they could take back the act of murdering their victims (Slack 2014).

## History and Evolution

Well before the construction of prisons, executions were the way to eliminate a murderer from the community. During colonial times, and throughout most of the nineteenth century, hanging was the preferred method of execution. It was also a source of entertainment not unlike major sporting events of today. Days before the execution, out-of-towners would start to gather. Merchants would take advantage of the event and sell food, drink, and (eventually) souvenirs. The day of the execution would begin in the church where the pastor had prepared a special sermon directed toward the condemned who sat alone in the front pew. The sermon was typically based on lex talionis scriptures, drawing "just desert" lessons for the condemned, as well as deterrent lessons for the public (Masur 1991).

After the church service, the condemned would lead a parade to the hanging tree – that would eventually be replaced by gallows. On the way to the hanging, it was not uncommon for the pastor to encourage the condemned to incorporate key phrases from the sermon into his "last words." The pastor knew that, after the execution, he could sell the sermon, and, if the condemned quoted it, the sermon would bring a higher price. The spectators, as many as triple the population of the community, would line up as close as possible to the gallows – where many had spent the night before to ensure preferred seating. Afterwards, they would scramble for souvenirs – a lace from the shoe that jerked off at the point of the neck snapping or, if lucky, a piece of the noose (Steelwater 2003).

The entertainment value of hangings increased throughout the nineteenth century, and this is why they remained a public spectacle. The science of the process also grew. The length of rope was measured by the weight of the body. Too much length would decapitate the head, while too little length would result in slow strangulation. Manila hemp became the rope of choice, and it was boiled and stretched to limit the "dancing effect" at the drop's end. The knot was lubricated to assure tightness. It was affixed behind the left ear to obtain quicker breakage of the spinal cord. The hands of the condemned were pinioned behind the back, and legs were strapped together to prevent struggling against the drop door. A hood was used to help avoid movement prior to the drop. The condemned is left on the end of the rope for approximately 20 minutes to assure death (See Duff 2001).

While hanging continued to be a method of executions until the mid-twentieth century, other forms of execution became popular ways to implement state death policy. Primarily in the western "cowboy" cultures, states shifted to firing squads. The condemned was escorted into the firing area and seated on a simple chair. With hands and feet tied, he was strapped into the chair. A red heart, pinned to his chest, was the target for the firing squad. There were five members of the firing squad, typically not state employees. Instead hunters were solicited for the team. They were hidden from the view of the condemned, approximately 20 ft away, behind a wall made with aiming slits. One rifle contained a blank to ostensibly give each man on the firing squad the opportunity for plausible deniability – of not being one who shot the condemned in the heart (Steelwater 2003).

Toward the end of the nineteenth century, eastern states began to prefer electrocution. First used in 1890, experimentation was required to make the process of dying as humane as possible. As the twentieth century progressed, the practice took pattern. The condemned was strapped into a wooden, oversized chair made from hardwood trees. The man's legs and arms were strapped into the chair, and a seat belt strapped in his torso. A wet sponge with a metal strap was affixed on the top of the condemned man's clean-shaved head. It was fastened at the chin. A mask was then placed over his head. For about 60 seconds a charge of approximately 2500 volts at 7 amps went through his body. This was repeated. After a 5-minute wait for the body to cool, a physician checked for vital signs. While no longer used by any state, electric chairs remain stored in closets near the death chamber.

In western states, gas chambers were preferred in the twentieth century. The gas chamber was airtight, and most had two or three chairs in them. Underneath each chair was a drop-bucket filled with sulfuric acid and water. Once strapped to the chair, with EKG modules and a long stethoscope attached, hydrogen cyanide pellets were released outside of the chamber and fell into the drop-bucket. The rising fumes caused the body's inability to process oxygen, which resulted in death in about 5 minutes. While no longer in use, five states still have gas chamber facilities – Arizona, California, Mississippi, Missouri, and Wyoming.

First used in Texas in 1982, all death penalty states use lethal injection as the primary means of execution. Procedures and drugs vary by state, but the condemned is typically extracted from a death cell and helped onto the gurney in the death chamber by six to eight members of an execution team. His legs, arms, and torso are strapped down. A healthcare specialist, typically an EMS expert

but never a physician, inserts the needle from the IV tubing into a vein in both arms. (Veins are used because they travel with unoxygenated blood toward the heart, and this quickens the effects of the injection.) Both arms are utilized in case one vein backs up and prevents the flow of the drugs. The temperature is chilled in the death chamber in case the veins in both arms back up, and hence, require a deeper surgical procedure to find a usable vein.

The other end of the IV tubing goes into an adjoining room where the executioner stands. The person selected as the executioner varies by state. In Alabama, by law it is the warden. In Mississippi, the state contracts out those duties. Regardless of whom, the executioner has the ultimate responsibility to plunge the syringe vessels.

Prior to this, as in all types of executions, the condemned is read the death warrant and is given an opportunity for last words. Some use the last words as a desperate means to prolong life, and others are unable to speak. Most condemned persons use those last words for apologies, healing to the victim's loved ones, and messages to their loved ones. The amount of time for last words is relatively brief – lasting for most no more than 1 minute. A chaplain is in the chamber, to comfort as well as to ensure the process speeds along. The chaplain is accompanied by one or two correctional officers who are members of the execution team. Witnesses, representing the state, the victim, and the condemned are watching, and they are usually in separate viewing rooms.

The executioner pushes the first syringe, and that is filled with an anesthetic – 50 cc's of pentobarbital. A second syringe of 50 cc's of pentobarbital is plunged to ensure unconsciousness. (Approximately 7 cc's of pentobarbital is sufficient for surgery in any operating room.) A third syringe, filled with 60 cc's of saline solution, cleans out the tubing and assures all the anesthetic reaches the condemned. At this point, in compliance with the US Supreme Court, a member of the execution team checks for consciousness. This is done by flicking eyelids, pinching cheeks, and trying to get a reaction from hitting the nerve underneath the kneecap. When finished, the execution team member nods to the warden or executioner. At this point the executioner pushes a fourth syringe containing 50 cc's of Pavulon, a muscle relaxant, and this stops the lungs. A fifth syringe brings another 60 cc's of saline solution to clear the IV tubing. Next is the sixth syringe, filled with 60 cc's of a drug to induce heart failure, typically potassium chloride. Finally, a seventh syringe, filled with 60 cc's of saline solution, flushes the IV tubing (Slack 2014).

Witnesses are not aware of the timing of the syringes. Because the condemned quietly goes to sleep, they are never sure the time of death. The fact that the condemned does not feel pain is a concern to some witnesses. However, they know the process is complete when the curtains close in the witness rooms. They are escorted out of the facility, usually with the victim's loved ones leaving first. The victim's loved ones are typically taken to another location for a press conference. The loved ones for the condemned are driving either to their cars or to a motel.

After the curtains close, a physician enters the death chamber, checks for breathing and a pulse, and then pronounces death. Between the sheets and the mattress on the gurney, there is a hidden body bag. Execution team members pull out the edges of the body bag, which engulfs the condemned and all the sheeting, and zip it up. Placing a toe tag onto the zipper of the body bag, the execution team removes the body still on the gurney. In some states, such as Alabama, the body is taken to a hospital for autopsy. In other states, like Mississippi, the body is wheeled out to a funeral hearse for burial. If the body is to be buried on prison grounds, it is just taken to another room.

## Efforts to Curtail Capital Punishment

Since colonial times, groups have tried to curtail capital punishment in various states. An abolitionist movement started before the American Revolutionary War, and it dovetailed with the slave-abolitionist movement prior to the American Civil War. It was not until 1972 that capital punishment was deemed unconstitutional by the US Supreme Court. In Furman v. Georgia (408 U.S.238), the court struck down all state death penalty laws because they tended to be arbitrary and did not match the severity of the

crime to punishment. For instance, some states included kidnapping and rape in the category that warranted execution.

The US Supreme Court revisited the death penalty in the 1976 Gregg v. Georgia (428 U.S. 153) case. Based on *Gregg*, the court now permits the death penalty if the following conditions are met:

1. Trials have to be bifurcated – having a distinct trial phase and a distinct sentencing phase.
2. Juries have the right to proportionality reviews. That is, a jury can request the court to provide similar cases to see the decisions rendered elsewhere are proportional to the decision being considered by the jury.
3. Mitigating factors are permitted to affect punishment decisions.
4. Appellate reviews have to be automatic.

Since *Gregg*, there have been several challenges to lethal injection, most notable are *Glossip v. Gross* and *Baze v. Rees*. Both cases were brought by inmates claiming that lethal injection was cruel and unusual punishment under the US Constitution. Plaintiffs claimed the specific drugs are painful, and unconsciousness is never a certainty. In both cases, the court ruled that insufficient evidence was presented, and that plaintiffs failed to produce an alternative method for execution. As it stands in the United States, the Court has never deemed a particular method of execution as unconstitutional – only the processes leading up to conviction. Hence, more recent attempts by worldwide pharmaceutical companies to block states from purchasing the necessary drugs will most likely cause the states to return to the use of electric chairs.

## Conclusion

There is no agreement on the utility of capital punishment as a social policy tool. Does it curtail murder? There is no causation in that direction, but the murder rate in many non-death penalty states remains high. As a social policy, it is expensive. A county government anywhere in the United States will spend two to three times the amount of taxes on a capital murder case than it would on a non-capital murder case. Capital cases require more investigation and more expert witnesses than other kinds of cases. Yet successful prosecution of non-capital cases creates greater costs to state government operations. Sentenced to life without the possibility of parole, a murderer will cost a state government two to three times the amount it costs to house an inmate on death row. An 18-year-old will most likely be executed by his 40th birthday, hence ending all costs to the state. An 18-year-old with a life sentence may cost the state for the next six or seven decades, with the price of older age vastly surpassing the cost for the inmate incarcerated during the young adult years.

# Executive Accountability in Trinidad and Tobago

Maukesh Basdeo
Department of Political Science, The University of the West Indies – St. Augustine Campus, St. Augustine, Trinidad and Tobago

## Synonyms

Accountability; Committee; Executive accountability; Legislature

## Introduction

Trinidad and Tobago became independent state in 1962 after British rule. Following independence, the new constitutions of Trinidad and Tobago, which was enacted in 1962, implemented a parliamentary system of government. The Trinidad and Tobago (Constitution) (Order in Council 1962) consigned all legislative authority to a bicameral parliament. In 1976, Trinidad and Tobago became a Republic discarding the constitutional monarchy status since independence in 1962.

Under the 1976 republican constitution in Trinidad and Tobago (Laws of Trinidad and Tobago 1976), the president was made a quasi-ceremonial head of state who exercised most of his/her powers on the advice of ministers with limited exception for the personal exercise of powers after consultation or in their own discretion or deliberate judgment. The prime minister and the cabinet are collectively responsible to the legislatures. To ensure executive accountability to the parliament, the constitution makers in Trinidad and Tobago incorporated provisions for parliamentary committee systems, thereby formally granting the parliaments the authority to appoint standing committees as necessary for discharging their functions.

Even though many favorable preconditions of the parliamentary system were provided in the constitution of Trinidad and Tobago, the power of the executive and the majority of the governing party in the parliament hindered the opportunities to balance relations between the executive and the legislature. But it is now widely recognized that one important way of strengthening parliament without weakening the executive is to make maximum use of committees. Committees allow the legislature to simultaneously perform numerous functions that otherwise might not be conducted at all. For example, they help parliament reduce its workload and perform different functions more efficiently.

Up until 1979, most of the parliaments patterned after the Westminster model did not make much use of committees. They historically resisted embracing the new roles of parliamentary committees pioneered elsewhere. In particular, department-related committees that shadow government departments were very often seen as a characteristic of the congressional system, an alien device inappropriate to parliamentary government. Initial attempts to set up department-related committees in different Westminster-type democracies were opposed on the grounds that they would detract attention from the chamber, elevate some members to new positions of influence, and reduce the party struggle to technical matters and coalitional politics.

The requirement of executive accountability can be viewed as a chain where the cabinet, or executive branch, is held collectively responsible and accountable to an elected legislature and must maintain the confidence of the legislature in order to remain in power. Therefore, if the government loses the confidence of the legislature, it must either resign or request a new election. These practices theoretically provide the check on the power of the executive within the system. This essential aspect of the Westminster model is lacking in the Commonwealth Caribbean, and for a long time its parliaments have been unable to perform the key parliamentary task of oversight of the executive.

The parliament, as the legislature is called in the Republic of Trinidad and Tobago, has traditionally made some use of committees. However, in recent years, in particular since the election of the fifth parliament in Trinidad and Tobago 1995, committees have received important, if not widespread, recognition. These are now more visible and much talked about institutions and have a better scope to assert themselves, although the extent to which they can live up to the expectations of their sponsors is yet to be ascertained properly.

This paper seeks to establish that the legislature should be at the apex of a system of executive accountability in Trinidad and Tobago, drawing more effectively on the investigations and the status of its committees and clarifying the role of the legislature in the policy process. It concentrates on the system of committees as the principal vehicle for promoting this culture of scrutiny and improving parliamentary effectiveness.

Therefore, this is a study of the scrutiny of the executive through parliamentary committees.

## A General Framework of Accountability

Accountability can be explained in two ways. First, in a narrow, technical sense, i.e., it refers to the duty of the head of department to account as "an accounting officer" to his or her minister, the auditor general, and last but not least the legislature. Secondly, at a basic textbook level, accountability means "to give an account" of actions or policies or "to account for" spending. A more expansive perspective on accountability requires a person to "explain and justify – against criteria of some kind – their decisions or actions" (Oliver 1994, 246). As a result, the accountability of the executive, bureaucrats, and institutions is one of the central concerns of modern governance.

Robert Pyper has observed that the concept of accountability is often used as a basic benchmark against which systems of government can be judged. This connects to Ayeni's view that an accountable government is deemed to be good government and carries with it connotations of advanced democracy (Ayeni 2000). As a result, the state has a central responsibility in ensuring that accountability is institutionalized and ensure that those who exercise powers in the name of the public fulfill their duties and obligations, and the process by which they are made to answer and account for their actions meets an acceptable standard.

Therefore, accountability can be looked upon as the obligation to account for responsibilities conferred. It is a concept fundamental to any democratic system. It clearly establishes the right of the citizen to know what government intends to achieve on behalf of its citizens and how well it has met its intentions. In the Commonwealth, it means that government is accountable to the parliament for the way in which it manages the power and resources entrusted to it. In turn, the parliament, on behalf of the people, is responsible for ensuring that this accountability takes place (World Conference on Governance 1999, 8–9).

As a result, a clear understanding about using specific aspects and mechanisms of accountability and its linkage to the institutions and actors that will enforce accountability is necessary to operationalize accountability as an agenda of research. Likewise, it is possible to analyze parliaments from many different perspectives. The one that this paper finds more interesting is the role of a parliament in general and its parliamentary committees in particular in ensuring executive accountability.

## The Significance of Parliamentary Committees

The idea of the committee, of which the parliamentary committee is but one example, involves a concept which must be one of the most fundamental and widespread in human societies and organizations. In most cases, the usage of the committee is defined in terms such as "a body of persons appointed or elected for some special business or function" or "a body of persons delegated to consider, investigate, or take action upon and usually to report concerning some matter or business" (Onions 1973, 377).

The first connection to note between committees and parliaments comes directly from the definition illustrated above; a parliament itself may be considered a committee in this case a subset of the electorate. Within Westminster-style parliaments, the most important committee is the cabinet, "a committee of the legislative body selected to be the executive body" (Bagehot 1867, 66). The committee that is the cabinet is an essential feature of the Westminster form of responsible parliamentary government and although not mentioned clearly in the Constitution has been adopted by the Commonwealth Caribbean parliaments ever since their inception, together with many other practices from the British parliament such as standing orders.

The term committee is also used in the parliamentary context to describe any of several types of bodies of parliamentarians established by either (or both) houses but of a numerical size very much smaller than the whole of the chamber. In the

Westminster tradition, this is a practice of long standing: In both Houses of Parliament, the practice of delegating to small bodies of members, regarded as representing the House itself, the consideration of questions, which, as involving points of detail or questions of a technical nature, is unsuited to the House as a whole, is as old as any part of their settled procedure (Erskine May's Treatise 1971, 18th edn, 591).

Over the centuries, parliamentary committees have been established in a variety of ways and for a range of purposes, and it has become convenient and useful to classify them, most commonly in terms of shared characteristics and associated significant attributes. Typical of many such classifications are those of Odgers who noted five types of committees: house of representatives committees, senate committees, joint committees, standing committees, and select committees. On the other hand, Gareth Evans' view was that parliamentary committees, in turn, can perhaps best be understood as existing to perform one or the other of four primary functions: legislative, executive monitoring, investigative and policy initiating, and domestic (Odgers 1976, 468).

The relations among committees tend to differ across countries. However, intrinsically the functions they perform can be quite alike from legislature to legislature. The main tasks of committees are grouped as follows, according to Shaw (Lees and Shaw 1979, 370–377):

1. Legislative function: Committees are expected to deal with legislation. The referral of a bill to a committee means that the committee must give detailed consideration to it and to report it to the plenary.
2. Financial function: It is expected committees will deal with financial matters. In general, the various committees that operate in this area are concerned with the budget and revenue aspects and with the administration of spending programs by the government.
3. Investigative function: Committees are often appointed for the purpose of conducting investigations in connection with legislation or executive oversight.
4. Administrative oversight function: Committees are the most useful instrument of legislatures to oversee the performance of the executive, control the implementation of policies, and call to account the officials of the government.
5. Housekeeping function: Some committees are appointed to fulfill housekeeping activities as, for example, internal rules and procedure, internal administration, and the setting of the agenda.

The proposal to use specialized parliamentary committees of this kind in Trinidad and Tobago was in the air in 1998. So too were considerable debates on the subject especially within the opposition parties. These arguments worked themselves to a standstill, but interest in the subject had revived in 1998, and its importance is such that legislation was introduced, debated, and passed as Act #29 of 1999.

The Constitution (Amendment) Bill, 1998, purports to introduce a new section, 66A, enabling constitutionally established select committees to investigate and report on the powers and methods of functioning of and criteria adopted by service commission, ministries, statutory authorities, and enterprises controlled by or on behalf of the state or in which public monies are invested. The policy contained in this Bill was to provide a legal framework so that the parliament as a whole could scrutinize executive and state administrative action, which can be enjoined and enforced. It did not seek to empower select committees of parliament to come between the decisions of the magistrates' court, the high court, the court of appeal, or the privy council nor did it empower select committees to scrutinize the exercise of judicial power. All it sought to do was to give the parliament the power to scrutinize the exercise of administrative power, that is, the executive and the service commissions exercising powers of administration.

The power and authority of the committees were not to come into force until the relevant standing orders were made to give effect to section 66A. The Standing Orders of the Senate and the House of Representatives were amended on

the 31st and 27th of March 2000, respectively. With the necessary amendments, an institutionalized committee system was present in Trinidad and Tobago to play a central role in holding the executive accountable.

## Assessment of the Committee System Effectiveness

Parliamentary committees in Trinidad and Tobago meet both in camera and in public which is decided on the basis of majority. Officially committees cannot select their chairs and members. Selection and appointment of committee chairs and members are done by the speaker in conference with the whips of the political parties. However, amendments to the standing orders of the house of representatives and senate allow its committees to set their own agenda and send for papers, persons, and documents with the exception that the executive may decline to produce a document on the ground that its disclosure would be prejudicial to national security. The committees can consider legislative bills referred to them and do play a role in budget allocation and demands by means of its finance committee.

In terms of ensuring government accountability, the role of committees is for the most part restricted to the initiation and the recommendation stages with little impact at the implementation level. In Trinidad and Tobago, the departmentally related committees took several years to complete their investigation on a limited number of reports from government ministries, state enterprise, and service commissions. Therefore, at the implementation stage, their role of ensuring executive accountability is hard to judge. It is difficult to determine the percentage of recommendations that were as accepted by the government as against those that were not accepted. For the reason that the majority of government ministers fail to comment on the recommendation within the 90-day period set by the standing orders of the house, there is concern. The committee systems is not highly institutionalized because there is no connection between and among all the stages of committee operations, i.e., committee formation, deliberation, recommendation, and acceptance. The issue of implementation of recommendations is left to the government to act on. This institutional limitation of the committee system in Trinidad and Tobago places the executive in an advantageous position to be the final authority on any matter of governance.

There are many shortcomings in the Trinidad and Tobago parliament. First, the committee system has a restricted role in lawmaking. Second, the low turnover of committee members has not encouraged committee members to develop specialized knowledge and expertise to make committees more effective. Thirdly, despite the fact that the committee system has extensively been expanded over the last 10 years, the coordination mechanism to manage the committees is deficient resulting in a fragmented operation.

Despite the institutional arrangement of a committee system in Trinidad and Tobago, the executive is in a beneficial position to be the ultimate judge on any issue of governance. Officially, the executive is not obliged to implement committee recommendations and is to provide explanatory notes to the parliament. On the whole, this is an institutional limitation of committee systems in a parliamentary system of government because the committees' job is usually done once their recommendations are accepted by the government.

Institutionally, Trinidad and Tobago has a working parliament with a committee system which can generate significant scrutiny in ensuring executive accountability. In terms of ensuring government accountability, the committees are restricted largely to the production of reports and weak at the implementation level. It is apparent from the operations of three selected departmentally related committees that their attempt to ensure executive accountability was mostly limited to the initiation and recommendation stages. At the implementation stage, their role to ensure executive accountability is hard to judge. Overall, committee discussions have for the most part been limited to improving the organization and working of the administrative machinery rather than holding the executive accountable.

Considering the above deficiencies and limitations, the following measures can be taken for strengthening the parliamentary committees in Trinidad and Tobago.

1. The operations of the political parties in Trinidad and Tobago are not democratic to the extent they ought to be. The study showed that committee members were not democratically selected; decisions were mostly taken by the political leader and the chief whip. Legislators relied on their chief whips to straighten out their parliamentary plan. To strengthen the committee system, political parties should stress on political professionalism rather than the personal choice and loyalty in the selection of committee members. For the most part, the political progression of legislators depended primarily on the satisfaction of the political leader relative to their performances in the committee system. Therefore, political parties must be more democratic internally and encourage their members to take part in the committees more seriously.
2. To reinforce the oversight role of the parliamentary committees, it should be compulsory for executive agencies to implement committee decisions, and they should be accountable to the committees for not carrying out the recommendations. To advance parliamentary accountability, the committee reports should be debated and followed up by implementation status reports in the parliament.

In spite of some of the deficiencies, an institutionalized committee system has taken root in the parliament of Trinidad and Tobago. By and large, parliamentary committees have developed their own idiosyncratic identities led by their own institutional values and culture of work. As a result, the current state of securing executive accountability by parliamentary committees in Trinidad and Tobago hinges upon the prevailing overall political context of the country and the institutionalized committee system originating mainly from the political context and shaped in part by the prevailing political culture of Trinidad and Tobago.

## Executive Development

Stephanie Witt[1] and Suzanne McCorkle[2]
[1]School of Public Service, Boise State University, Boise, ID, USA
[2]Boise State University Emeritus, Boise, ID, USA

### Synonyms

Executive competency; Executive development; Executive succession planning; Executive training

### Introduction

To be effective and serve the public well, upper level administrators and executive leaders in the public sector must have knowledge and skill in several areas. It is not enough to merely attain the office, whether through appointment or election, every executive needs to be consciously practicing and improving their leadership and management skills. At the federal level in the United States, the preparation and continuing education needs for leadership-level employees are promoted by the US Office of Personnel Management (OPM). For all levels of government, the accreditation of graduate degrees in public administration and public policy is rigorously enforced by the Network of Schools of Public Policy, Affairs, and Administration (NASPAA). NASPAA has identified key skills and competencies that all of their accredited public administration programs must cover. Taken together, these sets of knowledge, skills, and abilities provide a roadmap for essential skills for executive development.

Most workers can identify specific qualities or attributes that they find important for doing their job. A thoughtful human resource system identifies needed knowledge, skills, and abilities for each job in the organization and designs a training and development system to make sure each employee has the needed competencies to succeed at their job (Fredericksen et al. 2016). While it is common for training and development planning to be done at the middle and lower levels of the organization, it is less common for organizations to have a systematic training program for executive level managers.

In some ways, this is the result of the method used to choose executives in the US governmental system. The top several levels of most public sector agencies are selected on the basis of political appointments. It is not uncommon for presidents, governors, and mayors to choose executives with little to no public sector experience to lead their executive branch agencies. Other executive level positions, for example, the state-level position of Superintendent of Public Instruction, may be chosen by the public through an election. Two factors make creating and maintaining an executive development program challenging. First, turnover and elections make designing and implementing any executive development in a timely way difficult. Second, the broad and leadership-oriented skills needed by executives are less often covered by agency-level training. Unless the president, governor, or mayor has created his or her own executive training, most executives are left out of ongoing development activities.

## Office of Personnel Management

One place where the federal government has developed executive development standards and training is the Office of Personnel Management (OPM). OPM is an independent agency that is the federal equivalent of a Department of Human Resource Management or Department of Personnel. However, OPM tries to do more. It seeks to continue the federal government's reputation as a model employer and seeks to provide guidance to all government agencies. With that mission in mind, OPM (2012) developed the Guide to Senior Executive Service Qualifications which is shown in Tables 1 and 2.

The five core qualifications are operationalized through a listing of competencies (see Table 2), each of which is further defined into specific behaviors through the training programs provided by various government agencies.

Those seeking executive level employment in the federal government must demonstrate these competencies. One can expand on this advice and argue that all candidates for public service leadership positions should develop proficiency in the five core competencies.

## NASPAA

Standards for the preparation of leaders in the public sector are formed by the Network of Schools of Public Policy, Affairs, and Administration, which accredits the relevant degrees at institutions of higher learning worldwide.

NASPAA accreditation standards direct institutions to build degree programs that deliver on the goal of:

> . . . preparing students to be leaders, managers, and analysts in the professions of public affairs, public administration, and public policy and only master's degree programs engaged in educating and training professionals for the aforementioned professions are eligible for accreditation. (NASPAA 2015)

While "leadership" is not as clearly defined as in the OPM standards, programs must provide students several domains of competence (see Table 3).

A study of Masters of Public Administration graduates' use of knowledge and skills provided in the MPA curriculum seemed to confirm the utility of NASPAA standards and found the most used curriculum components of graduates included: written communication, systemic thinking about problems, oral communication, managing heavy workloads, working in groups, data presentation, understanding/managing myself, making decisions with incomplete information, and leadership (Henderson and Chetkovick 2014).

## Other Considerations for Manager Development

A review of the OPM and NASPAA standards for executive skills point to several lessons. First, the

**Executive Development, Table 1** Executive qualifications core competencies

| | |
|---|---|
| **1. Leading change** | This core qualification involves the ability to bring about strategic change, both within and outside the organization, to meet organizational goals. This ECQ requires the ability to establish an organizational vision and to implement it in a continuously changing environment |
| **2. Leading people** | This core qualification involves the ability to lead people toward meeting the organization's vision, mission, and goals. This ECQ requires the ability to provide an inclusive workplace that fosters the development of others, facilitates cooperation and teamwork, and supports constructive resolution of conflicts |
| **3. Results driven** | This core qualification involves the ability to meet organizational goals and customer expectations. This ECQ requires the ability to make decisions that produce high-quality results by applying technical knowledge, analyzing problems, and calculating risks |
| **4. Business acumen** | This core qualification requires the ability to manage human, financial, and information resources strategically |
| **5. Building coalitions** | This core qualification requires the ability to build coalitions internally and with other federal agencies, state and local governments, nonprofit and private sector organizations, foreign governments, or international organizations to achieve common goals (OPM 2012) |

**Executive Development, Table 2** Executive qualifications specific competencies

| | |
|---|---|

**Executive Development, Table 3** NASPAA universal required competencies

| |
|---|
| As the basis for its curriculum, the program will adopt a set of required competencies related to its mission and public service values. The required competencies will include five domains: (1) Leading and managing in public governance; (2) Participating and contributing to the policy process; (3) Analyzing, synthesizing, critically thinking, and solving problems; (4) Making decisions; and (5) Communicating and interacting productively with a diverse and changing public |

effective executive needs to be competent at skills that extend far beyond the technical knowledge related to their particular agency's work. The Director of the Bureau of Land Management, for example, needs far more than technical knowledge about range conservation to run that organization. Second, those expanded skills reflect two important realities about executives in the US system: (1) there is an inevitable interaction with the political system and the public and (2) horizontal skills of coordination, collaboration, and communication are critical in today's networked government involving so many public and nonprofit sector partners (Fredericksen et al. 2016).

There is some evidence that executives may consider their training thus far to be lacking. A survey by the Council for Excellence in Government (CEG) and the US Office of Management and Budget (OMB) of program managers who may or may not have MPA degrees found "35 to 50 percent . . . never received training in areas that appear critical to program management, including dealing with the media, working with stakeholders or Congress, . . . risk management, and budget and financial management" (Razvani and Pick 2008/2009). In addition to ad hoc resources for employee development, specific skills to implement best practices are available in publications prepared for the unique attributes of the public sector; see, for example, McCorkle and Witt (2014). However, there are gaps, and the development of competency standards for program managers similar to the OPM executive standards would be desirable.

## Succession Planning

In addition to promoting personal competence, succession planning – the systematic and ongoing process of developing future leaders – has emerged as a duty of those in executive service. The US Office of Personnel Management (2015) recommends the development of a profile of subordinates and external potential candidates' readiness to assume leadership positions. The depth of the list of ready candidates allows a determination of the level of risk to an agency should the top executive exit the organization. If the agency is at risk, plans can be implemented to develop likely candidates for succession, what has been called filling the pipeline.

Succession planning is required because each agency has some uniqueness – of mission, of workforce, of the nuances of leadership – that may be imperiled if leadership changes precipitously. Also, if succession planning is implemented, institutional knowledge is not lost because the one person who had that knowledge no longer is available.

Recognition of the risks accrued without succession planning has led municipalities, states, and other agencies to develop leadership development programs that fit local needs (see for example, Moffitt 2007; Reeves 2010). For a state-by-state analysis of succession planning challenges and responses during an era of government retrenchment and layoffs, see Fredericksen (2010).

## Conclusion

Although the standards for executive development are extensive, they continue to mature as technological developments emerge and workplace best practices change.

# Executive Orders and Public Administration

Grant Walsh-Haines
Northern Arizona University, Flagstaff, AZ, USA

## Synonyms

Administrative directives; Administrative discretion; Decree; Executive agreement; Executive decision making; Reorganization plans; Signing statements; Unitary executive or unitary executive power or executive unilateralism

## Definition

Executive order: a rule or order issued by the president to an executive branch of the government and having the force of law; a presidential directive that requires or authorizes some action within the executive branch (Mayer 1999).

## Introduction

Presidential power extends to the legislative branch in the American political system, and executive orders are one way for presidents to exert power over the congressional decisions. Presidents use their power to sign executive orders in order to make policy. This is ordinarily the role of congress, given the separation of powers established in Article I, Section I of the US Constitution. Executive orders are considered the most powerful action a president can take because

they involve the most presidential discretion and direct presidential involvement (Fleishman and Aufses 1976). Executive orders, unlike the veto power, which stops legislation, embrace legislation but manipulate the execution of the law. In short, executive orders determine the scope and effect of law: how laws are executed and whom they affect.

Historical examples of executive orders abound. The following lists some well-known examples that had profound consequences and played a significant role in shaping policy in the United States:

- Federal Reserve banks reopened after the stock market crash in 1929 (Roosevelt, Executive Order 6073, March 10, 1933)
- Internment of Japanese-Americans during World War II (Roosevelt, Executive Order 9066, February 19, 1939)
- Desegregation of the Armed Forces (Truman, Executive Order 9981, July 26, 1948)
- The use of cost-benefit analysis in government regulations and spending decisions (Reagan, Executive Order 12291, February 17, 1981).
- Established President's Homeland Security Advisory Council, combined with others increased government access to civilian information (George W. Bush, Executive Order 13260, March 19, 2002)

To put the recent presidential use of executive orders into perspective, Obama (as of this writing) used 231, George W. Bush 291, and Clinton 364. Franklin D. Roosevelt signed 3721 executive orders during his time in office. (For more information, see the database in The American Presidency Project.) As a general historical trend in the United States, presidents issue the greatest number of executive orders during wartime and times of economic crisis. World War I, World War II, and the Great Depression paralleled the greatest number of executive orders. Each of the examples demonstrates the constraints of executive orders to impact government employees or agencies in the executive branch. Presidents can also use executive orders to declare a national state of emergency, which account for the largest number of executive orders (Mayer 1999).

Executive orders commonly begin by describing the constitutional basis for the president's action. Usually, this requires reference for a statute or the Constitution to describe how the president can access his expressed or implied powers to do the task set out by the order. The Supreme Court decision from *Youngstown Co. v. Sawyer* (1952) determined that former president Truman had no constitutional grounding to seize the nation's steel mills during the Korean War. Executive orders are subjected to checks and balances such as judicial review.

Executive orders are one of many presidential powers. For example, an executive order is not the same as an executive agreement or presidential proclamation. An executive agreement is the foreign policy equivalent to an executive order. Executive agreements focus on international diplomacy and treaty making and allow for presidents to make unilateral diplomacy decisions by working directly with another head of government (Fisher 1995). One form of executive agreement is called executive-congressional agreement and requires a simple majority to pass.

Another form of executive agreements, sometimes called sole executive agreements, does not require congressional approval. Unlike treaties, which do require congressional approval, sole executive agreements happen between two heads of government. Presidents opt to use the sole executive agreement when they doubt congressional approval and it does not create new policy. One key difference between executive agreements and executive orders is that executive agreements are not legally binding beyond the terms of the president that enacts the agreement (Krutz and Peake 2009). Therefore, when the next administration takes over, former agreements can be reversed.

An executive order is also not the same as a presidential proclamation. Presidential proclamations do not carry the weight of law and are often crafted in response to congressional decisions. The most notable example, President Lincoln's Emancipation Proclamation, would be better described today as an executive order, not a

proclamation (although Congress did pass the content of the proclamation into law, usually that would occur in the opposite order) (Emancipation Proclamation, January 1 1863). Executive orders are intended to directly affect the administration, meaning all branches and component parts of the executive branch (Grant 2004). This is an important limitation of executive orders, which cannot control judicial or congressional action, for example. As the commander in chief of the executive branch, presidents are well within their purview to tell their cabinet what to do. Executive orders are sometimes said to carry the weight of law, allow for presidents to enact policy, and do not necessarily require support from Congress. How much power does the use of executive order really grant presidents?

## The Shifting Power of the Presidency

More recent trends indicate a withering of congressional effectiveness and power and an increase amount of power held by the president (Buckley 2014). The US Constitution clearly outlines that legislative powers rest with Congress. Recent decades have marked an increase of presidential strategies to sidestep congressional processes and "take the law into their own hands (Newland 2015)." According to some scholars, that is simply unconstitutional because it breeches Article I, Section I of the constitution, which limits legislative power to Congress (ABA n.d.).

The growing power of the presidency is also seen clearly in the president's ability to exercise strategic vetoes. If the president suspects that Congress will overturn his presidential veto, he can adopt another strategy: signing statements. Signing statements occur at the same time the president signs a bill into law. They can be used to praise or criticize a bill, so function as a way for the president to make the law, including additional presidential voice in the process. Presidents Bill Clinton and George W. Bush both used signing statements to declare portions of the laws they signed unconstitutional (Pfiffner 2009). The conversation between the president and congress focuses on whether or not the actions taken by either are constitutional or unconstitutional. Presidents can opt to sign bills into law but then claim that parts of the law are unconstitutional (Woolley 1999).

The constitutionality of signing statements has been called into question. On one side, the Blue-Ribbon Task Force, a subgroup of the American Bar Association, determined that signing statements are unconstitutional because they encourage presidential abuse of separation of powers. The task force claimed that in the case where a president would use a signing statement to describe the unconstitutional nature of a bill, then they ought to veto the bill outright (ABA n.d.; Schwinn 2015). An alternative stance describes the importance for presidents to guide the executive branches actions through the use of executive orders, signing statements, and the veto. These powers enrich the constitutionality of the process by engaging directly with checks and balances (Tribe 2006).

Still another reach of the president into the legislative process is the increasing use of regulatory review (Barilleaux and Kelley 2010). The president can use regulatory review after congress passes a bill into law. Regulatory review occurs when the president orders agencies to follow certain rules related to the laws passed by Congress (Croley 2003). Regulatory review is similar to other forms of growing presidential power to influence the way laws are executed within the agencies of the executive branch.

In sum, the relationship and growing power of the president is tangible in five ways: (1) veto legislation, (2) sign legislation into law and ignore it using signing statements, (3) employ process regulatory review, (4) use executive orders to create laws and, (5) use executive agreements to unilateral diplomatic action. The use of these five strategies to influence the legislative branch are considered administrative discretion or how chief executives in public organization, like CEOs or the president make decisions (Otenyo and Vaughn 2007). Administrative discretion impacts when and how presidents invoke these powers. The role of party and the makeup of Congress also influence administrative discretion.

## Relationship Between Executive Orders and Party Politics

The use of executive orders demonstrates and increases the amount of power in the executive branch. Therefore, Republican presidents are less likely to invoke the power, whereas presidents aligned with the Democratic Party use executives more frequently. Executive orders also occur more frequently when government is divided or when Congress and the president are aligned with opposing parties, democrat and republican. Presidents pass executive orders at higher rates during administrations that experience divided government (Fisher 1995; Mayer 1999).

Often, there is some level of mudslinging when it comes to presidential use of executive orders. Republican congressional leaders accuse democratic presidents, such as former President Clinton and President Obama, of overstepping their powers as head executive through the use of executive orders. The trend, however, has clearly demonstrated that all presidents use the growing power of the presidency to achieve their ends. Data about the number of executive orders shows a general decline in the use of executive orders since former President Truman was in office. Recent presidents have used a comparable number of executive orders (APP n.d.).

## Conclusion

Locating the shifting power of the presidency proves a difficult task. The use of executive orders is merely one way for the president to use the position to exert control over the legislative branch. But there are other reasons to use executive orders, executive agreements, and signing statements, such as a desire to bring an issue into public conversation or bring media awareness to an issue (Chu and Garvey 2014). Context and current events influence how and when presidents use their power.

To summarize, "Presidents use [executive orders] to make substantive policy, exercise emergency powers, strengthen their control over executive branch agencies and administrative processes, emphasize important symbolic stances, and maintain their electoral and governing coalitions" (Mayer 1999). The wide-ranging application of executive orders warrants continued study of their use and implications.

# Exercises in Crisis Management Training

Daniel C. Goodrich[1] and Frances L. Edwards[2]
[1]Mineta Transportation Institute, San Jose, CA, USA
[2]Department of Political Science, Mineta Transportation Institute, San Jose State University, San Jose, CA, USA

## Synonyms

Drills; Maneuvers; Practices

## Definition

"an activity designed to promote emergency preparedness; evaluate emergency operations, policies, plans, procedures, and facilities; train personnel in response duties; and demonstrate operational capability. Exercises consist of performing duties, tasks, or operations in a simulated emergency environment."

## Introduction

Emergency response personnel receive training in how to respond to various types of emergency events. In order to ensure that they have been properly trained, that they have adequate equipment, and that appropriate plans are in place, they practice their response in a simulated environment where an evaluation can be conducted without any threat to life or property. The goal of all exercises is to learn how to improve planning, training, and equipping to achieve the greatest success in a real emergency event. The same skills can be used in planned events, like parades and sporting events.

Exercises can be both passive and active. Participants may practice one skill or using one tool, or they may wear personnel protective equipment and move vehicles. They may sit at a desk and interact with a computer, or they may be one of hundreds of responders at the scene of a simulated event. Each type of exercise has its purpose in evaluating the organization's preparedness for a variety of threats to the agency or community.

## Defining an Exercise

Exercises are opportunities for professionals to practice skills, use plans, and test equipment. Many emergency management-related skills are unique to special or unusual circumstances, like earthquakes or hurricanes, and may become forgotten between events unless there is an exercise designed specifically to use those "seldom-used" skills. An exercise may be focused on one skill – like using a fire extinguisher – or it may attempt to replicate the circumstance in a community during an emergency event. Emergency management exercises are not intended to test individuals, although an exercise may be used as the culminating experience in a training course.

Exercises should be held for a specific reason. Leadership of a department may realize that certain plans and equipment have not been needed for a long period of time. New equipment may have been acquired that needs to be tested against emergency events. Plans may have been revised

and need to be tried in a "fail-safe" environment. Newly elected or appointed senior officials may want to experience the expected response to an emergency event. There may be exercise requirements tied to funding sources like federal grants.

Exercises should be designed to meet specific needs. Once a purpose is defined, a design can begin by selecting the skills, plans, and equipment that should be ready to respond. Only then should a specific scenario be selected to serve as the backdrop for the action, one that would require the use of the skills, plans, and equipment that have been selected.

Exercises are learning opportunities. They must be designed to create a positive environment for testing skills, plans, and equipment, for evaluating the suitability of these items for the event that is forming the backdrop, and to offer an opportunity for an honest critique of what needs to be changed, updated, or replaced to enhance effectiveness of the overall emergency response to this type of event. A regular exercise schedule will enhance preparedness among emergency responders and ensure that community needs will be met when an emergency arises.

Exercises should include everyone who would have to collaborate to protect the community in a real event. In addition to police and fire personnel, the exercise designer must envision what other elements of public agencies, nonprofit agencies, and even business community members (collectively referred to as "whole community") would be needed to ensure that lives are saved, casualties are limited, and that property and the environment are protected. All of these elements should be represented in both the design and the implementation of the exercise. The contribution of the agencies may be as simple as offering some items to be included in the design or as complex as actively using their resources.

## Types of Exercises

The US government recognized the importance of exercises for maintaining emergency response readiness. The Department of Homeland Security (DHS) created the Homeland Security Exercise and Evaluation Program (HSEEP) to ensure that all public safety agencies and all homeland security grant recipients maintained an acceptable level of response capability. They defined two categories of exercises: discussion-based and action-based.

As the name suggests, discussion-based exercises are conducted in a non-threat environment like a classroom, where problems are posed to the participants, and solutions based on existing plans and capabilities are discussed. Participants can hear each other's answers and build a better response through collaboration. Discussion-based exercises are intended to help participants learn more about the plans, skills, and equipment that is available and to work together to enhance the emergency response.

Action-based exercises have a kinesthetic element. The exercise is usually held in an environment that supports interaction with the equipment and employment of the plans and skills through motion. Participants are focused on their own set of skills, plans, and equipment and during the exercise may not be aware of the skills, plans, and equipment being used by all the other participants.

Exercises only achieve their goals if the lessons learned from the event are captured for future application. Formal processes exist to gather the experiences of the participants, evaluate them, and use them to create improvements to the plans, the training cycle, and the equipment cache. By using the different types of exercises in a cycle, an agency can ensure continuous improvement of its response capabilities for the protection of the community from unusual occurrences that may have serious consequences. Comments are collected from the participants and from the exercise director and design staff. In larger exercises, there may also be evaluators, controllers, and observers who provide information collected during an event. This information is gathered into a formal report that is used to determine how best to allocate scarce resources for emergency response improvement. The report's findings can also be used to justify additional external grant support or allocation of local government funds in support of emergency response enhancements.

## Discussion-Based

Discussion-based exercises are divided into four types based on the level of participation by the attendees. In every case there is a learning component that is intended to refresh seldom-used skills. These discussion-based exercises are often used as the beginning of an exercise cycle that will culminate in an action-based exercise.

Sometimes the leaders of the exercise – the exercise director and the designers – are employees of the agency, while at other times they may be outside exercise facilitators from neighboring jurisdictions or consultants. The Federal Emergency Management Agency (FEMA) offers a series of courses to prepare agency personnel to become master exercise practitioners, capable of managing the cycle of exercise planning, implementation, and evaluation.

### Seminar

A seminar is a didactic event with experts giving presentations on emergency response-related issues. Seminars can be used to introduce new plans or the capabilities of new equipment. They can define new skills or the new application of existing skills. Seminars may be given by internal leaders or outside experts.

Seminars focus on one issue. It may be preparing for an action-based exercise. It may be a refresher review of existing skills, plans, and equipment. It can include lessons learned by other agencies that will inform the practice of this agency. The topic may be any issue that supports the development of better emergency response in the community: plans, protocols, procedures, authorities, strategies, or response resources.

Because they are a class-like event, seminars provide an opportunity to give a succinct and coordinated overview of community threats, challenges, and capabilities. The topic can be offered in a specific or comprehensive approach, based on an evaluation of participant knowledge and organizational needs. The drawback to a seminar is that it does not comply with the best practices of adult learning because it is not interactive, generally providing a one-way flow of information. As an introduction to a topic or a refresher for training, a brief seminar can be useful in directing participants' thoughts to the seldom-used skills, plans, and tools, but long-term retention of the information is unlikely, based on adult education research (andragogy). Therefore, seminars should be followed by a more interactive or active exercise.

### Workshop

In a workshop participants are an active part of the event. After a brief introduction, they are assigned specific tasks to accomplish. A report-back period enables all participants to hear what each group did about the assigned tasks. A workshop may be built around plan development or review, around the acquisition of tools and equipment, or around skill selection for future training.

The key to the workshop is that every member of the group participates in the discussion of worthwhile activities, as shown in Fig. 1. Participant interaction is essential, and a product should be developed, such as a draft plan or policy. The outcome or goal must be clearly defined, and the workshop should be based on one specific element or issue.

### Tabletop

A tabletop exercise comes closer to simulating a real event. Each participant has a specific response role, usually based on the participant's emergency responsibility in the agency. A scenario is posed to the group, and in turn each participant describes

**Exercises in Crisis Management Training, Fig. 1** Students in a workshop

what he or his agency would be doing to respond to community needs at that point in the event. Issues are discussed in depth; participants collaboratively examine challenges and develop solutions. A tabletop exercise can be used to examine new plans and lessons learned from other agencies or consider how to integrate new skills and tools into the existing response base.

In a basic tabletop exercise, the scenario is presented to the group at once, and the only evolution occurs through the ideas suggested by the participants. The exercise director allows the event to unfold based on the responses of the participants, and evaluation of their responses is left to the group members until the closing information collection during the "hot wash," a discussion of outcomes at the end of the exercise period.

In an advanced tabletop exercise, the director manages the evolution of the exercise. As participants begin to provide descriptions of their work, the exercise design injects (comments from the exercise director) become more complex, challenging the level of demonstrated knowledge. They may receive prescripted messages of several levels of difficulty. In every case, the proposed response to the situation must be based on an existing plan, skills, tools, and capabilities. When a resolution requires something that is not actually available, the exercise team notes those deficiencies for inclusion in the exercise documentation for future improvements.

The benefit of a tabletop exercise is that everyone at the table learns about the work of all the represented departments and agencies. Often emergency responders have little knowledge of how other departments work. Listening to each representative describe the resources at its command to resolve the emergency triggers new understandings of the collaborations that could occur in the field. For example, at one tabletop exercise, a police representative described the difficulty of knowing whether an active shooter was still inside the building and the dangers of sending officers in to apprehend someone hiding in an unknown location. The fire chief responded that they had infrared cameras that would show the heat signature of a human being in the building. This led to the creation of a new response protocol allowing the police to get fire department support for building searches.

The drawback of a tabletop exercise is that it is very difficult to anticipate the time needed to complete the exercise and achieve the goals. Novice participants may have difficulty sharing relevant information and need significant coaching by the exercise staff. Having copies of the emergency plans and checklists available may be necessary to keep the exercise on track. On the other hand, if the participants are knowledgeable, the exercise may finish quickly. However, participants with extensive experience may have extended information to share that may slow down the unfolding of the event. The exercise director has to gauge the value of the sharing and collaboration versus the value of completing the exercise to control the progress of the scenario.

### Games

A game is a competitive simulation involving two or more teams working to resolve a problem. The rules of the game require the use of plans and protocols during the unfolding event, leading to the integration of all supporting materials in resolving the challenge. The focus is problem solving. Games may be tabletop or computer based. A player may be pitted against another human team or against a computer simulation. Games are useful for validating changes to plans and protocols or evaluating resource requirements. The game can be static, with fixed decision points that earn points for how quickly and completely they are reached, or dynamic, with decision points that evolve with play, driven by each previous decision and its consequences.

Because games are fully interactive, they offer the best learning environment for long-term retention of knowledge, according to andragogy. By creating teams and competition, games engage players more fully and for longer periods. To win they must become familiar with the existing plans and protocols. Computer-based games include elements of fun that keep players engaged for extended periods. The problem with games is that teams may become too competitive and focus on winning rather than actually evaluating and learning. Rather than taking the desired integrated

approach that has all team members developing a comprehensive understanding of the management of an emergency event, teams may divide into specialist activities so that they achieve speed based on individual specialized knowledge. The desire to win versus the need to learn has to be balanced by the exercise controllers, but slowing down a team can create morale problems in a highly competitive environment.

## Action-Based

The second category of exercises is action-based. In these exercises the participants engage in a kinesthetic element, which will vary from using desktop resources to field level equipment and facility activity. The goal of action-based exercises is to create "muscle memory" of how things are done, so that when the skill or equipment is needed its proper application is automatic.

Adults remember what they do longer and more completely than what they are told. Therefore, it is crucial to have exercise staff members available to immediately stop and correct errors, so that only the right actions are remembered. For example, during a full-scale exercise, a fire company was allowed to enter a contaminated building without the protective respirators. Initially no one wanted to stop them because they did not want to embarrass them. The exercise director insisted on giving them "dead" cards when they emerged from the building to emphasize to them and the rest of the participants that respiratory protection must be used until the area is cleared by the safety officer.

### Drill

A drill is an active exercise that is focused on one activity. A fire drill is an example, where everyone leaves the building using the designated fire escape routes. They are used to provide training on new equipment, validate procedures or practice, and maintain current skills, as shown in Fig. 2. Because of the single-skill focus, there is usually not a scenario provided.

Drills provide an opportunity to refresh skills on seldom-used equipment or to provide additional time interacting with other professional partners. For example, in an evacuation drill the participants exit and report to their supervisors, but they may also interact with the American Red Cross chapter that has set up a rehabilitation tent for the participants.

**Exercises in Crisis Management Training, Fig. 2** Fire extinguisher drill

The benefit of a drill is that the individual participant will only have to commit limited time to participation in a single-skill scenario. The event offers the kinesthetic experience of handling and properly using the equipment, enhancing long-term recall of the skill set. However, the skill set exists within an implementation plan, and it is easy in the rush to handle the equipment to overlook the larger context of skills, plans, and procedures. This can be overcome through a complete introduction before the practical skill section begins.

### Functional

A functional exercise is developed to evaluate capabilities, multiple functions, and interdependent functions. It uses a realistic exercise scenario that describes a likely community emergency event that would require a response. The exercise is based on existing plans, policies, and procedures that guide the response. Participants operate in the real-world response environment, such as a field command post or an emergency operations center, but there is no external activity. The rest of the event is simulated through message traffic using the actual protocols and equipment that would be available in an emergency.

Participants receive scenario intelligence through a simulation cell (sim cell) that

communicates a common operating picture through radio, telephone, computer, Wi-Fi, social media, or other channels that are preestablished for emergency response information sharing. They take simulated actions and communicate them back to the sim cell using the planned communications channels. Thus the functions are practiced without moving people or equipment.

Functional exercises demonstrate the interactions of players across departments and agencies. They test channels of communication for their adequacy and ease of use. For example, if an emergency communications vehicle is included in the functional exercise, the operators determine how easy it is to raise the antenna mast and establish a clear radio signal. The drawback to a functional exercise is that many real-world deficiencies cannot be recognized in the limited environment of a functional exercise. The prescripted messages are designed to be handled according to plan, which may give a false sense of security to operators in an emergency environment, with more infrastructure failures and inadequate staffing of critical positions due to travel limitations. For example, a community may have a successful hurricane functional exercise using trained city staff and Radio Amateurs in Civil Emergency Services (RACES) volunteers, but when the hurricane strikes, the RACES members may be trapped at work and unable to provide the communications support that was successful in the functional exercise.

### Traditional Full-Scale Exercise

A traditional full-scale exercise is like a play. It is prescripted based on existing plans, skills, and equipment, using a realistic scenario from the list of community threats. The Master Sequence of Events List (MSEL) is a timed list of actions that would be triggered by the unfolding event. Not every action can be anticipated because some aspects of the response may be created by knowledgeable participants with resources that the MSEL creators did not think of. For example, during a hazardous material exposure scenario exercise, a fire truck crew was dispatched to decontaminate a patient in an area without a working water system due to disaster damage. The MSEL writers anticipated that they would have to disrobe the patient and use baby wipes on his exposed skin. Instead, they knew that they carried a water fire extinguisher and used that to clean the victim's hair, hands, and face. This was creative and appropriate, but outside the MSEL. Such spontaneous improvisation is encouraged and documented in the exercise reports.

Traditional full-scale exercises are used primarily to reassure the community and the elected officials of the emergency response capability of the community. They require many hours to perform to really test policies, plans, and equipment. Dozens to hundreds of agency staff are taken from their regular duties to engage in the exercise, and victims have to be recruited from the community or volunteer organizations. The event is costly in both manpower and resource consumption, as disposable equipment and consumable supplies must be used for realistic response practice. It provides the opportunity for plans, skills, and equipment to be used in a close-to-real environment where lack of coordination or unrealistic plans will become apparent. The drawback – in addition to the cost – is that to keep the exercise on target, it has to be extensively scripted. As a result, many real-world challenges are solved in the exercise planning process to keep the play moving forward. For example, police and fire vehicles are pre-positioned adjacent to the exercise location to avoid the liability of code-3 driving through the community. This, however, prevents testing whether the anticipated travel paths would be traversed in the time estimated at the time of day of the exercise. This can create unrealistic expectations for how quickly and in what quantity help would arrive in a real event.

Full-scale exercises are poor adult learning environments. Most exercises have a cold start, meaning that people are called from duty to participate without any briefing, as they would be in a real event. While this adds to the realism, it does not ensure that people will follow the existing plans. Since these are seldom-used skills, it is likely that people will not remember how to use equipment or apply a skill, but the full-scale environment provides few clues for participants who are performing incorrectly. The exercise

evaluators will note the errors, but the players will have proceeded incorrectly, meaning that they are more likely to remember the wrong thing that they did, rather than the corrected action told to them at the exercise evaluation at the end of the day. There also tends to be an element of competition among the players, with each department wanting to be "better" than the others, so the level of caution that would be used in a real life-threatening event is unlikely to be seen in a full-scale exercise. This competition can also lead to the compromising of the MSEL due to the departmental representation involved in its design. MSEL designers may feel obligated to share the scenario and expectations with their daily co-workers to insure their success. This undermines the nature of a full scale which is supposed to be a "solve all problems" situation for participants.

### Facilitated Exercise

In an effort to overcome the drawbacks of the traditional full-scale exercise, one city created a modified model that benefits from the kinesthetic elements of a full-scale exercise while preventing the incorrect operations often found during the traditional full-scale exercise. It is called a "facilitated exercise" because the play is organized by learning stations with facilitators. The players are divided into groups of 25 or fewer people and rotate through the learning stations during their time at the exercise. The first learning station's facilitator lays out the scenario and invites the participants to describe their reactions and immediate responses, including creating an initial incident action plan (IAP). The facilitator guides the discussion to ensure that incorrect suggestions are not used and that only correct actions are included in the IAP.

The next station simulates the first elements of the emergency scene and focuses on operations, having the players describe how they would implement the initial IAP, including what equipment they would use, where they would stage vehicles, and what safety plan they would make. The facilitator guides their discussion and provides references back to plans and procedures. He will remind the players of available resources and suggest items for use in resolving the scenario that the players may have overlooked. Before they operationalize the response, the plan has been developed according to the safety plan and the department protocols.

The third and fourth learning stations each focus on one seldom-used skill. One may be dealing with bombs and improvised explosive devices (identify, isolate, call for the bomb squad), while another may be explaining the use of newly acquired medical assets like blood coagulant. In every case before any action is taken, the facilitator guides the group discussion to ensure that all actions are within plan and protocol.

The last learning station combines rehabilitation (a fire service term for providing a place to cool off and drink water) and a psychological debriefing, just as would be conducted at a real event. The department psychologist and other volunteer counselors conduct the debriefing to help participants deal with any stress from the exercise and also to prepare for the stress of a real event.

The facilitated exercise has the same positive aspects as the traditional full-scale exercise, in that it allows adult learners to physically interact with their equipment and move according to the safety plan and IAP. In addition, it ensures that all actions are according to department plans and protocols, while allowing for a discussion of areas in the plans that may need improvement. The drawback to a facilitated exercise is that it does not permit participants to make mistakes, so while they can propose incorrect suggestions, they will only be allowed to act on correct interpretations of their training. It can be argued that by preventing the players from finding their own way out of problems unassisted, some of the benefits of a full-scale exercise are lost.

## Matching Exercise Goals and Scenarios

Some exercise developers are tempted to start with a scenario and then decide how to structure the goals and objectives for the exercise. This leads to confusion and disappointment for the

participants, as the scenario may be too difficult to manage or the required activities to resolve the chosen issue may not meet the stated exercise goals. For example, it is common to have senior level officials demand a tornado exercise and then set goals of testing communication equipment and mutual aid. In a tornado the communication systems are usually the first losses, as cell towers and radio repeaters are destroyed by the wind. The amount of debris created by a tornado will often prevent the arrival of mutual aid for hours to days. Unless there is an acceleration aspect to the exercise time schedule, the players will arrive at shift change before any action occurs.

### Developing Exercise Goals

The agencies developing the exercise should start by understanding the motivation for the exercise. Are there grant requirements for holding the exercise and using specific equipment? Has a new threat to the community been recognized? Is there a new or revised plan that needs to be tested? Is there new equipment that needs to be integrated into the existing plans? Do elected officials want reassurance that the community response plan works?

Once the motivation for the exercise has been understood, the appropriate type of exercise can be selected and goals can be established. A new threat might be the basis for a workshop to develop new response protocols, and the goals would be related to developing new elements to the plan and listing new equipment that would be needed or additional study that would be beneficial. A concerned elected official might benefit from participating in a tabletop exercise where he could hear each department explain its role and response, and the goals would be to use the response plan, describe existing skills among employees, and determine the adequacy of the current emergency communication systems. A grant requirement might mandate a full-scale exercise to test the integration of training and equipment paid for with the grant funds, so the goals would be driven by the grant requirements for demonstrating capability. In each case the exercise goals would be supported by the type of exercise selected.

### Developing Scenarios to Achieve Goals

Once the specific goals and the exercise type have been established, the exercise committee can select an appropriate threat to the community that would allow players to meet their goals but be manageable with existing resources. Catastrophic events are difficult or impossible to manage in the best of circumstances, so keeping the scale of the event to something likely and realistic is important. Often a good strategy is to replicate a real event that occurred in that community or nearby and demonstrate the changes and improvements since the event. Do not select threats that doom the exercise to failure.

## Exercise Outcomes in Emergency Management

Exercises enable first responders and emergency managers to bring all elements of the "whole community" together to plan for and execute the exercise. There are a number of probable outcomes that should be anticipated. The desired outcomes may also drive exercise goals and scenarios.

The outcome of most exercises is an evaluation of current conditions and a list of improvements that may be desirable. The first element that will be tested in all exercises is the plan. Did the existing emergency response plan support the challenges faced by the responders? Were the checklists adequate to guide good decision-making in a high-stress environment? If not, how could these plans be improved? Were the available facilities and equipment adequate to support the response? What was missing, out of date, poorly maintained, or inadequate for current conditions? Are there training needs demonstrated by the response? Are there qualifications and certifications that would have enhanced the response or provided the opportunity to use better equipment? Are there newer techniques for managing the response that could be adopted, such as more layers in a GIS map?

Reaction to the exercise by the elected officials and the community is crucial. It is important to ensure that the local media have access to watch the event unfold in the company of a

knowledgeable staff member who can explain what they are seeing. Photo opportunities for visual media are important, as their broadcasts will influence community perception of the event. A debriefing should be held for any elected official observer to ensure that their questions and concerns are addressed immediately and to get their support for remedying deficiencies revealed in the exercise.

## Learning from Exercises

Exercises are expensive and time-consuming, so it is important to document the event and the outcomes thoroughly to improve emergency response. Three steps provide for information collection to ensure adequate documentation.

### Hot Wash

Immediately after an exercise, everyone who participated should have a chance to comment on his experience, from the most senior person present to the volunteer, while the events are fresh. Each player has a different perspective based on his profession, location in the exercise, and assigned task. The players may be more sensitive to the unfolding of the exercise than the evaluators and observers. There are players everywhere, while the exercise staff are only each in one place at a time.

The most effective way to collect responses from all players is to distribute refreshments and surveys at the end of the event. People will come for the cookies and cold drinks and be more likely to complete the survey and leave it in the refreshment facility. The anonymous surveys can have just a few questions focused on the exercise goals, and then an evaluation of whether the player thought the exercise improved his ability to do his job. This information will contribute to a better understanding of the exercise outcomes.

### After Action Review

The After Action Review is a formal meeting of the leadership of the exercise, the planning team, and the representatives of every department and organization that participated. There should be a formal agenda that addresses the achievement of the specific goals of the exercise. Each participant should contribute information on his department's participation in the exercise, statistics on the number of personnel in each job category, financial information on costs to his department for personnel time and overtime, and equipment and supplies that were consumed or destroyed. This is crucial in both reimbursing partners where possible, and on budgeting for future exercises, especially when grant funding is available. Each department representative should address the agenda issues, explaining how his department contributed to achieving the goals and noting any deficiencies in the emergency response plan, the level of training, the amount of equipment, or the support facilities. This information becomes part of the exercise documentation.

### After Action Report and Improvement Matrix

After all the comments have been assembled, a formal report of the exercise conduct and outcomes is created. The After Action Report normally includes the following sections: executive summary, exercise overview, exercise goals and objectives, exercise events synopsis, analysis of mission outcomes, and the analysis of critical task performance. The exercise evaluation guide that was provided to the evaluators is attached, with their consensus comments included.

The outcome of the evaluation is the Improvement Matrix. The purpose of the exercise was to achieve a set of goals, allowing the organization to analyze its readiness and response capabilities. The outcomes will lead to an understanding of deficiencies in performance, training, equipment, and facilities. These are documented in the Improvement Matrix for use in applying for emergency response improvement grants or agency budgetary allocations. The matrix has the following columns: the core capability tested, the task or station where it was tested, the recommendation, the action that must be taken to fulfill the recommendation, the capability element where the deficiency was found, the agency responsible to address the deficiency, the date that the improvement will be started, and the date that it is expected to be resolved. This information provides a path forward to process improvement and program development for emergency response services in the community.

## Conclusion

Exercises are an important method for testing a community's level of emergency preparedness. Exercises enable the testing of plans, training, and equipment used by the first responders in support of various levels of response to known threats. A regular check of these capabilities and a systematic plan for improving them are essential to ensure community safety during an emergency event.

## Synonyms

Resilience as a policy goal; Resilience as an adaptation mechanism; Risk management implementation in public institutions; Strategically agile government

## Definitions

From a public policy perspective, resilience can be defined in a twofold manner. First, it refers to an adaptation mechanism associated with societal complexity. The nature, dynamics, and functions of this adaptation mechanism build upon government structures and the traditions of the given administrative–political system in the country in question. As far as the institutions and organizations in the public domain are concerned the components of resilience can be understood as properties, abilities, or capabilities. In practice, resilience as an adaptation mechanism requires strategic sensitivity, resource fluidity, and collective commitment among political decision-makers and government officials, particularly top civil servants. Second, resilience can be conceived of as a policy or organizational goal in public-sector management. Approached from this perspective, resilience connects strongly with foresight dynamics and is an intentional act under the umbrella of a policy agenda aiming to strengthen the governing system's capacity to absorb and adjust to change by making plans for adaptation, delivery mechanisms, and by learning various protocols from it.

## Introduction

### Approach of the Entry

This entry explores the following questions: Why are some public institutions capable of coping with endogenous and exogenous shocks thus maintaining their performance and the ability to renew themselves even in disruptive circumstances? How is it that some public institutions rather than others are capable of tackling these challenges and how do they do it? Is resilience – as understood and conceived in a governmental context – a policy goal or an organizational mechanism, or both? And finally, how has Finland succeeded in these COVID19 times in maintaining and strengthening its public administration resilience capacity?

Before describing the components of societal complexity and organizational/

institutional resilience, a brief explanation of the fundaments of society is required. Resilience as an adaptation mechanism relating to societal complexity takes its form in a sphere constituted by the economy and the government which are, by nature, coevolving complex systems that are separate from each other, but which cannot be considered or problematized separately (e.g., Colander and Kupers 2014: 181–183).

At the outset, the nature of *organizational and institutional resilience* is not easy to define. The components of resilience can be understood as properties, abilities, or capabilities, from the perspective from where resilience is thought and practiced (e.g., Ruiz-Martin et al. 2018). Thus, the theories of organizational resilience focus on various aspects of organizational functions. Stemming originally from crisis and disaster management, Tengblad (2018), for instance, advocates the view that organizational resilience theories approach organizations by using concepts such as variation, selection, and retention, to render transparent the mechanisms used by public, private, and nongovernmental organizations, to adapt to emergent societal or organizational challenges while enhancing their change capacity.

One common feature in resilience theories is the idea that society is conceived as complex, orchestrated, and embedded by systemic institutions, networks, and events. From the organizations' point of view, the key issue is then the capability to address and to highlight the centrality of unforeseen events and unanticipated consequences, be those negative or positive and this capability is crucial in terms of how adaptation succeeds. Kantur and Iseri-Say (2012) label this capacity feature as an organization's "evolvability."

Public administrations throughout the world embody several key characteristics. One of these is the societal stability function. This entry tackles this question by asking how the question of stability is addressed in terms of institutional and organizational resilience – i.e., how resilience matters in institutional and organizational terms when the operational environment of the public administration concerned becomes progressively more turbulent – and, specifically, how this has developed in relation to the Finnish system of public organizations.

Bouckaert and Jann (2020: 30–31) have aptly reminded us that public administration leaders and academics should not only keep their eyes on their feet – i.e., the present situation – but also on the future and ask themselves how should we deal with the future and problematize how they can learn to trust utopias and distrust dystopias, thinking beyond short-term problems and solutions while trying to be as realistic as possible at the same time.The issue of reinventing, recalibrating, or rethinking the role of government/public administration is not a novel topic (e.g., Frederickson 1996; Waldo 1968, 1971), but over the years (and especially towards the end of 2010s), this discussion has shifted away from discussions related to what public administration's role is in society towards more nuanced debates about how governments and public institutions in general tackle enduring ambiguity and uncertainty in their operational systems and strategic environments (e.g., Ansell et al. 2017). One of the reasons for this changing discourse relates to the proliferation of the concept of VUCA, originally forwarded by the military during the early Cold War (referring to the change of environment defined by the conceptual dimensions of volatility, uncertainty, complexity, and ambiguity).

## The Structure of the Entry

The structure of the entry will progress as follows. First, the key concepts (and the subconcepts related to them) of this entry are defined, namely societal complexity and organizational resilience. Second, this entry looks at the context surrounding government resilience and makes a distinction between government functions (stability, trust and continuity, and renewal as ideal types) based, in part, on the legal and in particular the constitutional framework for public administration and how these ideal types relate to the motivation and principles around strengthening resilience capacity in government and across the institutions and organizations in the public sector more generally. Furthermore, this entry explains, in brief, the VUCA approach to describing changes in the operational environment as well as the nature of

external and internal shocks. The role of internal shocks (or resilience change drivers) causing the need to strengthen resilience capacity is, we suggest, often neglected in research in this field, but it is essential from the perspective of public administration. Thirdly, this entry presents a typology of adaptation mechanisms (as parts of resilience strategies) within a governmental context emphasizing the role of leadership and management in two dimensions – both at the level of political decision-making and at that of top civil service and adequate management processes (e.g., through strategic human resource management). Fourthly, this entry will present a case study on how the Finnish government and public administration institutions and organizations have implemented resilience strategies during the 2020 COVID19 pandemic. Finally, this entry concludes with a discussion of the main ideas presented and discussed as well as forwarding ideas for further scrutiny and analysis.

## Conceptual Frame

### Societal Complexity

This entry builds upon the idea that societal complexity presents a fundamental challenge to organizational resilience in an age of rapid change in the operating environment of public institutions. The controllability of society as a complex evolving system is a relevant question: for government to be resilient in a complex society no longer – if it ever did – implies that government or some other institution controls society. According to Colander and Kupers (2014: 5–6), for instance, government is just "one component of those endogenously evolved control mechanisms."

If societal complexity is the answer, one of proceeding questions relates to resilience mechanisms. There is no scarcity of definitions of how to define societal complexity.The dynamic role of societal complexity – i.e., viewed as wicked problems from the perspective of public policies and government – constitute new ground for adaptation mechanisms in public institutions and, in practice, mean that turbulent times are no longer periodical but immanent. One peculiar issue here is that societal complexity often appears in these definitions alongside the topic of pervasive societal problems that cannot be easily addressed within the contextual framework of single public policies. Understood from this perspective, policymakers within political–administrative systems are often unable to deal with these problems without a broader, comprehensive, understanding of the interconnectedness of public policies.

Societal complexity incorporates a number of other definitions providing content to complexity. These include *emergence* (referring to the existence of new, unexpected structures, patterns, or processes), *diversity* (referring to the state of existing, different in comparison to the mainstream), *adaptability* (referring to the capacity to change system because of external or internal pressure), *self-steering/self-organizing* (referring to the process that the system adopts without any direct central authority), *interconnectedness* (referring to relational/reciprocal contacts between system actors), *nonlinearity* (referring to nontransparent or implicit connections between the phases of system vis-á-vis initial understanding and conditions), *dissipative structures* (referring to the breaking of symmetry and the existence of multiple choices), and *path dependency* (referring to chains of events that are dependent on the sequence of previous events that have taken place in the course of time) (Cilliers 1998).

Complex society requires complex problem-solving, systems thinking, and organizational adaptivity among policy planners, decisions-makers, and public sector managers and leaders. To gain insight into the nature of the interconnectedness of phenomena in a complex society, policy planners and organizational leadership in public institutions and organizations need new kinds of tools that can be supplied from the domains of complexity science – e.g., fractal analysis, evolutionary game theory, and nonlinear dynamic analysis methods, as well as agent- and agency-based models of reasoning (e.g., Colander and Kupers 2014: 57–59). Societal complexity can also be approached from the perspective of metacognition – as an understanding of how we think and how we think others are thinking – and thus as a set of epistemological crises reflected

from the point of view of the philosophy of science as argued for instance by MacIntyre (1977; "consider what it is to share a culture."). Overall, as Stacey (2010) points out, societal complexity brings about the need to understand organizations –private, public, nongovernmental – and public policies as well as complex responsive processes and the people engaged with these organizations are active through various communicative and dialogical actions and links with other organizations.

### Organizational Resilience

Further, societal resilience can be defined as "a neighbourhood's capacity to weather crises such as disasters and engage in effective and efficient recovery through coordinated efforts and cooperative activities" (Aldrich 2012: 7). Resilience is thus more or less synonymous with "recovery," or the extent to which a community is able to "bounce back" after being hit by a disturbance. Further, organizational resilience builds upon, by definition, organizational context. It refers to how organizations are able to secure and maintain their continuity and performance when they adapt to internal and external shocks through different kinds of change processes and change capacity (e.g., Stacey 2010).

Moreover, in the business sector, resilience also connects, first, with the ability to understand changes in how clients and customers act and behave and secondly, with the foresight and implementation capability to focus on the problems their customers try to solve and then to configure their offerings to address these problems (e.g., Gulati 2009; Senge 1990). From a risk management perspective, resilient organizations are better equipped for business continuity in a rapidly changing context. The concept of organizational resilience can be approached and explained from the perspectives of various academic fields including psychology, sociology, ecology, organization theory, public administration, and political science. Despite the diversity of academic disciplines, Vickers and Kouzmin (2001), for instance, have criticized "traditional ways" of approaching organizational resilience due to the fact that they forget human beings, how people feel about the pressures that organizations face, how people adapt, and with what kind of strategies, to enhance the continuity of their life courses.

Finally, organizational resilience within public policies, public institutions, and public administration lie at the heart of the UN's sustainable development goal 16 which promotes functioning high-capacity institutions for an inclusive society to provide access to justice for all and to build effective, accountable, and inclusive institutions at all levels.

E

## The Changing Context for Government Resilience

### Government's Multifaceted Functions and Roles

Traditionally, the institutions of public administration have gained their societal legitimacy by maintaining stability, trust, and stability through the creation, for instance, of democratic systems and institutions, serving the electorate and political decision-makers and the creation of publicly delivered and/or funded services – both in times of turbulence and as a means to support peaceful societal development. During the last decade, however, discussions among policymakers and academics around a more expansive role for government have proliferated.

This turn is important from the perspective of societal resilience since it can – in itself – be considered an act of resilience. This turn has been immense when we bear in mind the extremely powerful narrative of the 1980s and 1990s that government should limit itself to market correction. From this perspective, governments not only facilitate policies and public service delivery and redistribute value, collected through taxation and by various redistribution mechanisms such as welfare benefits and social and health-care services, but also create value by taking part in innovation policies and renewing public institutions and policies to better meet the challenges societies face. In terms of innovation policies, for instance, governments have taken a more active role in busting new initiatives and

achieving new steps in market building through diverse policy instrument selections (e.g., Mazzucato 2018; Virtanen and Tammeaid 2020).

Overall, it is not only government that has gained new roles in society. The change has also impacted civil society. Recent financial crises (especially the great financial recession of 2008) and the COVID19 pandemic have underlined the evolving role of civil society more generally. Mulgan (2013: 45–46), for instance, has argued that governments step in when markets fail: when money disappears and the economy is in turmoil, people turn to their families and to their communities.

Overall, it is important to clearly distinguish between the government responses in 2008 and 2020. In the first instance (economic recession that took place), governments introduced market-saving (not correcting) mechanisms by, for instance, bailing out the banks which was followed by economic hardships and austerity policies for many years, whereas in the latter case there has been more expansive response to the impact of COVID19 pandemic (for instance, employment support and support for businesses).

The aforementioned evolution of government functions has brought about the need to rethink the role of governmental and societal resilience. These spheres of resilience interconnect with each other. But while on the governmental side resilience takes place two-dimensionally, either as an adaptation mechanism and public policy goal, at the societal level resilience reflects how children and families cope with disruptive shocks and major difficulties in their lives. Bourgon (2017) has made an important point here by underling the idea that these forms of resilience – governmental and societal – should always be considered simultaneously and in relation to each other and this is important especially in the case of public sector reforms. According to Bourgon (ibid.), public sector reforms should always have a dimension which would deal with the everyday aspects of people and living communities.

## Changing Operational Environment

A plethora of research literature exists on public administration's changing approach to strategy and strategic thought. One key takeaway from this strand of academic discussion is the concept of VUCA which stands for volatility, uncertainty, complexity, and ambiguity (e.g., Mack et al. 2016). The VUCA dimensions capture the essence of societal change around government operation and the democratic institutions in society. Concerning the VUCA acronym, volatility refers to turbulence, a phenomenon that is occurring more frequently than in the past. Uncertainty, then, stands for the lack of predictability in issues and events that emerge. Complexity makes explicit the numerous, difficult-to-understand, interconnected causes and mitigating factors involved in, for instance, a wicked societal problem or challenge (e.g., social exclusion, climate change, digital crime, obesity in young people, or terrorism). Finally, there is ambiguity which emphasizes the lack of clarity about the meaning of an event, issue, or phenomenon.

The art of strategy and the notion of VUCA both have military origins. The original ideas behind what was to become the VUCA concept emerged in the late1950s and while the end of the Cold War crystallized the notion, the acronym itself was not created until the late 1990s, and it was not until the terrorist attacks of September 11, 2001, that it was developed beyond the security field and began to encroach into the field of strategic leadership. Societal complexity – when addressed via the VUCA approach – has implications for the strategy formulation protocols and mechanisms that occur across all sectors in society (private, governmental, and nongovernmental).

To simplify, we might say that strategy formulators ought to be alerted continuously which consequently has meant that strategy formulations have been replaced with strategic agility. This means that the strategy process is ongoing, not a project. Doz et al. (2018) call for new capabilities to accomplish this change. They are strategic sensitivity, resource fluidity, and finally collective commitment. These capabilities are – as we will explore – essential also in building, maintaining, and strengthening resilience in public institutions as well as defining government resilience as a public policy goal.

### Exogenous and Indigenous Shocks and Resilience Strategies

Exogenous and endogenous shocks affect government and public administration. As they emerge, public institutions react. The research literature typically identifies external shocks as potentially existential threats to the way in which a government functions, or to a public organization's health.

Existing research indicates that organizations will not find it very easy to cope with such shocks. The idea of the resilient organization suggests that unexpected shocks can be dealt with and organizations can emerge from crises without lasting damage. Endogenous shocks emerge internally from the domain of government, public policy, and public organization. They can relate to haphazard policymaking, bad-quality leadership, from a variety of organizational malfunctions and unethical behavior (i.e., corruption), and the existence of organizational siloes and demand failures in service delivery. According to King and Crewe (2013: 5), these malfunctions can be human (caused by *ad hoc* planning, groupthink, haphazard program/project leadership prejudices, panic, and symbolism) or systemic (caused by failures in operational service delivery, policy implementation, and lack of managerial competencies) mistakes.

It is important to notice the relationship between exogenous/endogenous shocks and public policy/public organization. There are two options here relating to how best to describe this relationship. First, resilience can be understood as an adaptation mechanism as noted previously. Boin and van Eeten (2013), for instance, have argued that adaptation can refer to the capacity to absorb an emerging crisis while maintaining a high level of performance or to the maintenance capacity to recover from a crisis over the course of time. Second, resilience can also be conceived of as a policy or an organizational goal in the public sector. Understood from this perspective, resilience is "the capacity of a system to absorb and adjust to change by learning from it" (Colander and Kupers 2014: 200–201). In practice, this process takes place when public institutions set resilience as their operational (i.e., performance management) target and develop learning strategies and mechanisms to develop a set of rules or practices that are then put into practice when shocks emerge and penetrate society or parts thereof.

## The Typology of Adaptation Mechanisms Contributing to Governmental Resilience

This part of the entry briefly summarizes the main components of the adaptation mechanisms that fall under the umbrella of organizational and institutional resilience. The themes discussed include the notion of systems perspective and systemic change, evidence-informed policymaking, meta-governance models and network cooperation, and, finally, risk management.

### Systems Perspective and Systemic Change

The systems view of societal phenomena entails specific requirements for organizing government. This approach includes the idea that societal phenomena are interconnected and thus not easily defined from the perspective of a single public policy. Alleviating the effects of social exclusion and combating against climate change, for instance, cover multiple policy sectors in terms of necessary policy measures to be activated. As a concept, systemic change is equivalent to seeing societal phenomena from the perspective of systems view. From a systems perspective, resilience mechanisms adopted in public institutions are effective only if they are planned and delivered in a public policy domain conceived as a systemic whole. Resilience is a mechanism that has been built into government organizations and agencies as an integral part of their organizational structure, affecting all levels of government.

The effective limits of resilience mechanisms within government is an interesting question. These limits are not organizational between government organizations and other parts and/or sectors of society. Rather, government resilience mechanisms cover all sectors of society – the public, the private, and the nongovernmental. This view holds that it is the government's

responsibility to cover society from the effects and aftermath of exogenous and endogenous shocks. This task calls for cooperation from all vertical layers and horizontal sectors of government and from public organizations as a whole.

Leading change from a systems perspective can be rather confusing. First. the models of change can be conceptualized differently and with great diversity. To put it in simple terms, change models can be defined as incremental or radical, or anything in between. In terms of leadership in these times dominated by exogenous and endogenous shocks affecting public administration and government, the traditional "management" of issues and simply taking care of tasks that strengthen resilience no longer, in themselves, suffice. Leadership is crucial in times of crisis or indeed of multiple crises. The act of leadership highlights the importance of leading with the vision grounded in society's evolvability.

## Evidence-Informed Decision-Making and Accountability

According to Head (2016: 472–473), evidence-based – or perhaps more accurately, evidence-informed decision-making takes into account the complex nature of our societies and the complexities of policymaking and data deployment. Thus, policymaking and public leadership is about making "better use of evidence in policymaking [and they] are closely linked to widespreadpressures for improved effectiveness in servicedelivery and accountability in democratic countries." Public sector leaders at both the political and the top civil service levels are increasingly expected to engage in evidence-informed decision-making in order to make better decisions. Building upon the analysis by Yost et al. (2014), for instance, this evidence-informed decision-making process consists of the collation, analysis, and use of research evidence along with an expert body of knowledge, existing public service resources, knowledge about the service needs of service users, an understanding of service systems, accountability aspects, and the political climate.

The "evidence-based policy" movement gained momentum in the 1970s partly because of the general development trajectories of decision-making theories within political science, political economy, and administrative science. This movement enjoyed support from the perspective of the New Public Management – a leadership and management paradigm within the public sector domain – during 1990s and was also linked with the development of accountability functions in respect of public administration and with putting more focus on organizational efficiency. What is noteworthy here are the limits of evidence-based policy. It is more useful to speak about policies that are evidence informed which is about limiting the kinds of evidence included in policymaking basically to quantative analysis. Acknowledging the limits of evidence is important since policymaking is ultimately about a balance of considerations and relates to how to take on board the scientific advice with a somewhat practicable implementation strategy (as has been the case with the response to COVID19 pandemic in most of the countries).

From the perspective of institutional resilience, internal and external audit of the state budget is an essential component of good governance and public financial management at the governmental level. Audit ensures public funds are used for the purposes intended, that policies and programs are delivered as efficiently and effectively as possible, and that improvements in public management are initiated and conducted. External audit also ensures internal audit and control systems are in place. Audit and oversight form a system of actors and processes that strive to achieve the goal of accountability and improvement in financial management. Therefore, the role of audit is crucial in considering the dynamics of institutional and organizational resilience: it contributes to the idea of doing the right things rather than doing things right, which is a fundament in the philosophy of quality management in organizations (e.g., Crosby 1979).

## Meta-Governance and Cooperation Network Structures

The concept of meta-governance refers, in the context of government resilience, to "governing if governing." This entry holds the view that when profound exogenous or/and endogenous shocks

affect society, "normal procedure" management structures, dynamics, and divisions of labor no longer suffice. This means that organizational and public policy–based leadership and management models are supplemented or replaced by ad hoc – or crises-based management and leadership models that move beyond normal phase management and leadership. Meta-governance and cross-sectoral cooperation are examples of this new leadership dynamic. According to Gjaltema et al. (2019), for instance, meta-governance is "a practice by (mainly) public authorities that entails the coordination of one or more governance modes by using different instruments, methods, and strategies to overcome governance failures." Meta-governance, then, constitutes the forum in which overarching cross-sectoral cooperation can take place.

Meta-governance is effective if cross-sectoral cooperation meta-skills have been identified and systematically trained and practiced. Cooperation meta-skills are incorporated into leadership skills in many ways and refer to generic competencies (and skills) which are by nature both individual and representative of the collective capital of those in public administration and public policy responsible for multilateral cooperation. The scalability of cooperation meta-skills strengthens government's ability to successfully utilize the mechanism of actions and activities which, in turn, contributes to societal resilience. It is also noteworthy that vital cooperation meta-skills are dependent on the administrative and public policy–related contexts in which people operate. It seems that certain cooperation meta-skills are of relevance from the perspective of managing and leading government resilience strengthening processes. These include, for example, (a) dismantling or transcending organizational siloes, (b) mutual sensemaking across organizations, (c) communication, interaction, and co-creation of possible solutions, (d) creating a solutions-focused mindset in dealing with cross-sectoral societal phenomena, and (e) initiating innovativeness.

From a governmental perspective, resilience dynamics affect innovativeness. Rodan and Galunic (2004) have discussed the impact of open networks on innovation management. For them, open and renewable networks provide their members with an opportunity for multifaceted learning and new thinking. Such networks support innovativeness, because they make it possible to combine ideas and insights in a new way. They are multidimensional, helping organizations to prepare for and anticipate future risks. On the other hand, in a close network all members know each other. Closed networks function extremely well in acute crisis management because of strong mutual trust. They are not however particularly resilient when the operating environment becomes more turbulent and the need for continuous change grows. The weakness of closed networks is that they are conservative and slow to obtain and combine new insights.

E

## Risk Management Governance in Public Institutions: Assessment Mechanisms and Models

The term "risk governance" involves the translation of the substance and core principles of governance to the context of risk and risk-related decision-making (van Asselt and Renn 2011). Building upon this, risk governance was a notion introduced into the academic discourse via European networks on risk at the turn of the millennium and is rooted in transdisciplinary work in the interface between risk assessment, risk management, regulatory sciences, public administration, and policy analysis, especially at the EU level. The risk management standard ISO 13000 defines risk as the effect of uncertainty on achieving objectives. Within the domain of public policy, public administration and across the public sector as a whole, risk management practices in the public sector is a fundamental element of strengthening resilience. During the COVID19 pandemic, organizations that have succeeded in terms of business continuity have proven to be resilient: capable of adapting and adjusting.

From contingency planning to efficiency gains in the management of public resources, risk management frameworks address information flows in strategic and operational work while also highlighting possible implementation gaps in policy. Identifying potentially harmful events or

actions and managing the possible responses to them allows organizations to prepare for risks and mitigate their impacts.

Summarizing an effective risk management process consists of the following steps: (1) risk identification and assessment; (2) design of responses to manage risk to an acceptable level; (3) design of risk monitoring; and (4) risk reporting. When integrated into governance structures, risk management supports decision-making in achieving the set objectives at all levels of policymaking. Effective consolidation, aggregation, and assessment of strategic risks require collaboration across administrative branches and governance levels. Tekathen and Dechow (2013) suggest that Enterprise Risk Management (ERM) enhances organizations' capability to work with uncertainty. They note that the ERM process offers great potential because the articulation of risks and chances can accelerate the processes of organizing.

## Case: Finnish Governance and the COVID19 Pandemic

### The Structure of Finnish Government and Public Administration

Finland has approximately 5.6 million people and as of 2.11.2020, it has reported 16,291 cases of COVID19 and 358 related deaths (https://www.worldometers.info/coronavirus/#countries).

Finnish central government is built on specialist administrative branches (see, e.g., Virtanen and Tammeaid 2020). At the central government level, Finland has 12 ministries and their subordinate agencies and funds. These subordinate organizations consist of 65 accounting units, 127 performance-managed agencies (subordinate to 12 ministries), 215 employer offices, and 11 off-budget funds.

Overall, the government's efficiency is attributable to the deep expertise accrued by public officials and the strong mutual trust between different institutions. The operating models and the increase in competence are normally based on linear thinking, i.e., events progressing on a predetermined track, an approach which does not suit crisis situations. Government departmentalization has however entailed to a major extent the creation of organizational silos in the public administration system across all levels of governance – central, regional, and local. Over time, however, bridges across the silos have been built in the form of working groups, task forces, policy inquiries, and councils.

Continuous change across the operating environment and the complexity and interconnectedness of political issues challenge current structures and operating models. The common view among top political decision-makers and their advisers and top civil service representatives is that linearity and strict sectoral specialization should be gradually replaced with a network-based approach allowing for policy coherence and cross-sectoral continuity. Over the years, experiments have been held to achieve this, supported by the Prime Minister's Office, the Ministry of Finance, and other line ministries. Moreover, additional input for this shift – the transformation from departmentalized ministry organizations to more network-based activities – has also been provided by the National Audit Office and the Finnish Innovation Fund Sitra, both of which operate under the auspices of the Finnish Parliament.

### Decision-Making in Crisis Mode Benefited from Large-Scale Digitalization

The Government, working with the president of the Republic, declared on 16 March, 2020 that exceptional conditions as laid down in the Emergency Powers Act prevailed in Finland as a result of the COVID19 pandemic. During the two months following this declaration, unforeseen during times of peace, the Finnish central government succeeded in operating well in these exceptional conditions. The political will was strong to cooperate and to make timely operational responses possible. The acute phase of the crisis highlighted the resilience of the government service response and the exceptionally rapid deliberative and drafting processes from policy preparation to enactment in parliament and implementation by the various agencies involved.

As it stands, the reaction of government organizations since May 2020 has been exemplified by the principles of organizational resilience. Thus, the question is, how has this happened and what drivers made that possible? First of all, the continuity of government operations was possible since networks of competent and committed people set up new (to certain extent ad hoc) operating models and created shortcuts in processes while still operating according to the law and within existing modus operandi protocols. It seems evident – to further promote resilience – that public administration needs to learn from its activities during the crisis and adjust its structures and processes to ensure their flexible compatibility also into a post-crisis future.

Second, one crucial part of the success story is due to the digitalization of public services and government actions prior to the pandemic. Over the years, the digitalization of central government operations and work processes has been a high priority across the Finnish ministries and government agencies, but the shutdown of physical office space since April 2020 created a hitherto unforeseen momentum in terms of this digital leap. Continuity both in terms of public services and of public policymaking showed that public officials had taken up the challenge and adapted their work processes quickly to the new normal. Solid digital data infrastructures and transparent and open information sharing practices showed their value when all actors were working remotely.

## Communication and Dialogue

Finland has prepared for cross-sectoral cooperation based on digitalization and open sharing of information for a long time. In general terms, the data infrastructure is robust and real-time remote access to data is available for all government personnel. During the pandemic, this has become a necessary way of working to enable efficient operations. The June 2020 report (available only in Finnish) by the Digital and Population Data Service Agency steering group VAHTI shows that public organizations were very successful in the rapid move to a general remote work mode and that there were no major cybersecurity issues during the first phase of the response to the pandemic. The report also states that the personnel experienced remote working as successful, albeit the infrastructure capacity was at times lagging due to the unforeseen amount of data transfer required as more than 60% of central government staff in Finland worked remotely.

During May–April 2020, the central government organizations also stated they had also been able to take care of the digital and cybersecurity safety issues during the pandemic lockdown period, although some initial workloads were noted as being higher. Also, the very generalized move to digital meeting practice raised the issue of the security of the platforms and applications used as well as a need for more general guidance on their use. Moreover, the topic of information security has been at the top of the agenda in Finland not only because of the COVID19 pandemic and related remote working, but also because of a cyberattack and information theft against psychotherapy center Vastaamo (private company) – which took place in 2018 but became public knowledge only in late October 2020 indicating that information intruder(s) got hold of the personal data and identities of approximately 40,000 patients.

During the early weeks of the pandemic (March–May 2020), the Finnish central government reached out extensively to local authorities. These contacts proved to be essential in sharing acute and timely information and in strengthening cooperation between the central government and local authorities. Moreover, communication between different ministries also stepped up a level, as supplementary budget proposals were drafted in record time. Public officials showed flexibility and a high capacity to find solutions to speed up the required phases in the legislative process, working in close cooperation across sectors with an emphasis on timely delivery. In practice, the changeover to remote working took place overnight in the central government services. This relied on a general in-built level of technological and cultural preparedness. After some initial difficulties, the centralized ICT services of central government operated well and new capabilities and routines were developed for large-scale

teleworking both within agencies and in cross-sectoral networks.

External communication on the government's response to the crisis was managed centrally from the prime ministers' office. Public support grew as communication was systematic and the clarity of the messages was emphasized. A specific ministerial press conference for children on Covid19 measures was highly acclaimed. Within government agencies, COVID19 response teams monitored the situation from the perspective of continuity of work, the well-being of employees and information management and service users. Efforts were centered on providing timely status information internally and externally and supporting the employees' mental stamina in the period of extensive remote working. In these exceptional circumstances, communications and human resource functions initiated new ways of supporting employees. The orientation programs for new staff were adjusted in accordance with social distancing measures. ICT services were in the front line when it comes to analyzing and responding to these widespread needs. Centralized ICT services were under constant strain, but also allowed for systemic responses to this exceptional situation.

### Institutional Learning

Much ink has already been spilled on the subjects of "organizational learning" and "institutional learning," but little has been said about organizational forgetting, amnesia, and unlearning (Pollitt 2000). From the perspective of Finnish government's activities, the COVID19 pandemic case suggests that institutional learning should focus on two dimensions – learning processes (how learning takes place) and learning outcomes (what has actually been learned).

At the outset, much of the institutional learning that has taken place since March 2020 has been ad hoc in nature. Government agencies have carried out their tasks, solved administrative problems (for instance, concerning public procurement on masks and the necessary supplies of PPE, etc. to hospitals), and tried to learn from failures and mistakes as they emerge.

Moreover, the Finnish government has emphasized the importance of institutional learning – and institutional evaluation – in the course of theCOVID19 pandemic. To this end, the Finnish government set up a special taskforce in October 2020 to carry out an evaluation on the crisis management activities that took place after March 2020. The taskforce is expected to deliver its final report by the summer of 2021.The idea is to carry out an assessment of government agency operations during the crisis.

From the perspective of the accountability and trustworthiness of government activities, this assessment is important because in addition to its crisis-related activities, the public administration also continues to prepare internal reforms and decisions that are in themselves significant. Government-wide evaluation aims at contributing to institutional learning. It is based on prior separate reports on specific issues flagged as problematic during the acute phase of the crisis, such as procurement actions and the setting up of new state aid systems, while also launching wider evaluation reports on the governmental response to the crisis more generally. The various coordination networks reflect on the initial responses and on the continuity of public services when setting up new processes. Additionally, the Finnish public sector has also engaged in strategy work based on a wide dialogue with stakeholders.

Overall, the pandemic has engendered an acute understanding of how important it is to proactively maintain the public authorities' crisis preparedness. It is particularly important here to agree on the procedures governing collaboration, management procedures (and related division of labor issues), and to keep information up to date. This also applies to preparing for crises affecting the financial system and preparedness in respect of making quick financial and budgetary reallocations. It seems that the resilience of the public administration and governance should be supported by investing in public officials' competence development and goal-oriented networking. Staff mobility, expertise, and the cross-pollination of insights are tools through which the public administration can improve its resilience and

learning. The public administration should also network with the private and third sectors as well as national think tank and research providers. This comes close to what Aldrich and Meyer (2015) have underlined as the importance of social capital in building resilience in disaster and external shock situations. They describe loosely connected ties between individuals as "bridging social capital." These ties are "more likely to display demographic diversity and provide novel information and resources." The systematic development of policy-makers' networks could thus improve resilience in unforeseen situations.

To conclude, institutional learning has a multitude of platforms open to it. One of the current issues in Finland is the need to encourage the cross-sectoral mobility of employees and particularly of top civil service officials. This would increase the opportunities to share best practice and learn from the diversity of government organization's experience in managing situations such as the COVID19 pandemic. Internal and external audit are also relevant channels for providing insight for institutional learning given that they work with a focus on future-proofing the audited institutions.

Conceptually, Simons (1995) has argued that multiple levels of control systems contribute to the strategic renewal of organizations: financial and cost-accounting systems, belief systems that communicate core values such as mission statements, credos and vision statements, boundary systems that define the limits of freedom, such as codes of conduct and ethics statements, and interactive control systems that provide strategic feedback and vehicles to update and redirect strategy. Continuous institutional learning harnesses the power of these four different control systems. In the government administration, emphasis needs however to be placed on inter-institutional communication and the sharing of perspectives. The "silo" structured nature of the public administration needs active dialogue between its different parts and different levels of actors. Head (2016) points to the fact that only a small part of senior staff "are positioned to understand and influence the 'big picture', including interinstitutional relationships and the changing information requirements across various elements of the policy process."

From the perspective of learning in times of crisis, Senge's (1990) distinction between organizational learning modes deserves attention and is relevant from the perspective of institutional learning in relation to Finnish central government agencies during the current crisis. Senge writes about adaptive and generative learning, noting that adaptive learning refers to the capability to make the necessary judgments in times of crisis and to organizational coping – i.e., getting through troubled times by making the necessary adjustments. Generative learning, then, is about creating and/or looking for new possibilities and solutions – i.e., getting through troubled times by looking for new solutions and striving for new innovations (processes, services, and ways of cooperation). From the perspective of the COVID19 pandemic, both of these learning modes are necessary in terms of coming out of crises stronger and better equipped for future challenges. These learning modes call for strong public leadership both from the political level and from top civil servants.

## Conclusions

Schwab (2015) has aptly described the impacts of the fourth industrial revolution on legislative work and policy preparation by underlining that we need resilient governance, based on extensive interaction and networks and public officials' continuous renewal and understanding of the changes in their operating environment. Schwab concluded that decision-makers are too fixated on traditional linear thinking. Their time is spent on constant crisis management. They therefore lack the time to think strategically about how the forces shaping our future will impact our operations. Building upon Schwab's point, resilience can be defined from various perspectives. It can refer to individual, collective, or – as this entry suggests – organizational or institutional aspects

of adaptation and recovery. It is important to note that resilience has been widely viewed as a potential solution to the challenges posed by crises and disasters. The promise of resilience is an organization or society that absorbs shocks and "bounces back" after a disturbance. While the idea of resilience is increasingly popular, empirical research on resilient organizations has thus far actually been quite rare. As such, the COVID19 pandemic provides an interesting test laboratory for this kind of analysis.

This entry suggests that information and knowledge gaps continue to exist in terms of what happens inside government agencies and institutions in relation to producing, assessing, and incorporating resilience mechanisms into their policymaking, service delivery, regulatory aspects ("lockdowns"), and fulfilling government's role in the age of turmoil caused by internal and especially external shocks.

From a public policy perspective, resilience can be defined in two ways. First, it refers to an adaptation mechanism activated by societal complexity. The nature, dynamics, and functions of this adaptation mechanism build upon government structures and the traditions of the given administrative–political systems in the country in question. As far as the institutions and organizations in the public domain are concerned the contents of resilience can be addressed as property, ability, or capability. In practice, resilience as an adaptation mechanism requires strategic sensitivity, resource fluidity, and a collective commitment among political decision-makers and government officials, particularly top civil servants. Second, resilience can be conceived of as a policy or organizational goal in the public sector. Understood from this perspective, resilience connects strongly with foresight dynamics and is an intentional act under the umbrella of the policy agenda aiming to strengthen the government system's capacity to absorb and adjust to change by making plans for adaptation, delivery mechanisms, and learning protocols from it.

Figure 1 summarizes the analysis and discussion in this entry. It concludes that the institutional resilience drivers form the institutional preconditions (the "framework") which is then affected by internal and external shocks.

Summarizing, in times of an acute crisis, such as the governmental response to the COVID19 pandemic, resilience can be expressed as the

**Exogenous Shocks, Resilience, and the Evolution of Public Governance, the Case of Finland, Fig. 1** Institutional resilience model of Finnish government agencies during the COVID19 pandemic

*agile reshaping of processes and workflows with the aim of guaranteeing business-as-usual continuity in government operations.* It is easy to share the view put forward by Duit (2016) who argues that there is a perceived need for governmental reliability and robustness in an increasingly complex and unpredictable world. A comprehensive system of planning, control, and learning tools and networks is needed to ensure government-wide actions with the aim of increasing resilience. All in all, the Finnish government case in respect of its activities during the COVID19 pandemic clearly highlights the impact of solid networks and inter-institutional and interpersonal trust as factors enhancing the capability of the public administration to respond in a timely and purposeful fashion to this novel situation. To improve institutional resilience, public authorities benefit from opening up their networks to foster a wider understanding of change factors, risks, and opportunities that lie beyond their own institutional focus or experience. Social capital has a profound impact on the rapidity of a government response to a crisis situation.

This entry concludes that institutional resilience in Finnish government has a largely unrecognized and unappreciated dual character; it displays both adaptive and systemic dimensions. It also appears that theories of institutional learning and the notions of adaptive and generative learning offer useful prospects for further scrutiny. The empirical considerations in this entry in respect of the Finnish case suggest that institutional resilience builds upon (a) the competence of government agencies as well; (b) the institutional drivers that relate to the digitalization of information systems making possible evidence-informed decision-making; and (c) agile ad hoc networking and cooperation models, which are – once put in place – self-reinforcing phenomenon that can help societies to manage and cope with external shocks. There are a number of possibilities for a future research agenda here around the topic of institutional resilience within the framework of government organizations. These include a more detailed empirical cultivation of the role of leadership in crises, i.e., leadership models and practices that strengthen institutional resilience. Moreover, further analyses with regard to remote working in the context of public organizations could also be of interest. Such analyses would necessarily involve investigating the processes that increase data security and alleviate the effects of possible cybercrimes. This is definitely one of the major challenges facing the decentralized and network-based information systems of resilient institutions and, as such, merits further empirical research.

# Expectancy Theory in Organizations

Anna A. Filipova
Department of Public Administration, University of Wisconsin Oshkosh, Oshkosh, WI, USA

## Synonyms

Ideal bureaucracy of organizational theory; Instrumentality theory; Participative management; Path-goal theory

## Definition

People will be motivated to the degree that they believe that effort will yield acceptable performance (expectancy), the performance will be rewarded (force/instrumentality), and the value of the rewards is highly positive (valence) (Vroom 1964).

A person's motivation is a function of effort-to-performance expectancies, performance-to-outcome expectances, and perceived attractiveness of outcome (Lawler 1981).

## Introduction

Expectancy theories gained popularity in the 1960s, 1970s, and 1980s (Vroom 1964; Porter and Lawler 1968; Lawler 1981). Victor Vroom's (1964) theory posits that people will be motivated to the degree that they believe that (1) effort will yield acceptable performance (expectancy), (2) performance will be rewarded (force/instrumentality), and (3) the value of the rewards is highly positive (valence). The interactive

combination of all three influences motivation. The stronger the valence or value of the reward and the stronger the expectancy that a person's efforts will be successful and result in the reward, the stronger the motivational force to engage in that behavior. Within the field of public administration, expectancy theory has been used as theoretical framework for understanding topics, such as motivation in public and private sector organizations, pay-for-performance and performance appraisal, contracted provider motivation, free rider problems, risk culture, and mission valence.

## Theoretical Perspectives

### Vroom's Theory of Work and Motivation

Vroom's (1964) expectancy theory starts with the assumption that, at any given point in time, a person has preferences or "valence" among outcomes or states of nature. As a basis for establishing the valence of a specific outcome, Vroom (1964, p. 17) sets forth the following proposition: "The valence of an outcome to a person is a monotonically increasing function of the algebraic sum of the products of the valences of all other outcomes and his conceptions of its instrumentality for the attainment of these other outcomes." Vroom specifically applies this first proposition to the topics of occupational choice (calculation of the valence of an occupation), job satisfaction (calculation of the valence of a job held), and job performance (calculation of the valence of effective performance in a job held) (Miner 2002).

Another central variable in the theory is "expectancy," defined "...as a momentary belief concerning the likelihood that a particular act will be followed by a particular outcome" (Vroom 1964, p. 17). According to Vroom (1964), differences exist between the concepts of expectancy and instrumentality. Expectancy is perceived as an action-outcome association, taking values from 0 (no probability that an act will be followed by an outcome) to 1 (indicating certainty that this would happen). In contrast, "instrumentality" is an outcome-outcome association. It can take values ranging from −1 (the second outcome can be attained without the first outcome) to +1 (the first outcome is necessary and sufficient condition for the attainment of the second outcome).

Expectances combine with total valence to yield a person's motivation. Vroom (1964) uses the term "force" to describe this combination. "The force on a person to perform an act is a monotonically increasing function of the algebraic sum of the products of the valences of all outcomes and the strength of his experiences that the act will be followed by the attainment of these outcomes" (p. 18). People are expected to choose rationally among action alternatives to maximize force in a positive direction.

### Porter and Lawler Theoretical Model

Porter and Lawler's (1968) theoretical model holds that the variables "value of reward" ("how attractive or desirable a potential outcome of an individual's behavior in the work situation" p. 18) and "effort-reward probability" ("an individual's perceptions of whether different rewards are based on differential amount of effort on his or her part in the work situation" p. 21) when multiplied together are said to produce a third variable "effort" ("the energy expended to perform some task but does not necessarily correlate with how successfully the task is carried out" p. 23). "Abilities and traits" of a person and "role perceptions" ("the way in which the individual defines his job" p. 25) also have multiplicative relationships to "effort" in determining "performance (accomplishment)" ("a person's accomplishment on tasks that comprise the job" p. 28) (Porter and Lawler 1968). Porter and Lawler also posit that to the extent that performance does result in "rewards" ("desirable states of affairs that a person receives from either his own thinking or the action of others" p. 29) and those "rewards" are perceived as "equitable rewards" ("the amount of rewards that a person feels is fair, given his performance on tasks he has been asked to undertake by the organization" p. 30) it would result in "satisfaction" ("the extent to which rewards actually received meet or exceed the perceived equitable level of rewards" p. 31). When "satisfaction" is experienced after receiving a reward, it tends to influence future "value of the reward." The nature of this effect varies with the reward.

The authors conducted the most extensive empirical study, using a sample of managers. Two changes were introduced in the model. The first defined rewards as "extrinsic rewards" (administered by the organization) and "intrinsic rewards" (administered by the individual himself) (p. 163). The second one linked "performance" to "perceived equitable rewards" (p. 164). The results showed an inferential, but indirect, support for the causal relationships in the model. Specifically, (1) determinants of pay were more closely related to effort than to performance, (2) the relationship between determinants of pay and performance was moderated by importance attached to pay, (3) the positive relationship between role perceptions and performance was greater for managers rated high on effort than those rated low in effort, and (4) the relationship between performance and satisfaction with pay held only for managers for whom performance was related directly to their actual pay (pp. 165–166).

### Lawler's Expectancy Theory Model of Behavior

Lawler's (1981 pp. 21, 231 and 234) expectancy theory model posits that "a person's motivation is a function of: (a) effort-to-performance expectancies; (b) performance-to-outcome expectances; and (c) perceived attractiveness of outcome." In this model, "effort-to-performance expectancy" ($E \rightarrow P$) refers to "...the person's subjective probability about the likelihood that he or she can perform at a given level, or that effort on his or her part will lead to successful performance... A person's $E \rightarrow P$ probabilities are also strongly influenced by each situation and by previous experience in that and similar situations" (p. 230). "Performance-to-outcome expectancy" ($P \rightarrow O$) and valence ($V$) refers to "...a combination of a number of beliefs about what the outcomes of successful performance will be and the value or attractiveness of these outcomes to the individual...the more likely a person feels that performance will lead to valent outcomes, the more likely he or she will be to try to perform at the required level" (p. 232). Each outcome has its own valence. Some outcomes are valent because they have direct value or attractiveness, others have valence because they lead to the attainment of other "second level" outcomes. Each outcome may be intrinsic (e.g., feelings of accomplishment, personal worth, etc.) or extrinsic, i.e., positive or negative outcomes obtained from environment (e.g., supervisors, co-workers, the organization's reward system, or other sources). Motivation then is expressed as follows: $M = [E \rightarrow P] \text{ X } \sum [(P \rightarrow O)(V)]$ (p. 231). The model further suggests that "...as a result of obtaining of outcomes and perceptions of the relative value of the outcomes obtained, the individual has a positive or negative affective response (a level of satisfaction or dissatisfaction) (p. 235). Further, "that events which occur influence future behavior by altering the $E \rightarrow P$, $P \rightarrow O$, and $V$ perceptions. This process is represented by the feedback loops running from actual behavior back to motivation" (p. 215).

## Motivation and Occupational Choice in Public and Private Sector Organizations

### Motivation in Public and Private Sector Organizations in the United States

Public-private differences in work effort may exist because the two sectors differ in the rewards they offer or the workers they attract. Private businesses may be better structured to link external motivators to individual productivity, but government work may be intrinsically more satisfying (Frank and Lewis 2004). Jurkiewicz et al. (1998) challenged the perspective that public sector employees were more motivated by job security and stability, teamwork, and worthwhile service to society, while eschewing monetary rewards, prestige, the desire for challenge, and autonomy as compared to private sector employees. The authors found that, in fact, monetary rewards and need for security and stability were of much greater concern to public employees. However, there were no significant differences between the employees in the two sectors when it came to teamwork. The findings support the view that environmental, societal, and economic pressures influenced the two sectors equally.

Using 1989 and 1998 data from the General Social Survey, Frank and Lewis (2004) found that private sector employees valued high income and advancement opportunities more—and interesting work, helping others, and being useful to society less—than public sector employees generally. In both sectors, "an interesting job that allows one to help others and a strong desire for job security appeared to increase the probability that one will put in extra effort" (p. 46). The absence of sectoral differences in the motivational effects of high pay and advancement opportunities suggested either that "(a) the link between performance and reward is not appreciably stronger in the private than in the public sector, (b) these extrinsic motivators have little impact on work effort in either sector, or (c) these variables are measured too crudely in this study to capture the size of their effects." (p. 47). The researchers conclude that higher pay and pay for performance should have similar effects in the public as in the private sector.

### Motivation in Public and Private Sector Global Organizations

Georgellis et al. (2010) investigated whether intrinsic motivation affects the sorting of employees between the private and the public sectors, paying particular attention to whether extrinsic rewards crowd out intrinsic motivation. Using the British Household Panel Survey longitudinal data, the authors found that higher satisfaction with the nature of the work itself, the proxy for intrinsic motivation, increased individuals' propensity to make the transition from the private into the public sector. In contrast, higher satisfaction with extrinsic job characteristics did not raise the probability of such transition. The results suggest that individuals are attracted to the public sector by the intrinsic rather than the extrinsic rewards that the sector offers. Further, that extrinsic rewards in the public sector crowd out intrinsic motivation, in that, higher earnings and satisfaction with the extrinsic job characteristics reduce individuals' propensity to accept employment in the public sector. However, such evidence was only found in the higher education sector and the National Health Service. Whether lower extrinsic rewards could increase the quality of job matches in the public sector, thus improving performance without the need for incentives was questioned.

## Pay-for-Performance and Performance Appraisal in Public Organizations

### Pay-for-Performance and Performance Appraisal in the US Public Organizations

Beginning with the federal Civil Service Reform Act of 1978, academic and managerial attention have focused on pay-for-performance (PFP) compensation as a method of increasing public employee productivity (Condrey and Kellough 1993). Merit pay, a dominant type of PFP program, had the following features: "(a) the focus is on the individual performance, (b) performance is measured subjectively, such as through a performance appraisal system, (c) pay increases are based on measures of past performance, and (d) the pay raise is built into base pay or is received as a one-time bonus" (Heneman and Young 1991, p. 36). Due to the merit pay system's shortcomings, in 1984, Congress created the Performance Management and Recognition System (PMRS) (Pearce and Perry 1983). The PMRS had three components: "the annual comparability adjustment, based on private sector rates; the merit increase; and performance awards, which are one-time awards not added to base pay" (Eisenberg and Ingraham 1993, p. 119). The legislation prohibited the use of quotas to determine the proportion of managers at each level, but managers who received Fully Successful or higher ratings annually were to receive a merit increase (Eisenberg and Ingraham 1993).

Several studies have investigated expectancy theory within the specific context of PFP systems with the goal of verifying its assumptions. For example, Pearce and Perry (1983) hypothesized that the merit pay initiative of CSRA was expected to result in higher performance among federal managers than under the previous compensation system. They analyzed data from employees in five federal agencies. The results indicated that the performance appraisal system did not

effectively measure performance, and therefore did not serve the purpose of the merit pay program to link pay to performance. Other implementation contingencies, such as the pay cap on managerial salaries, uncertainties associated with the presidential transition, and an eleventh-hour change in the merit formula had also contributed to the ineffectiveness of merit pay. Although merit pay was desirable in principle, its effectiveness might be severely constrained or negated within the federal sector.

Perry et al. (1989) analyzed the effectiveness of the PMRS using a sample of managers from the US General Services Administration. The results indicated that PMRS had some positive effects on performance in 1986 but that they were substantially reduced in 1987. Specifically, the ability of financial rewards to predict performance was significantly poorer in 1987 than in 1986. Among the factors contributing to this decline were "...organizational learning, design factors associated with limits imposed by salary ranges, and declining validity of performance appraisals" (p. 35). They concluded that PMRS has not achieved its ultimate objective, i.e., improving performance in the federal sector.

Heneman and Young (1991) evaluated the effects of a Merit Award Program on the motivation of 120 managers of schools in an American district. Results showed that the new merit pay program did not motivate managers. This could be explained, first, by the low expectancy perceptions of the administrators due to the vagueness of the merit award criteria, supervisors' expansive span of control, supervisors lacking skills in evaluating performance, and lack of initial communication about the new program. Second, instrumentality perceptions also were low due to poor communication of the availability of awards, perceptions of the political nature of the awards distribution, and the equity in the distribution. Third, valence perceptions also were low because an increment to base salary was more desirable than winning a merit award, the size of the award was perceived to be too small, and the valence of the merit award (whether won or not) was lowered because of its implications for the occurrence of other outcomes, such as embarrassment and social ostracism.

Streib and Nigro (1995) explored the use of PFP in local governments by presenting findings from a national survey of personnel directors in municipalities and counties. Most respondents viewed PFP as a useful tool, even though it was only used in minority of local governments. About half of managers perceived improvements in managerial control and a stronger relationship between rewards and performance. However, the majority expressed uncertainty when it comes to satisfaction and group productivity. Uncertainty was lowest for individual and organizational productivity. Some problems associated with PFP included discriminating among performance levels, equitable distribution of performance rewards, union resistance, employee distrust, conflicts between raters and rates, a lack of employee confidence in evaluation techniques, and excessive demands on supervisor's time.

Kellough and Nigro (2002) conducted a study on the effects of performance-related pay on the motivation of the civil servants of the State of Georgia. A substantial majority of the respondents disagreed that the PFP system was a good way to motivate state employees; that their pay was based on how well they did their job (and there was no significant difference between supervisors and nonsupervisors); that their work was appraised fairly to exert the necessary level of effort; and that state funding was made available to reward good performers with good pay increases. In addition, an often-cited concern about PFP system in Georgia was its heavy reliance on monetary incentives rather than on other sources of motivation. These results demonstrate that the link between performance-related pay and work motivation was mostly negative and that favoritism had undermined PFP in the agencies.

## Pay-for-Performance and Performance Appraisal in Other Nations

Eisenberg and Ingraham (1993) evaluated the relative effectiveness of several kinds of PFP plans in several nations, including, Canada, Australia, Sweden, the Netherlands, and New Zealand. Although they found substantial variation in the intent, design, and level of financial support in the PFP plans across nations, the commitment to PFP

remained strong. The authors (1993, p. 127) suggest that the PFP system can work if the following is present: "...an appraisal process that is perceived to be fair, a clear link between appraisal and pay, a level and combination of rewards that is valued by public employees, and enough money to provide the necessary incentives on a predictable basis. In addition, there must be a willingness on the part of all officials in the program (and in the political arena) to understand the intricacy and complexity of these systems and to give them a grace period before judgments are made."

Marsden and Richardson (1994) studied the effects of performance-related pay on the work motivation, using a sample of 2423 civil servants of the Inland Revenue. The researchers found that a majority of the Revenue staff supported the principle of performance-related pay, and they believed that they were capable to perform at the desired level of performance. However, almost half believed that even if their performance were good enough, it was doubtful that a performance pay award would be given. This belief reduced staff motivation to change their behavior. In addition, only few felt that the financial reward would influence them to change their behavior. Because two of expectancy theory's three conditions were not met, the authors concluded that the Revenue's system of performance pay failed to motivate staff. It was not the amount of money involved, but whether money was allocated fairly among staff.

## Contracted Provider Motivation

Lambright (2010) examined how well expectancy theory explains contracted provider motivation to properly use service-monitoring tools. Three conditions were suggested for a contracted provider to be motivated: "(a) the contracted provider believes that if it tries to use a tool properly, it will be able to use the tool properly; (b) the contracted provider believes contract rewards and/or penalties are based on whether the government thinks it is properly using the tool; and (c) the contracted provider values receiving these rewards and/or avoiding these penalties." (p. 380). The second type is the rewards and penalties that a contracted provider could receive based on whether the tool showed the provider satisfied the government's performance criteria. For contracted providers to be motivated because of the second type of rewards and penalties, three conditions must be met: "(a) The contracted provider believes that proper use of the tool will demonstrate its satisfaction of the performance criteria established by the tool, (b) the contracted provider believes that contract rewards and penalties will be based on satisfaction of the performance criteria, and (c) the contracted provider values receiving these rewards and/or avoiding these penalties" (p. 381). The author found that the expectancy theory did not appear to consistently explain contracted provider motivation and that it might explain these phenomena under conditions of uncertainty.

## Overcoming the Free-Rider Problems

Powers and Thompson (1994) suggest that the production of public services does not depend only on the behavior of public officials. Time, effort, and skills contributed by citizens are often critical to the provision, production, and delivery of public services. The researchers examined how to design and organize the delivery of public services to promote the kinds of coproduction needed to make public efforts effective and productive. Based on expectancy models, the study emphasizes the importance of providing citizens with an understanding of what is expected of them if they are to contribute to service production and delivery, the capacity to meet those expectations, and an incentive to do so. The authors also suggest that human resource management practices should provide incentives to public employees to encourage citizens to contribute their attention and efforts to the production and delivery of social services. This may be an appropriate strategy for community activities, such as cleaning streets, removing snow, renovating and maintaining public buildings and parks, and so on. Voluntary participation in community-approved activities is often intrinsically satisfying to many, especially when it leads to visible, positive consequences (p. 190).

## Risk Culture

Bozeman and Kingsley (1998) suggest that the concept of risk culture pertains to managers' perceptions that their co-workers and superiors take risks and promote risk-taking. Based on expectancy theory, the authors hypothesized that managers would perceive lesser risk-taking when there was a low expectation that good performance will be rewarded. Four variables were used to assess the link between rewards and total risk: promotion by quality of work, pay based on longevity by rule, promotion based on performance by rule, and rule making promotion of good manager hard. The most significant variable was promotion based on performance by rule. Managers who agreed that rules encouraged promotion based on performance were more likely to perceive the organizations as having risk-oriented cultures. Similarly, managers who perceived rules as "1) dictating links between pay and longevity, and 2) increasing the difficulty for good managers moving up faster than poor ones, were *less* likely to perceive their organization as having a risk-oriented culture" (p. 115). The implications are that "if would-be risk-takers can, as part of their risk calculations, have some confidence that the fruits of their risk (at least the ones that succeed) will translate into reward, promotion or some form of recognition, then the risk taker is better informed, more likely to be acting on the basis of perceived self-interest and, generally, is making a better decision" (p. 117).

## Mission Valence

Rainy and Steinbauer (1999) developed a theory to explain the effectiveness of government organizations. The theory includes the following components: supportive behaviors from external stakeholders; agency autonomy in refining and implementing its mission; high "mission valence" (an attractive mission); a strong, mission-oriented culture; and certain leadership behaviors. These factors enhance motivation – task motivation, mission motivation, and public service motivation – that can be differentiated but that must be linked together in effective government agencies.

The concept of mission valence, in particular, draws on the concept of valence from expectancy theory of work motivation. The mission has higher valence when it has higher levels of the following dimensions: "difficult but feasible, reasonably clear and understandable, worthy/worthwhile/legitimate, interesting/exciting, important/influential, and distinctive" (p. 3). The more "engaging, attractive, and worthwhile" the mission is to people, the more the agency will be able to attract people to join the agency, earn their commitment, and motivate them to perform well (p. 16). The authors (1999) suggest that mission motivation will further depend on employees' views of the relationship between work and the mission. When an individual is motivated by the mission, they will put extra efforts and perform in ways that are perceived to be related to accomplishing the mission. This pattern of motivation differs from public service motivation. While the latter focuses on "altruistic service" that benefits a community or a larger population, mission motivation focuses specifically on the agency mission (p. 25).

## Criticism of Expectancy Theory

The early research on expectancy theory was far from conclusive in that the theory often emerged as invalid in a specific context, and, even when validity was established, the correlations tended to be low (Miner 2002). Pinder (1984, pp. 146–147) identified several typical mistakes made by researchers interested in expectancy theory. First, the low validity, reliability of valence, instrumentality, and expectancy measures had caused underestimates of the validity of the theory. Second, researchers used mostly cross-sectional research designs, in spite of the fact that theory spoke of changes, at one point in time, of *V*, *I*, and *E* perceptions being predictive of changes of effort at some subsequent point in time. Third, some studies used incorrect mathematical procedures for testing the interaction effects between effort and ability. Fourth, multiplication in the formula assumed that valence, instrumentality, and expectancy beliefs were independent of one another; however, this might not be the case. Fifth, the

theory assumes that people are rational, and people have limited cognitive capacities. Finally, some studies used supervisory performance as the criterion against which predictions of employee force was compared. Now, studies are designed in ways that yield not only significant results but also correlations well above those that were typical in early research (Miner 2002).

Lawler (1981, p. 23) also notes that "... Tying rewards to performance requires a good measure of performance, the ability to identify which rewards are important to particular individuals, and the ability to control the amount of rewards an individual receives. None of these things are easy to accomplish in most settings – a fact that has led some to conclude that it is not worth trying to relate pay rewards to performance."

A few scholars have also criticized expectancy theory for failing to distinguish between conditions of certainty and uncertainty (Lambright 2010). It is unclear what the theory would predict when any of its conditions defining effort, instrumentality, and valence are not met. For example, on all levels of government in the United States, PFP systems have been chronically underfunded by legislative bodies (Kellough and Nigro 2002). As a result of the uncertainty of reward availability or the small size of rewards, the motivational impact may be diminished.

## Conclusion

Even though expectancy theories do not explain all motivated behavior in all types of organizations, they do explain enough to be worth pursuing (Miner 2002). Public administration studies show that there is general empirical support for the three individual components of expectancy theory: (a) the link between expectancy and motivation, (b) the link between instrumentality and motivation, and (c) the link between valence and motivation. However, researchers suggest that the circle of valence-instrumentality-expectancy can be broken at a number of points. Further, there are many factors that are continuing features of the public sector organizations that affect the utility of expectancy theory. For example, although merit pay is a desirable principle, its effectiveness may be "severely constrained or negated" within a government setting characterized by "inherently ambiguous performance environment, tight budgetary restraints, freedom of information about individuals' salaries, diffuse authority for implementation, a major managerial succession, and significant changes in organizational goals" (Pearce and Perry 1983, p. 324). Researchers (Lawler 1981; Brundey and Condrey 1993) suggest that managers will be more motived when they perceive a firm linkage between pay and performance; when a climate of trust, credibility and commitment exists in the organization; and when the merit pay system is administered fairly and accurately. Through careful design and implementation of merit-based plans, government might enhance managers' positive attitudes toward the system and their motivation (Brundey and Condrey 1993).

## Synonyms

Student philanthropy

## Definition

Experiential philanthropy is an innovative service-learning pedagogy in nonprofit management education. The pedagogy is intended to integrate academic learning with community engagement by allowing students an opportunity to study social problems and nonprofit organizations and then make decisions about directly or indirectly investing funds in them. Ultimately, experiential philanthropy is intended to teach students not only about issues associated with the management of nonprofit organizations but also about how to evaluate philanthropic responses to social issues.

## Introduction

Experiential philanthropy is an innovative service-learning pedagogy that allows students to study nonprofit organizations and social problems and then directly or indirectly invest funds into nonprofits they believe are best able to solve the social problems they have learned about. This pedagogical approach aims to teach students not only about the theories and practices of nonprofits and philanthropy but also about how to evaluate philanthropic responses to social issues. Experiential philanthropy also aims to benefit nonprofit organizations by providing these organizations with critical resources and access to a potential supply of new and highly motivated donors. Given these dual aims, some scholars have begun to view experiential philanthropy as an important strategy to engage students in the learning process and connect them to communities.

This entry is on the topic of experiential philanthropy. The entry begins with a brief discussion of service-learning, which is the root of experiential philanthropy. Next, the topic of experiential philanthropy itself is introduced, followed by an overview of empirical evidence of its effectiveness on both students and communities. The entry then provides an overview of recent studies on experiential philanthropy and, finally, examines the potential for using experiential

philanthropy as a pedagogic approach to public administration and public policy education.

## Service-Learning: The Root of Experiential Philanthropy

Before discussing experiential philanthropy as a pedagogic strategy, it is first important to provide an overview of service-learning – which is the root of experiential philanthropy.

### A Brief History of Service-Learning

Service-learning is a teaching and learning strategy that integrates meaningful community service with instruction and reflection in order to enrich student learning experiences, teach civic responsibility, and strengthen communities. The concept of service-learning reflects the educational philosophy of John Dewey, who was a proponent of "progressive education" and believed that one of the most effective ways to acquire knowledge was through reflection on concrete situations and challenges.

On the basis of Dewey's educational philosophy, especially about how students absorb knowledge, many professional disciplines such as agriculture, engineering, and social work were among the first to implement service-learning activities into pedagogical practice. For example, the Michigan Agricultural College founded in 1857 was one of the earliest colleges to *require* that, as a condition of graduation, students participate in manual labor in the community for at least 3 h per day (Zieren and Stoddard 2004). This labor was often related to students' courses and their field of study.

Since this time, and in particular since the 1960s, service-learning has grown exponentially in higher education and is being incorporated into disciplines beyond merely those in professional domains (Zieren and Stoddard 2004). Indeed, service-learning has now become recognized as a key component of the curriculum in a multitude of degree programs. Today, most colleges and universities incorporate some form of service-learning activity into their curriculums. These activities can range from one-time course requirements to semester-long service experiences.

### Key Empirical Contributions on the Topic of Service-Learning

Over the years, there has been an abundance of research on service-learning. These studies have consistently shown that by connecting learners and communities, participation in service-learning activities has a positive impact on student learning and development (Markus et al. 1993; Conway et al. 2009). Despite the abundance of service-learning research, though, prior to 2000 the majority of this research was descriptive. For example, many studies merely provided accounts of programmatic and course outcomes that did not rely on rigorous research designs (Eyler, Giles and Gray 1999). Therefore, these early studies often failed to clarify whether it was actually service-learning that benefited students or whether other classroom- and student-level factors were at play.

Fortunately, service-learning research has become increasingly more sophisticated since this time. Indeed, there is now a broader and more complex array of studies assessing the value of, and mechanisms behind, service-learning. Although this increase in research quality is good in terms of enhancing our understanding of the utility of service-learning, it is now difficult to pinpoint important contributions.

A survey of research on service-learning provides insights into emerging research trends on the topic of service-learning. Specifically, this section summarizes "hot topics" and associated findings based on the most frequently searched keywords as well as the most cited service-learning according to research articles collected by *Web of Science* from 1983 to 2016.

The earliest study identified is a field experiment by Markus et al. (1993), which compared students participating in service-learning activities with those not participating in

service-learning activities. These researchers assessed differences in students' awareness of social problems as well as in their academic performance. They found strong empirical evidence of the effectiveness of community-based service-learning in a classroom setting.

Another key contribution to the service-learning literature during this period was Barbara Jacoby's (1996) edited book, *Service-Learning in Higher Education: Concepts and Practices*, which provided a better understanding of how to practically develop and administer service-learning initiatives. Indeed, Jacoby and colleagues provided frameworks for implementing service-learning and guidelines to determine successful implementation. Their work highlighted the need for faculty and administrators to make *intentional linkages* between community service activities and specific course-related learning and development outcomes.

A more recent contribution to the literature is from James Conway et al. (2009). In their work they relied on meta-analytic techniques to synthesize recent empirical studies on service-learning. After analyzing over 100 studies, Conway and colleagues found that service-learning has its largest effects on students' academic and social outcomes, and it has smaller effects on students' personal and citizenship outcomes. Additionally, they found that more structured, intensive, and longer duration service-learning activities tend to result in larger effects on student outcomes (Conway et al. 2009).

An examination on frequently cited keywords used in service-learning research from 1983 to 2016 helps to provide insights into important topics in the service-learning literature as well as emerging research trends. The largest group of research is *community-centered service-learning and international service*. On the one hand, this could indicate that most of the research on service-learning has focused on topics relating to community issues, both, domestically and internationally, which would certainly be consistent with the goals of service-learning. On the other hand, this could also indicate that despite research showing service-learning has its largest effects on students' academic and social outcomes, scholars have focused much of their research on assessing the effects of service-learning on communities.

Keywords of service-learning literature also show that it is now an important topic across disciplinary and geographic boundaries. Indeed, the literature labeled nursing education | international service, which is the second largest and the most recent group of studies, suggests that service-learning is now being incorporated into various disciplines – including nursing education. "International service" is also frequently included among the top clusters, showing geographically broader adoption of service-learning in the context of an increasingly globalized society. In sum, this review of key studies and "hot topics" on service-learning provides an important foundational basis for the study and practice of experiential philanthropy.

## Experiential Philanthropy: A New and Innovative Service-Learning Pedagogy

As a form of service-learning, experiential philanthropy focuses on educating students about nonprofit organizations and social issues. Experiential philanthropy encourages students to apply data collection techniques and critical thinking skills to better understand community needs and evaluate how nonprofits are meeting those needs; it then allows students to actively work toward improving their communities through the distribution of philanthropic funding. Thus, experiential philanthropy is believed to provide students with a better understanding of nonprofit management challenges – particularly those relating to fundraising, performance management, and grant making. For these reasons, experiential philanthropy has been well received within nonprofit management education.

By some estimates, there are currently more than 100 experiential philanthropy initiatives at colleges and universities across the USA (Stuart 2012); and, for the past decade, both the *Once Upon a Time Foundation* and the *Learning by Giving Foundation* – two of the nation's largest funders of experiential philanthropy – have contributed millions of dollars to support various

forms of philanthropy-based education at US institutions of higher learning (Learning by Giving Foundation n.d; The Philanthropy Lab 2015).

In the remainder of this section, we provide a review of the goals of experiential philanthropy, various approaches to the implementation of experiential philanthropy initiatives, and empirical evidence on the effectiveness of experiential philanthropy as a pedagogic strategy within higher education.

## Goals of Experiential Philanthropy

Similar to service-learning, many of the goals associated with experiential philanthropy relate to enhancing student learning outcomes and meeting community needs. However, experiential philanthropy differs from service-learning in that it may or may not involve an organized service component. In fact, unlike service-learning, experiential philanthropy is not intended to create greater service opportunities for students; it is intended to provide students with the opportunity to understand nonprofit management challenges and then assume the role of a philanthropic funding agent on behalf of their local community (Ahmed and Olberding 2007). Thus, experiential philanthropy is designed to teach students not only about abstract issues relating to nonprofit organizations and social issues but also about actual philanthropic decision-making processes. Not surprisingly, then, one of the most important goals of experiential philanthropy has been the cultivation of the next generation of philanthropists.

## Different Pedagogical Approaches to Experiential Philanthropy

Experiential philanthropy can be implemented in several ways – however, two approaches have traditionally been most utilized: *the direct approach* and *the indirect approach*. The original approach, which is the direct approach, allows students an opportunity to engage in "direct giving." That is, this approach allows students to directly award funding to a nonprofit organization that they select. Students taking a course using this approach to experiential philanthropy are considered to be the direct, and final, decision-makers of the funding awards.

In addition to the direct-giving approach, students can also act as indirect decision-makers in experiential philanthropy initiatives. With the indirect approach, instead of students awarding funds directly to nonprofit organizations, students are able to review and provide recommendations of grant proposals on behalf of a funding agency. The recommendations provided by the students are then taken into consideration in funding allocations; however, the agency is the ultimate funding decision-maker – not the students as in the direct approach. An advantage of the indirect giving approach is that, unlike the direct approach, instructors do not have to secure funding in order to engage in experiential philanthropy. However, securing relationships with funding agencies willing to allow students' access to grant proposals can still present challenges.

In general, both the direct and indirect approaches to experiential philanthropy reflect the essence of service-learning, which is to combine classroom knowledge with practical experience. In both approaches, students are expected to develop an understanding of social and community issues. Students are also expected to better understand nonprofit management challenges and the complexities of acquiring resources in the nonprofit sector.

## Effectiveness of Experiential Philanthropy

Since the fundamental question to be asked of any educational program or initiative is "how are students affected?," it is important to understand whether experiential philanthropy (as with service-learning more generally) actually impacts student learning.

**Enhancing academic and civic outcomes.** Research on experiential philanthropy has shown that this type of service-learning pedagogy has largely positive effects in the classroom. One of the first studies to assess the effectiveness of

experiential philanthropy relied on students' self-description of their experience participating in an experiential philanthropy course. Specifically, Renee Irvin (2005) used a case study approach to examine students' views about their direct-giving experiential philanthropy project at the University of Oregon. The findings from this study indicated that after the experiential philanthropy project, students expressed an increased desire to get involved in volunteer and civic engagement activities in their community (Irvin 2005).

Ahmed and Olberding (2007) analyzed data from nearly 1000 university students who participated in an experiential philanthropy course and found that the majority believed that the course made them more aware of social problems and nonprofit organizations, increased their sense of responsibility to help others in need, and enhanced their intentions to give money and time to charity. In addition, Olberding (2009) found that students participating in an experiential philanthropy course reported enhanced understanding of course material.

The positive effects of experiential philanthropy have also been supported by recent quasi-experimental research. McDonald and Olberding (2012) in their quasi-experimental study of university students compared pre- and post-course evaluations from students who participated in an experiential philanthropy course with those who did not. Their findings indicated that similar to past research, at the end of the semester, students who participated in a course with an experiential philanthropy component were more aware of social problems and nonprofit organizations. These students also had stronger future intentions to participate in community service activities. These findings were also supported by qualitative data from their study.

Finally, a recent report by scholars at Brandeis University (2014) examined the effectiveness of several experiential philanthropy initiatives across the USA. In this report, these scholars found that students, regardless of university affiliation, gained greater philanthropic knowledge and skills through after their participation in an experiential philanthropy course (Benenson et al. 2014).

**Which types of students benefit most from experiential philanthropy?** Though experiential philanthropy has been shown to be a highly effective pedagogy, there is some evidence indicating that the positive effects of experiential philanthropy may differ by types of students. Ahmed and Olberding (2007), for instance, examined the experiences of students who participated in an experiential philanthropy course across majors and found that those majoring in the humanities and professional fields were more likely to indicate that the experiential philanthropy component of the course had no effect on their awareness of social problems and nonprofit organizations. These students were also more likely to indicate that the course had no effect on their belief in the value of experiential philanthropy or on their future intentions to become philanthropically involved in their communities. More recently, research has shown that certain types of students (such as females, older – in other words, non-traditional age – students, and students from helping profession majors) tend to report the most positive effects of experiential philanthropy (McDougle et al. 2017).

**Long-term effects.** A small handful of studies have shown that there are long-term effects associated with experiential philanthropy (Olberding and Hacker 2016). For instance, Ahmed and Olberding (2007) found that in 3- to 5-year follow-up surveys of students enrolled in a class with an experiential philanthropy component, nearly 86% of students indicated that they believed the class helped them to realize that they could make a difference in society and that they had a greater sense of personal responsibility in their community.

## Lessons from Nonprofit Management Education: Experiential Philanthropy as a Pedagogic Approach to Public Administration and Public Policy Education

Although experiential philanthropy has primarily been used as a way to teach principles of nonprofit management, the findings from the research on

experiential philanthropy indicate that the approach could be implemented more broadly – particularly, within public administration and public policy education. Indeed, given that concerns about the social roles and responsibilities of higher education institutions have increasingly been on the rise (for a review, see Bryer 2014), complex societal challenges such as poverty, social inequality, environmental degradation, economic injustice, and human rights abuses have placed enormous expectations on colleges and universities to produce graduates who will not only have learned about these challenges but will also be able to help in solving many of them. As such, a number of schools of public administration and public policy have begun investing significant resources not only into educating and preparing students for professional careers but also into educating and preparing students to become civically engaged citizens – citizens who will ultimately be motivated to get involved in their local communities.

Given that experiential philanthropy combines classroom knowledge with real-world decision-making, this type of instruction can provide students of public administration and public policy with a better understanding of social issues in the public sphere. Given the interconnected nature of government and the nonprofit sector in addressing many of today's most pressing social issues, it will become increasingly more important for students of public administration and public policy to have greater knowledge of the challenges of managing nonprofit organizations.

More importantly, given the purpose of experiential philanthropy (not only to enhance the grant-making skills of students but also to cultivate future philanthropists who are committed to solving social problems), experiential philanthropy will likely provide students of public administration and public policy with an opportunity to demonstrate innovative problem-solving skills. Similar to service-learning, experiential philanthropy focuses on connecting students to communities, and the value of the pedagogy is reflected in the beneficial impacts that studies have shown that it has across many disciplines. As such, by incorporating experiential philanthropy into the curriculum of public administration and public policy education, students should be well equipped to identify pressing social needs in their communities and make strategic philanthropic contributions toward addressing those needs.

In the end, experiential philanthropy can provide students of public administration and public policy with greater knowledge of, and exposure to, issues beyond the traditional classroom setting – and at times even beyond students' own life experiences. This exposure can help these students to make important linkages between theory and practice, which can be particularly useful given that public managers must often be able to identify pressing community challenges, carefully weigh the available evidence, communicate findings to varied stakeholders, and successfully implement equitable solutions.

Moreover, given the pervasiveness of social problems, both domestically and abroad, this pedagogy could be used as a way to gain greater understanding of how philanthropy-based education can be used to address social problems across the globe. According to a recent report on philanthropy education in Europe, experiential philanthropy would be welcomed as an innovative approach to teaching about philanthropy and philanthropic responses to social issues in the country, but there is skepticism about the fundability of the pedagogy (Keidan et al. 2014).

## Conclusion

Experiential philanthropy is an innovative educational approach for future nonprofit managers, philanthropists, and students of public administration and public policy. Indeed, by incorporating traditional classroom experiences with practical philanthropic investment and decision-making, students are encouraged to carefully consider how they go about solving social problems in their communities; and research has shown that this is an effective way to increase student learning and long-term civic interest.

# Exploring the Nexus Between Inflation Expectations, LIBOR, and Coinbase Index

Suwastika Naidu, Arvind Patel, Anand Chand and Atishwar Pandaram
The University of the South Pacific,
Suva, Fiji Islands

## Synonyms

Coinbase Index; Inflation expectations; LIBOR; Long-run effects; Short-run effects

## Definitions

Coinbase Index (CBI): This index tracks the performance of the digital assets listed by Coinbase, which is weighted by the market capitalization.

One-month London Interbank Offered Rate (LIBOR): The London Interbank Offered Rate is the average interest rate at which the large banks borrow money from other banks in the London market. It is also used as a proxy for the short-term interest rate.

Five-year inflation expectations (FYIE): Measures the expected inflation for the 5-year period that starts from today.

## Introduction

A number of international financial institutions, particularly the European Central Bank (2012), have emphasized that investment in cryptocurrencies is sustainable as it does not stimulate financial instability. Some of the common reasons why cryptocurrencies do not stimulate financial instability are as follows (Corbet et al. 2018): (1) lack of connection to the economy, (2) lack of acceptance, and (3) low volume of currency trading. However, recently with a massive growth of investment in the cryptocurrency markets, the global financial working group is only monitoring how the growth of investment in cryptocurrencies can stimulate financial instability. The Coinbase Index is a broad measure that captures the block position as it incorporates the weighted average of the listed digital assets being traded in the USA (Coinbase Incorporation 2019).

Moreover, this index is affected by changes in inflation expectations and LIBOR due to three reasons. First, investors will compare their returns on digital currencies and financial products offered to customers in the financial markets. With the growing investment in blockchain currencies, it is indicative that digital currencies are gaining investor confidence (Corbet et al. 2018). Second, LIBOR influences the interest rate on financial products provided by the banks and non-bank financial institutions. If the interest rate decreases for competing investments, it is likely that investors will invest in cryptocurrencies as compared to competing investments (Corbet et al. 2018). Third, if inflation is expected to increase, interest rates will also increase, and this will have an impact on the investment in digital currencies (Corbet et al. 2018).

This paper seeks to investigate the relationship between LIBOR, FYIE, CBI, and CBI returns. Specifically, this paper embarks by determining the volatility relationship in the LIBOR, FYIE, CBI, and CBI returns model. Finally, the Granger causality test is employed to determine bivariate causality between LIBOR, FYIE, CBI, and CBI returns. To date, none of the existing studies have explored the relationship between LIBOR, FYIE, CBI, and CBI returns. There are a handful of studies that have explored the behavior of digital currencies and how investors respond to volatility in digital currencies (Corbet et al. 2018). This paper undertakes a stern effort by exploring the impact of LIBOR and FYIE on the CBI and CBI returns. Figure 1 shows that after the year 2017, there has been a sharp growth in the CBI, with

**Exploring the Nexus Between Inflation Expectations, LIBOR, and Coinbase Index, Fig. 1** Coinbase Index, LIBOR, and FYIE. (Source: Developed by the author by using the EViews 8 software (2019))

LIBOR increasing and FYIE following a positive and negative cyclical pattern, thus implying that the investor confidence in the digital currencies has greatly increased. Figure 2 shows that FYIE is more volatile than CBI and LIBOR. This paper is divided into five sections. Section "Data and Research Design" outlines the data collection and research design. Sections "Empirical Results and Discussions" and "Discussions" present the empirical results and discussions. Section "Conclusion" presents the conclusion.

## Data and Research Design

### Testing the Relationship Between Inflation Expectations, LIBOR, and Coinbase Index

Investment is a complex and dynamic phenomenon that is driven by changes in human behavior. As the global society is moving toward the digital economy, investors have also started investing in digital assets. There are a number of advantages of investing in digital assets (Zhu and Zhou 2016; Crosby et al. 2016; Morabito 2017; Mainelli and Milne 2016). First, a number of studies have confirmed that digital assets provide approximately two digit returns every month. Second, digital assets provide a pessimistic stream of income and allow investors superior control over return on investment. Third, investing in digital assets implies that there will be a lower overhead cost. The costs associated with rent, electricity, and physical facility maintenance are eliminated when we invest in digital assets.

Undoubtedly, the investment in digital assets has grown significantly in the last 5 years. A close synthesis of existing literature confirms that studies on the blockchain market have started emerging in the top tier journals (Dyhrberg 2016a, b; Baur et al. 2018; Giudici and Abu-Hashish 2018; Smales 2018). Dyhrberg (2016a) noted asymmetric GARCH phenomena in the Bitcoin model to manage risk in the blockchain market. Expanding her previous study, Dyhrberg (2016b) confirmed that Bitcoin has the same hedging capabilities as gold. Baur et al. (2018) confirmed that Bitcoin demonstrates different volatility as compared to gold and other financial assets. Giudici and Abu-Hashish (2018) argued that Bitcoin prices are interconnected with other trading exchange prices. Smales (2018) found that Bitcoin prices are more volatile than other exchange commodities. This study contributes to the existing literature in two ways. First, most of the existing studies on blockchain market have compared the volatility of the cryptocurrencies with other

**Exploring the Nexus Between Inflation Expectations, LIBOR, and Coinbase Index, Fig. 2** Short-run changes in Coinbase Index, LIBOR, and FYIE. (Source: Developed by the author by using the EViews 8 software (2019))

financial assets. None of the existing studies have captured the drivers of volatility in the digital assets index. This study expands the literature by exploring how LIBOR and inflation expectations affect volatility in CBI and CBI returns. Second, this study also explains the impact of positive and negative shocks on CBI and CBI returns. None of the existing studies have captured this phenomenon on the digital assets.

## Data

The data for this study was extracted from the FRED economic database (FED). Table 1 provides the details of the variables used in this study. All the variables were converted into the log form before the analysis was conducted.

## ARCH Heteroskedasticity Test

The rationale for using this test is to determine the volatility in the time series data as the volatility in the residuals of the long-run model is related to the most recent residuals. The ARCH heteroskedasticity test helps us to determine whether volatility is present in the time series data and the possibility of conducting the GARCH/TGARCH and EGARCH models to capture the volatility in the time series data (Guirguis 2018).

## GARCH/TGARCH and EGARCH

The ARCH family models are based on two specifications, and these specifications are as follows: (1) conditional mean equation for conditional variance and (2) conditional mean equation for conditional error distribution. A GARCH (1,1) specification used in this paper is as follows (Katsiampa 2018; Ulusoy and Onbirler 2017):

$$CBI_t = X_t^{\prime\gamma} + \varepsilon_t \quad (1)$$

$$\vartheta_t^2 = \tau + \beta\epsilon_{t-1}^2 + \beta\vartheta_{t-1}^2 \quad (2)$$

Equation 1 captures the mean equation and Eq. 2 captures the variance equation. In Eqs. 1 and 2, τ is the constant term, $\epsilon_{t-1}^2$ captures the news about the volatility in the previous period, and $\vartheta_{t-1}^2$ is the GARCH term.

## Short-Run and Long-Run Model

The short-run and long-run models used in this paper for estimation are captured in Eqs. 3 and 4. The long-run model is specified as follows (Naidu 2017):

$$CBI_t = \beta_0 + \beta_1 FYIE_t + \beta_1 LIBOR_t + \in_t \quad (3)$$

The short-run model is specified as follows:

$$CBIR_t = \beta_0 + \beta_1 \Delta FYIE_t + \beta_1 \Delta LIBOR_t + \in_t \quad (4)$$

In Eqs. 3 and 4, $CBI_t$ and $CBIR_t$ represent Coinbase Index and Coinbase Index returns, $\beta_0$ is constant, $\Delta FYIE_t$ is change in FIYE, $\Delta LIBOR_t$ is the change in LIBOR, and $\in_t$ is the error term.

**Exploring the Nexus Between Inflation Expectations, LIBOR, and Coinbase Index, Table 1** Details on financial variables used in this study

| No. | Variable name | Period | Data definitions |
|---|---|---|---|

### Pairwise Granger Causality Test

The bivariate regressions that capture the pairwise Granger causality test are specified as follows (Balboa et al. 2015; Farooq and Hamouda 2016):

$$\mathrm{CBI_t} = \beta_0 + \vartheta_1 CBI_{t-1} + \ldots + \vartheta_1 CBI_{t-l} + \vartheta_1 LIBOR_{t-l} + \ldots + \vartheta_1 LIBOR_{-l} + \in_t \quad (5)$$

$$\mathrm{LIBOR_t} = \beta_0 + \vartheta_1 LIBOR_{t-1} + \ldots + \vartheta_1 LIBOR_{t-l} + \vartheta_1 CBI_{t-l} + \ldots + \vartheta_1 CBI_{-l} + \in_t \quad (6)$$

$$\mathrm{FYIE_t} = \beta_0 + \vartheta_1 FYIE_{t-1} + \ldots + \vartheta_1 FYIE_{t-l} + \vartheta_1 LIBOR_{t-l} + \ldots + \vartheta_1 LIBOR_{-l} + \in_t \quad (7)$$

$$\mathrm{LIBOR_t} = \beta_0 + \vartheta_1 LIBOR_{t-1} + \ldots + \vartheta_1 LIBOR_{t-l} + \vartheta_1 FYIE_{t-l} + \ldots + \vartheta_1 FYIE_{-l} + \in_t \quad (8)$$

$$\mathrm{CBI_t} = \beta_0 + \vartheta_1 CBI_{t-1} + \ldots + \vartheta_1 CBI_{t-l} + \vartheta_1 FYIE_{t-l} + \ldots + \vartheta_1 FYIE_{-l} + \in_t \quad (9)$$

$$\mathrm{FYIE_t} = \beta_0 + \vartheta_1 FYIE_{t-1} + \ldots + \vartheta_1 FYIE_{t-l} + \vartheta_1 CBI_{t-l} + \ldots + \vartheta_1 CBI_{-l} + \in_t \quad (10)$$

The Granger causality test reports the F-statistics for the possible pairs of (x, y) series which is captured in Eqs. 5, 6, 7, 8, 9, and 10.

## Empirical Results and Discussions

Figure 3 shows that from the year 2015 to 2016, a positive and negative cyclical pattern was noted for the volatility in residuals, which moved around an average of 0.5 and −0.5. Two positive peaks were noticed between the year 2015 and 2016. The first positive peak was few decimal places above 0.5, and the second positive peak was noted during January 2016. Negative volatility effects were recorded between the periods 2016 and 2017. The negative volatility effects reached its negative peak of −0.1 between July and October. The model recorded positive

Source: Created by authors by using Eviews8 software (2019).

**Exploring the Nexus Between Inflation Expectations, LIBOR, and Coinbase Index, Fig. 3** Volatility of inflation expectations, LIBOR, and Coinbase Index. (Source: Created by authors by using EViews 8 software (2019))

volatility effects from November 2016 to January 2018 and negative volatility effects from 2018 to 2019.

Additionally, the results of the autoregressive conditional heteroscedastic (ARCH) test show that the null hypothesis of no ARCH effect is rejected at 1% level of significance. In other words, we can run the GARCH/TGARCH and EGARCH models to estimate the relationship between FYIE, LIBOR, and CBI (Table 2).

The summary statistics indicate that there is large difference between the maximum and minimum values of the CBI. The difference is around 8044.30142 for CBI, and this difference is insignificant for LIBOR (2.356) and FYIE (1.21). The skewness of LIBOR and CBI is positive as compared to FYIE, which is negative. The kurtosis values indicate that our sample has positive excess kurtosis, as all the kurtosis values are close to or more than 2 (Gujarati and Porter 2010) (Table 3).

Table 4 captures the results of the GARCH/TGARCH and EGARCH models. Specifically, coefficient 3 in the EGARCH shows that there is a negative and statically significant level of last period or short period volatility in the model. In the long run, volatility in the LIBOR and FYIE has a positive and statistically significant impact on CBI and CBI returns. The magnitude of the coefficients indicates that CBI returns are greatly affected by volatility in the LIBOR and FYIE as compared to CBI. Coefficient 5 indicates that negative shocks in the model have a greater impact on volatility in CBI and CBI returns as compared to positive shocks of the same intensity. This clearly indicates that negative news that drives inflation expectations and LIBOR will have greater impact on volatility of CBI and CBI returns. Therefore, it can be concluded from our model that we have an asymmetric volatility spillover effect. The GARCH coefficients are negative for both CBI and CBI returns. The impact of FYIE volatility is highest on CBI returns as compared to CBI. In comparison with the EGARCH model, the GARCH/TGARCH model recorded a positive and highest constant in the volatility equation. This indicates that CBI exhibits very different volatility processes in comparison with CBI returns. Similar to the EGARCH model, the asymmetric GARCH term is negative and statistically significant which indicates that negative shocks have greater impact on volatility of CBI and CBI returns as compared to positive shocks of the same intensity.

E

positive and statistically significant for CBI and CBI returns. In the long run, 1% increase in LIBOR will increase CBI by 1.46%, at 1% level of significance. Similarly, 1% increase in LIBOR will increase CBI returns by 1.85%, at 1% level of significance. A 1% increase in FYIE will increase CBI by 1.68%, and a 1% increase in FYIE will increase CBI returns by 2.24%, at 1% level of significance. The $R^2$ and adjusted $R^2$ in both the models are more than 50%, thus indicating that our model is statistically robust.

Table 7 shows that the short-run impact of LIBOR and FYIE on CBI returns is positive and statistically significant at 1% level of significance. In the short run, a 1% change in LIBOR will change CBI returns by 1.76%. Furthermore, a 1% change in FYIE will change CBI returns by 2.089%. Our short-run model is robust as both the $R^2$ and adjusted $R^2$ values are more than 50%. The Breusch-Pagan-Godfrey heteroskedasticity test indicates that our short-run model is homoscedastic.

The pairwise Granger causality test indicates that there is no causality between LIBOR, CBI, and FYIE (see Table 8).

## Discussions

This study has empirically proved that negative shocks have greater impact on the volatility of CBI and CBI returns as compared to positive shocks of the same intensity. Negative news driving inflation expectations and LIBOR will shift investor confidence from physical assets to the blockchain market. The positive and statistically significant impact of FYIE on CBI returns indicates that investors are more likely to invest in the blockchain market if they believe that inflation will increase in the future (Zhu and Zhou 2016; Crosby et al. 2016; Morabito 2017; Mainelli and Milne 2016). There are a couple of reasons for this. First, to counter the negative repercussions of future inflation, current investments in the blockchain market will increase future cash flows that can be used to counter the negative impact of inflation on consumption. Second, an increase in forward inflation expectations will

**Exploring the Nexus Between Inflation Expectations, LIBOR, and Coinbase Index, Table 8** Pairwise Granger causality test

| Null hypothesis | F-statistic | Prob. |

encourage investors to invest in the blockchain market now as this will help them to smooth future consumption. The findings from the short-run and long-run impact of LIBOR and FYIE on CBI and CBI returns indicate that as LIBOR and FYIE increase, it is most likely that CBI and CBI returns will increase as investors choose to invest in assets that will maximize their financial returns.

## Conclusion

In summary, this study examined the relationship between inflation expectations, London Interbank Offered Rate (LIBOR), and Coinbase Index (CBI). The findings from this study confirm that there is a positive and statistically significant relationship between these three variables, both in the short run and long run. Due to the increase in investment in the blockchain market, some studies have argued that there is a need for more empirical work that captures the effect of volatile factors driving CBI (Corbet et al. 2018). This study takes a stern step by examining the common factors that might have an impact on the blockchain market. One of the main limitations of this study is that it is based on only two factors that may affect CBI. We need further studies that can capture the effect of similar volatile variables driving changes in the blockchain market.

# Exploring the St. Louis Regional Data Alliance (RDA): Understanding a Public, Community Data Platform

Sapna Varkey[1] and Paul Sorenson[2]
[1]Department of Political Science, University of Missouri-St. Louis, St. Louis, MO, USA
[2]St. Louis Regional Data Alliance, University of Missouri-St. Louis, St. Louis, MO, USA

## Synonyms

Community data; Data sharing; Public data

## Why Do Regions Need Public, Community Data?

Data and data analysis are a critical component in community development, and many localities are still figuring out how to use these components to promote equity and growth (Auerbach et al. 2017). Broadly, equity means providing different levels of support based on an individual's or group's needs in order to achieve fairness in outcomes (Kendi 2019). Working to achieve equity acknowledges unequal starting places and the need to correct the imbalance (Kendi 2019). Public, community data can help municipalities, nonprofits, and for-profit businesses understand their communities using shared data that helps them develop more equitable interventions.

Publicly available data can also play a role in improving health in communities. The term "health" means physical and mental health status and well-being (Braveman et al. 2017). Advancing health equity is a top priority for many local communities and, given its complexity, it requires intersectoral and multidisciplinary collaboration (Andruszkiewicz et al. 2019; Chircop et al. 2015; Fosse et al. 2018). The term "health equity" ultimately means that everyone has a fair and just opportunity to be as healthy as possible (Braveman et al. 2017). Achieving health equity requires removing obstacles to health, such as poverty, discrimination, and their consequences, including powerlessness and lack of access to good jobs with fair pay, quality education and housing, safe environments, and health care (Braveman et al. 2017). These realities make public, community data sharing necessary in eventually achieving health equity.

Considered together, social determinants of health (SDOH) create a gradient in health inequalities that reflects a relationship between social circumstance and health; there is evidence showing that as people move down the socioeconomic scale their health worsens (Fosse et al. 2018). This connection between social circumstance aligns with the notion of health equity being understood as a process, the process of reducing disparities in health and its determinants, and as an outcome, the end goal is the elimination of social disparities in health and its determinants (Braveman et al. 2017).

## What Can this Look like?

These intersectoral and multidisciplinary collaborations can look different in each local area, but at minimum they should incorporate connections with government and community (often nonprofit) organizations to identify ways to improve health outcomes for populations that experience marginalization through social and economic disadvantage (National Collaborating Centre for Determinants of Health 2013). It is often helpful to include non-health agencies, such as employment centers, housing supports, and police departments (Andruszkiewicz et al. 2019). These collaborators can help improve health outcomes at the community level and positively impact the social determinants of health (SDOH) (Robert Wood Johnson Foundation 2015; World Health Organization 2013).

Given the necessary collaboration among actors in the community, recognizing and managing potential cultures of competition among the organizations and agencies involved is critical. Community organizations often use data to support bids for funding, which can create a situation in which they must compete with complementary or similar organizations in their area

(Andruszkiewicz et al. 2019). Ultimately, a culture of competition could prevent community partners from necessary data sharing, which can hinder their ability to work toward the common goal of health equity (Andruszkiewicz et al. 2019). Furthermore, given how funding requirements often drive data collection, this environment of competition and fragmentation establishes technical hurdles alongside these collaborative barriers.

Often, there can be a culture of collaboration that already exists in a local area, which can help broker these intersectoral partnerships. The two fundamental steps in connecting organizations is creating a methodology for shared data collection across the region and a process for reporting (Arledge and Braasch 2020). This methodology for data collection would need to support high-quality data while also being user-friendly and affordable (Arledge and Braasch 2020) and the reporting would need to complement organizations' existing processes.

## Logistical Considerations

Electronic collection and information sharing about people's health information raises many important concerns, including but not limited to: data governance concerns, information security, organizational liability, and market competition among participating organizations. Data governance refers to the policies and practices established that dictate what data can be shared, with whom, under what conditions, and for what purposes (Allen et al. 2014). Actors engaged in data sharing believe that these policies must be built based on trust and a shared vision among stakeholders to overcome common barriers (Allen et al. 2014). This means governance and data sharing agreements need to be explicitly outlined for the collaborators and agreed upon (Allen et al. 2014). The governance approach should include methods for "acquiring, storing, aggregating, and de-identifying data" (Allen et al. 2014, p. 3). While many of these requirements are technical, data governance is largely anchored in trust and agreement across participating parties; a lack of trust is far more often the cause of a collaborative's failure than technical or logistical barriers.

## What Have Other Regions Done?

A growing community of practice has emerged to tackle these data sharing challenges throughout the United States. National efforts to coordinate and create data sharing infrastructure and skills, like the National Neighborhood Indicators Partnership (NNIP), can help communities use information to advance equity across neighborhoods. The NNIP is a learning network, coordinated by the Urban Institute, that connects independent, partner organizations in cities (NNIP 2021). These partner organizations have a shared goal of ensuring that all communities have access to data and the skills to use information to advance equity and improve conditions (NNIP 2021). NNIP serves its partners and their communities by strengthening local organizations' ability to expand the use of data; learning about innovative methods from each other and external sources, and elevating innovations from partners and communities to share them with local and national audiences (NNIP 2021).

One prominent example of a local data intermediary is the Western Pennsylvania Regional Data Center (WPRDC), which is managed by the University of Pittsburgh's Center for Urban and Social Research (UCSUR) in partnership with Allegheny County and the City of Pittsburgh. WPRDC created this shared technological and legal infrastructure in 2015, which supports research, analysis, decision making, and community engagement in the Pittsburgh region. This highlights the role of the WPRDC as a "data intermediary," which is designed to help people find information and use information in a way that helps them improve their communities (UCSUR 2017). They adopted the role as an intermediary after realizing that a lack of legal infrastructure; technologies that did not support the dissemination of raw data; incomplete data documentation; and a lack of capacity for managing information in a fragmented political environment were

inhibiting the broader use of data in the region (UCSUR 2017). Ultimately, WPRDC provides necessary infrastructure while institutionalizing the role of a data intermediary within a regional open data infrastructure (UCSUR 2017).

## What Is the St. Louis Regional Data Alliance?

Based on the work of the WPRDC and other NNIP partners across the country, including the Alamo Regional Data Alliance in San Antonio, the St. Louis Regional Data Alliance (RDA) formed its collaborative membership and governing body in 2018 – comprised of members from existing data anchors and stakeholders across local institutions (governments, funders, universities, nonprofits, etc.) and issues (health, economic development, education, etc.). The RDA was founded in recognition that good information – connected comprehensive datasets about the St. Louis region's health and well-being – is often hard to find. In many areas, the complex data landscape requires public, private, and social sector leaders to work together to create a holistic regional data sharing system to improve community health. In order to address these challenges, the RDA pursues a mission to build a shared data infrastructure and support strong data actors that use quality data to improve people's lives. The RDA does not intend to replace existing data efforts but will maximize their impact as they align and integrate with each other.

Since its launch in June 2018, the RDA has worked hard to address these challenges alongside a growing number of partner governments, universities, funders, nonprofits, healthcare providers, private businesses, and strategic initiatives. Collectively, these organizations sought to understand, connect, strengthen, and use what the RDA refers to as community data, defined as "organized information about community health and development — including but not limited to data from government, healthcare, and the nonprofit sector — that is used to understand a local situation and plan for action."

## Supporting Strong Data Actors

The Regional Data Alliance is led by its 19-member steering committee, which guides the implementation of the RDA's strategies, develops the RDA's long-term funding and sustainability model, and is the primary advocate for shared data infrastructure and data sharing/transparency in the St. Louis region. The steering committee represents the interests of RDA members and key St. Louis institutions, as well as evaluates and helps direct RDA backbone staffing and ensures the prominence of community voice and racial equity. While steering committee seats are for individuals, not organizations, organizational representation helps guide steering committee composition and representatives are expected to both represent their organization to the RDA and advocate for RDA priorities at their organization.

The RDA's broader membership – which stands at 350 individuals as of June 2021 – is comprised of a diverse data practitioners who work together to represent the variety of essential regional data skillsets and perspectives in the St. Louis region. Membership is free and open to anyone who is interested upon completion of a short form with their contact information, position, and role in the St. Louis data ecology. Members receive regular updates from the RDA highlighting data initiatives across the region, relevant trainings, and ways to connect to each other. They also convene at quarterly meetings to discuss such work in person (or on Zoom) and help inform key decisions of the RDA. Members ensure that key St. Louis institutions are represented in the RDA outside of the steering committee, as well as put continued focus on including community voice and a racial equity lens in the RDA's development.

## Building Shared Data Infrastructure

The Regional Data Alliance is supported by the University of Missouri – St. Louis' Community Innovation and Action Center (CIAC), similar to how the WPRDC is housed at the University of Pittsburgh. The RDA's Director also serves as a

co-director of CIAC, with additional staff serving in roles such as data scientist, community manager, data manager, technology support, and graduate assistants. In addition to convening the RDA membership and steering committee, RDA staff also implement a variety of data infrastructure efforts designed to fill in critical gaps in the regional data ecosystem.

Some of these efforts cut across the RDA's focus areas, including its focus on qualitative data connectivity, measuring progress toward racial equity, institutional data assessments, and the Regional Data Exchange (RDX), found at rdx.stldata.org. The RDX is a tangible example of what shared data infrastructure can look like: it collects 420 datasets from 8 local governments into one open-sourced platform (built on the DKAN infrastructure) that can be accessed by a variety of government, academic, and community-based partners looking for local data. The RDA is exploring back-end connections to government data platforms for ease of publication and upkeep (similar to WPRDC), though its current iteration nonetheless stands as a substantial step forward in bringing local data into a common framework.

Its additional data infrastructure initiatives center around four key sectors (see Fig. 1). In Community Development – which includes local governments, regional planning bodies, and place-based initiatives – the RDA is expanding upon the RDX, data analysis, and data standardization efforts to bolster housing access and data transparency initiatives. In public health, the RDA is partnering with local universities to measure health outcomes at more fine-grained levels, as opposed to the county or zip code. This would allow researchers, health systems, and policy makers to make more informed decisions and would allow stakeholders to assess whether interventions to increase health or social equity result in population health changes .

In social services, the RDA, in conjunction with a variety of partners including United Way 2-1-1 and the St. Louis Integrated Health Network, is working to developing the St. Louis Community Information Exchange (CIE) to share information and coordinate efforts to maximize resources in the delivery of holistic, person-centered care in the St. Louis region (Sorenson et al. 2021). The CIE was inspired by a model in San Diego and represents a collaborative, multi-stakeholder initiative that allows for sharing client data between organizations for "closed loop referrals" and aggregates information that can address and combat systemic health disparities. Finally, in education, the RDA is working to support data development efforts for a local research practice partnership comprised of local school districts, universities, charter schools, and support organizations – including the exploration of adopting emerging data standards (like Ed-Fi) to fill in gaps in state reporting data.

**Exploring the St. Louis Regional Data Alliance (RDA): Understanding a Public, Community Data Platform, Fig. 1** RDA focus areas

## Lessons for Data Sharing Initiatives

The St. Louis Regional Data Alliance is a relatively new initiative, but its work to date highlights key considerations for other regions looking to start or expand collaborative data sharing initiatives. The first is that place-based efforts are best positioned to align data across sectors for community health purposes – because healthcare, social service, community development, and education data all fall under similar funding and policy landscapes, it is easier to make deeper cross-comparisons across issues instead focusing on a single domain (like housing) across the country. The second – and arguably most important – is that a focus on data infrastructure and analysis alone is not enough. The RDA's role as a collaborative body that brings many stakeholders together creates the conditions for data sharing based on trust and a shared agenda. Without this key component, most technical aspects of data infrastructure are woefully underutilized – and therefore do not help promote equitable outcomes in the community.

# External Budgetary Auditing

Andreas Glöckner
Unit III 3, Hessian Court of Auditors, Darmstadt, Hesse, Germany

## Synonyms

External budgetary audit; External compliance and performance audit; External control

## Definition

External budgetary auditing is part of the budgetary circle. It encompasses compliance and performance audit tasks. Managers of public money (such as public fund holders) are accountable to the citizens and their elected representatives not only ex ante (for their planning) but also ex post (for the results of their activities). There is a need to control if they have properly managed public financial resources and if they have done what they have announced before. Democratic control and scrutiny is a public good: it is in favor of all citizens, there is no rivalry in consumption, and nobody can be excluded from. The existence of an external audit and the way it is performed are major indicators of the development of democracy in a society in general. In order to ensure that the audits are performed free from any kind of undue influence, the audit institution needs the status of autonomy, the institutional guarantee of its existence (including the freedom from repression), and full authority and independence in performing the audit.

## Introduction

There are public sector special types of capital inflows in public sector entities that have no or no full direct service in return (not necessarily existing reciprocity of money paid and values/services received in exchange). The managers of public funds have to report how they used these resources entrusted to them (*stewardship function*). This is because the contributors of the funds and their representatives have the right to know what the resources are used for and if they have been spent in accordance with law and regulations, including the economic principle and claims for efficiency and effectiveness. If the raising and spending of public money is only internally controlled (by non-independent subunits of the audited institution), there is a lack of neutrality, objectivity, and reliability. Therefore, external institutions are needed which evaluate how public financial resources are raised and spent. The entry explains the institutional background of external budgetary auditing, the role and results of audits within the budgetary circle, and the two different kinds of budgetary audits. Furthermore, it states the importance of the externally performed audits (in contrast to internal control measures) and explains that they have to comply with specific public sector requirements. The entry covers External Budgetary Auditing in general. However, the institutional setting differs according to country and government level.

## Institutional Background: The Relationship Between the Powers

The stakeholders of Public Sector Accounting in a broader sense (including the three interconnected subdisciplines budgeting, accounting, and auditing) are determined according to the specific legal-socioeconomic-political environment. In a parliamentarian democracy, agency theory (Jensen and Meckling 1976), and therefore the *principal-agent model* applies: there is a separation of pseudo-ownership and de facto decision power and control also in the public sector (Fama and Jensen 1983). "The heart of the public sector is the sovereignty of governments ultimately controlled by politicians" (Jones and Pendlebury 2010, p. 2). Provided this context, the citizens (the principal) delegate political power via elections to some politicians (the agent) for a certain period of time. The individual politicians organize themselves and their work within political parties. As a result, at central and – if existent – at state level, the government (executive power) is established according to the majorities of votes within the parliament (deliberative/legislative power). In entities with more than two parties and if there is no party holding more than 50% of the votes, negotiations start in order to determine a majority of votes in the elected assembly of representatives of the citizens (parliament) and to form both future government and opposition. Depending on the institutional setting (here especially the autonomy status of the municipalities), it is possible that comparable relationships and conditions also exist at local level (local council). The necessary condition is that municipalities

have the right to local self-government. In general, the appointment of politicians who work on behalf of their electorate is the same across all existent levels of government in democratic societies. It is important that also when the legislative period is in progress, the government or local equivalent depends on the support of the majority in the parliament or local council representing the citizens. One major example for this is the budgetary process.

## The Functions of Budgets: Steering and (Ex Ante Control for) Approval

### The Steering Function

A *budget* is a financial plan, which in the public sector – regardless the levels of government – is formulated by the executive unit (government or head(s) of local administration, such as the mayor). Thus, it is a *steering tool*: the existence of a budget obliges public sector decision makers to plan and steer the future of the entity in a structured, comprehensive, and coordinated way. It represents the political measures, which the government/head(s) of local public sector administration strive(s) for, expressed in monetary terms (estimated cash and/or accrual numbers). More specifically, a budget governs that public sector resources are levied (taxes, tariffs, charges, fees, and contributions), allocated (service production), and distributed (transfers, such as social assistance or subsidies). Sometimes there are also budgets specifying the quantities and qualities of public sector services ("products") that should be provided to the citizens and their intended outcome or impact ("product or performance budgets"). In case of misjudgments by the preparer (s) of the budgets (excessive expenditures) or new developments (non-scheduled expenditures), there might be the need of supplementary budgets.

There are different ways how public managers are involved in formulating the budget (e.g., top-down vs. bottom-up budgeting) and methods how to prepare the budgets (e.g., "incremental budgeting", "zero-based budgeting", "planning programming budgeting", "performance-based budgeting", and "accrual-based budgeting"; Jones 2002, pp. 5457–5459; Budding and Grossi 2015, pp. 125–134).

The formulation and thus the information quality of budgets are guided by fundamental budgetary principles that can be found either as part of the national/regional constitutions or specific budgetary or financial laws and regulations. In order to reduce annual parliamentary pressure and incentives on maximizing budget spending in electorates, there are additional constitutional and legal constraints which limit the decisions on the budgets in most countries (Lienert 2013, pp. 118–119). This is because budgets should cover the financial requirements of a public sector institution or organization – but not more than that. Contrary to that, there is a permanent temptation of decision makers to go into debt. The reason for this is to gain nonexisting resources that are deemed necessary for current politics, at the expense of future generations. This is a kind of "borrowing against future," which is a decision with binding legal and financial consequences for future generations of decision makers, and therefore conflicts with the idea of democracy and the moral-ethical principle of intergenerational fairness (also called "the concept of intergenerational or interperiod fiscal equity"; Chan and Xu 2013, p. 773).

### The Approval Function – Ex Ante Control

According to the separation of powers described above, the budget has to be presented to and approved by the deliberative power (legislative power at central and states level or local council at municipal level). Consequently, a budget is also a major *instrument of control*. By presenting the budget, the government/head(s) of local administration require(s) approval (in the form of a budgetary law or act). The counterpart of the governmental "monopoly of initiative" to formulate the financial plan is the parliamentary right to finally decide on it (Droege 2015, p. 943). In general, the budgetary power – the right of final decision on the financial measures and, by doing so, on the entire government/municipal activities – is one of the most important and central privileges of an elected representation of the citizens and a core asset of a democracy. In fact, who decides on

the spending of public funds has the ultimate power to decide. To conclude, by approving the budget for the coming fiscal year(s), the parliament/local council also agrees on the political measures of the government/head(s) of local administration for the aforementioned period of time, declares its confidence with their planning, and authorizes the public administration officers to execute these plans. Because of this, the parliamentary discussions about budgets are often perceived as the central debates in a legislative period.

However, there are differences in the countries how the elected representatives are involved in the budget process, depending on the political system (e.g., the OECD survey 2014). On the one hand, in countries with a Westminster system, the elected representatives face rather strong amendment restrictions. On the other hand, there is a form of presidential system characterized by a strong separation between legislative and executive powers combined with unrestrained parliamentary budget amendment authority. In general, other democratic political systems are in between these two extremes in terms of parliamentary budgetary power. "[P]arliamentary budgetary powers are particularly strong when political separation is accompanied by unlimited budget amendment authority by parliament" (Lienert 2013, p. 117).

In short, ex ante control by the deliberative/legislative power or its municipal equivalent comprises to assess the setting of priorities regarding political measures in a prudent, reliable, and thorough way, also in comparison with the related costs. Internationally less often, there is also an ex ante audit of the budgets regarding its plausibility and legality by external audit institutions on behalf of the deliberative/legislative power or the municipal equivalent (Shand 2013, p. 822).

### Finding Compromises in Situations of Conflicting Interests

The future orientation of the budgetary plans is also the reason why both politicians and the public are normally more interested in the ex ante budgets than in the ex post budgetary or financial reports. Both the authority to amend and approve budgets and the right to claim for information are the reasons of a never-ending dispute between the two democratic powers on central and state government level mentioned before. Sometimes this dispute is also subject of decision by the judiciary, here especially the high courts (e.g., Droege 2015). Similar disputes also appear between the local council consisting out of the elected representatives of the citizens (the local kind of deliberative power) and the local administration, as represented by the head(s) of public administration (mayor or equivalent, the local kind of executive). Since there are conflicting interests in politics, formulating the budgets is the playground of political compromises. In short, "many of the organizational benefits of budgeting come from the process of developing the budget, rather than from just having the written plan" (van der Stede 2005, p. 101). In the end, the budget finally agreed on is normally enacted by the elected representatives as an annual budgetary law (central or states level) or budgetary act/statute (local level).

## Characteristics of the Budgetary Process in the Public Sector: The Binding Effect and the Public Sphere

One might speak about a two-step delegation of budgetary power (or in other words: a stepwise principal-agent relationship) in the budgetary process. First, there is a delegation via elections from the citizens to the politicians, and second, there is a delegation from these elected politicians in the deliberative/legislative power or the local equivalent to those in the government/at the head of local administration and to public officials within the administration via budgetary approval. This means that the government/head(s) of local administration and the public administration receive legitimacy to set the political plans, at the same time also facing the duty to convert these plans that have been approved into reality. This is one of the differences in comparison with private sector budgets: the latter are nothing more than internal, non-binding management tools. In the public sector, there are different degrees of flexibility in executing the budgets, according to the respective country and government level. However, in general, the political goals and

measures that are agreed upon are *binding* for the public administration.

It is characteristic of good public governance that the planning process and its result (the budget) are *open to the public*, in order that the electorate and their representatives might control the doing of their agents. Therefore, budgets are also a kind of *communication tool*. In order to reach budgetary transparency, also the underlying political-socioeconomic assumptions need to be open to public (e.g., the tax estimations used).

## The Function of Budgetary Auditing: Ex Post Control

In the reverse perspective, the delegation of executive power and funds makes politicians accountable to the public about the decisions made and the spending of financial resources entrusted to them. "Audit is the modest price of limited liability" (Saw 2002, p. 309). In theory, public sector decision makers, basically politicians but also trust holders within the public administration, are expected not to act in their self-interest but as stewards of common interests within a community. The term that describes this relationship is *stewardship*. The core of this activity is to safeguard the entity's assets, fiscal sustainability, and the leeway of future decision makers. Consequently, after the end of each fiscal year, the institution that is executing the audit is looking for discrepancies between the numbers in the ex ante budget and the ex post budgetary reports, also including an investigation about fraud, irregularities, and the performance of the audited institution. Public sector managers and dignitaries must be held responsible for the results of their activities, and therefore are accountable to the people not only ex ante, on their planning, but also ex post, on their results and if they have done what they have announced before.

### Ex Post Control by the Citizens (and Weaknesses of This Approach)

Democratic control is a public good that is not restricted to the parliamentarians or elected representatives at local level but also comprises *direct democratic control*. This is when the executive power is controlled directly from the electorate (the citizens). However, there are potentially asymmetries of information, reasons of costs, restrictions of time, a lack of necessary preparatory training and knowledge in budgeting, accounting and auditing, and/or missing individual incentives. The latter is caused by the relative insignificance of the opinion of single citizens, unless they join forces and form political parties or interest groups. All those factors might work as a barrier, so that the individual principal does perhaps not make use of his/her right to directly control the budgetary performance of the respective public sector entity. In fact, from a truly practical point of view, a public sector entity's office would be much disrupted by each citizen individually checking the compliance and performance of the entity in the books and gathering the information about the past performance of the public sector entity.

### Ex Post Control by Public Sector Audit Institutions

This is why there is a need of "a professional auditor to verify the accounts and report to all users" (Saw 2002, p. 309). Thus, even more than in the private sector, there is a necessity of *legal control* – the checks and balances by public sector specific audit institutions. This is another delegation of a task (the control task) to an agent on behalf of and in favor of the citizens.

If the reporting entity is audited by an own subunit, it is called *internal audit*. Contrary to that, if the audit is done by another institution, this is called *external audit* (elements and fundamental principles of public sector auditing in general: INTOSAI, ISSAI 100). At the central or states level, this is the work of the Supreme Audit Institutions (SAI), such as either a Court of Auditors or an auditor-general (and his supporting office). These two SAI models show differences in the status the respective audit institution has in relation to the democratic powers and in the main intended addressee(s) of their reports (Shand 2013, pp. 822–823). Depending on the constitutional, fiscal, and political autonomy status of the municipalities, they might have municipal audit offices separate from the central state or regional ones. These offices perform their work

more or less independently from the local administration. Also for them it is a key issue that they are free from instructions by the audited unit and its head(s). Normally, external auditors make use of the work and results of the internal audit unit as starting point. In addition, the external auditors use the findings of the internal control system. A close cooperation between external and internal audit is essential (Shand 2013, p. 821) in order to ensure that irregular transactions, such as fraud, are observed not solely as part of an extraordinary external ex post audit by chance but on a regular basis, as part of everyday internal running processes.

Even though there are different institutional models of external auditing, the overall approach is similar: external public sector audit institutions examine the budgetary and financial reports either as technical experts on order of the parliaments/local councils or autonomously on their own decision. At central and states level, these audit institutions sometimes even have the freedom of judicial independence. They always perform the audit on behalf of the public that provided the resources spent (tax payers) and the legitimacy to do so (electorate). Within this institutional framework, SAIs are institutions *sui generis* (= of their own, particular kind) – they are not part of the legislative power or the judiciary, and they are also independent of the executive power (Engels 2002, col. 1978). The status of autonomy, the institutional guarantee of their existence, and the independence in performing the audit that external audit institutions have are major indicators of the development of democracy in a society. This independence includes the audit institution deciding free from external influences and fear of repression on what is audited and what is not. United Nations resolution 69/228 "[r]ecognizes that supreme audit institutions can accomplish their tasks objectively and effectively only if they are independent of the audited entity and are protected against outside influence" (United Nations – General Assembly 2014, para. 1). Their judgments need to be professional, objective, and free from bias or political interference. Moreover, it is an indispensable condition for performing audits that the external audit institutions have the right to request and access all information necessary in a timely manner, such as to examine the accounts and all related documents. They are also free to decide in which way and detail the audits are conducted (intense scrutiny of public and non-public documents, local investigations or commissioning of external experts). These institutions examine the budgetary and financial reports after the end of each fiscal year, also in comparison with the budgets. The degree of credibility of their work depends on the degree of independence and professional expertise which the audit tasks are performed with. The principles set out in the Mexico Declaration on Supreme Audit Institutions Independence of 2007 by the International Organisation of Supreme Audit Institutions (INTOSAI) contain all of those requirements concerning necessary conditions of external audit in general (Table 1).

Furthermore, it is important to point out that external audit never judges the political decisions on the provision of public services that the budget is based on. This is the central aspect of political neutrality of audits. In that sense, independence has two sides: it means that external audit institutions should be free of political interference, but on the other side they should also not interfere with politics.

**External Budgetary Auditing, Table 1** Mexico declaration on SAI independence – the eight principles

| | |
|---|---|
| 1. | The existence of an appropriate and effective constitutional/statutory/legal framework and of de facto application provisions of this framework |
| 2. | The independence of SAI heads and members (of collegial institutions), including security of tenure and legal immunity in the normal discharge of their duties |
| 3. | A sufficiently broad mandate and full discretion, in the discharge of SAI functions |
| 4. | Unrestricted access to information |
| 5. | The right and obligation to report on their work |
| 6. | The freedom to decide the content and timing of audit reports and to publish and disseminate them |
| 7. | The existence of effective follow-up mechanisms on SAI recommendations |
| 8. | Financial and managerial/administrative autonomy and the availability of appropriate human, material, and monetary resources |

## The Two Different Kinds of Budgetary Audits

External budgetary auditing could comprise two tasks: compliance and performance audit. Both kinds of audits complement each other.

- *Compliance audit* (INTOSAI: ISSAI 400) covers the question if the audited public sector entity meets all existing legal requirements, including the *budget and public sector accounting law* as well as other financial regulations and legislation, for example, financial regulations within the entity's constitution. Therefore, one could also refer to compliance audit as legality or regularity audit. This means that revenues and expenditures and/or cash inflows and outflows (or in other words, the "raising and spending of public funds") were examined as compliant with law and thus regular (Shand 2013, p. 818). A basic condition is that economic transactions and events must be properly recorded and processes must be adequate. In addition, the audit also needs to cover the question whether the information provided by the entity was sufficiently relevant and reliable. However, the core of external budgetary auditing is the target-actual comparison of the ex ante budgets and the ex post budgetary reports. The aim of this analysis of actual spending against the budget is to detect unauthorized deviation from original planning (excluding supplementary budgets) and from guidelines and rules. In other words, it is intended to evaluate accuracy and budgetary discipline. Amounts which were legally determined as due have to be actually received or paid, and services/performances that were agreed upon have to be rendered. In addition, the audit institutions need to verify the explanations of occurring deviations between target and actual results provided by the audited entity. "Comparisons of actual performance and targets can lead to an improved understanding of what is and what is not working well" (van der Stede 2005, p. 104). Therefore, the audit of the aforementioned assumptions and forecasts that the budget is based upon is also a central issue.
- *Performance audit* (INTOSAI: ISSAI 300, ISSAI 3000, and ISSAI 3100) is also called "value for money audit" (Öhman 2015, p. 166). It deals with the issue of whether expenditures are proportionate to the benefits in economic terms (appropriateness audit; Öhman 2015, p. 164) or, in other words, if the basic economic principle is respected. These are inevitable subsequent questions after discovering that there is a mismatch between actual performance and targets. The aim is to determine the reasons for adjustments and deviations. However, public sector performance is part of budgetary auditing only if public sector budgetary decision makers also deal with the output of the entity and its quality, such as in terms of obligatory product budgets. Traditionally, there is a way of *input control*. In this case, the budgetary legislator provides a limited amount of money that is dedicated to the provision of a particular public service. It is the aim of the administration to use the public funds at its disposal in the best economic way, providing the best quality and highest quantity of services possible (maximization principle). Alternatively, the economic principle could be interpreted in a different way. If the decision maker (the budgetary legislator/local council) is dealing with the quantitative and sometimes qualitative planning of products, there is also a way of *output/outcome control*. In this case, it is possible for the external auditors to determine if the given, budgeted public services could possibly have been rendered at a lower cost (minimum principle) (Engels 2002, col. 1981–1982). Another result of this audit is whether the inputs were actually necessary to achieve the output/outcome objectives set. Thus, it is the aim of the audits to ensure a sound management of financial resources that is in the best interest of the principal. For instance, there is the need to detect "budgetary slack". "Budgetary slack describes the practice of overestimating budgeted costs, or underestimating budgeted revenues, to make

budgetary targets more achievable" (Budding and Grossi 2015, p. 137; further information: van der Stede 2005, pp. 104–105). In general, within external budgetary auditing, performance audit focuses on the question what could have done better to avoid the deviations detected in the compliance audit. This is a traditional differentiation. One may also argue that compliance audit includes performance audit since claims for economy, efficiency and effectiveness have to be laid down in laws and regulations to make them obligatory to apply.

## The Result of Budgetary Audits: The Audit Reports

The result of these rational control activities are summarized in the *audit reports*. There are different kinds of reports (see, e.g., the Treaty on the Functioning of the European Union, here: section 7 on the European Court of Auditors, art. 287) that audit institutions usually draw up:

- Annual reports about the implementation of the budget;
- An annual certification or statement of assurance about the legality, the regularity, and the reliability of the financial statements and their underlying financial transactions;
- Special reports on maladministration, mismanagement, fraud observations, and other irregularities, including the advise how to prevent all of those, and specific assessments about all existing activities of the audited institution;
- Opinions at the request of one of the other democratic institutions.

The first report mentioned is the main product of an external budgetary audit. However, also the other kinds of reports can result out of such an audit.

It is a central audit principle of a state under the rule of law that the audited institution has the right to take a stand on the audit findings and observations ("*audiatur et altera pars*"). Its application prevents errors and material misrepresentation. The addressee(s) of the audit reports vary internationally – depending on the institutional setting of the audit institutions. In most countries the reports, once completed, are sent to the audited institution and to the parliament or the local council for information purposes. The key report that is sometimes also called "statement" or "opinion" is used as the basis of the budget any discharge procedure. Depending on the target user group, the aim of the reports, and regulatory restrictions, the report can also be published.

In an ideal world, the financial result of politics in the last year, that is presented in the annual budgetary reports, would be the basis of the planning of the following year(s). However, since the planning process has to take place some time in advance of the calendar year and both preparation and audit of the budgetary reports take some time after the end of the fiscal year, there is normally some kind of time gap. This is why the discharge decision by the parliament/local council is sometimes based on the budgetary report that refers to the year before the previous year. However, the larger the time gap between the fiscal year audited and the moment of conducting the audit, the lower the political meaning of the audit and the related discharge decision of the legislative power/local council. This is why timeliness is an important qualitative characteristic of useful audit information.

## Prosecutorial Versus Advisory Role of Audit Institutions

There are countries where external audit institutions also have a *prosecutorial role*, whereas in others they are neither entitled to impose sanctions nor do they have the authority to give administrative orders to the audited institutions (Shand 2013, p. 822). Normally, the reason for separating audit and prosecution is that there is the need of trust between auditor

and auditee while at the same time maintaining the independence of the two. In case that audits solely have an advisory role, their impact depends on audit findings that are convincing, neutral, evident, well founded, and often also open to public. In that sense, external audit provides the experts' assessments that might be used by the public or politicians as basis of political discussions.

In terms of budgetary audits, the findings are normally published and sent to the elected representatives of the citizens for being discussed, and as base for the discharge decision. The external audit institutions should support the political decision makers in the deliberative/legislative power in exercising their power of ex post control – in that way one may see an advisory role of the audit institutions. Due to the size of the reporting entity and the fact that not all parliamentarians/members of the local council might be involved in all affairs, the parliament/local council often has different committees dedicated to special functions or topics. Normally, there is also a special committee on budgetary control. The auditing institutions are reporting to this committee which is either pre-deciding on the annual decision on the discharge of the government (central and states level)/head (s) of administration (local level) or on the deferral of this decision. To sum up, the potential users of audit reports are political decision makers within the democratically elected bodies, the public and the information mediators (especially the media), and of course the public administrations themselves (for internal management reasons).

## Conclusions

The budgetary process is a circle (Fig. 1). First, there is the planning part that separates into the formulation of the budgets by the government/head(s) of local administration and their potential amendments and approval by the parliament/local council. Second, the public administration (with the government or head(s) of local administration at the top) is executing the plans. At the end of each fiscal year, the government/head(s) of local public administration report(s) to the parliament/local council in its budgetary reports about the past activities and financial performance. Third, at the end of the circle, there is the reporting-based monitoring and control process, including the parliamentarian right of control. Similar conditions usually apply to the local council or particular committees within.

Next, external public sector control institutions audit the financial reports either as technical experts on order of the parliaments/local councils or autonomously on their own decision, as part of the institutional setting. Especially the supreme audit institutions play an "important role (. . .) in promoting the efficiency, accountability, effectiveness and transparency of public administration" and in the "efficient and effective receipt and use of public resources for the benefit of citizens" (United Nations – General Assembly 2014, para. 2 and 3; also see INTOSAI, ISSAI 12). External budgetary auditing is part of the overall backward-looking control processes in the public sector that take place in order to ensure that the spending of public funds by the public sector administration meets legal requirements,

**External Budgetary Auditing, Fig. 1** The position of budgetary control in the budgetary circle

including the compliance with the economic principle. In particular, it is important that there are no major discrepancies between the actual spending and the budgetary planning, which was decided according to the will of the democratically legitimated decision makers. Politicians and public managers who are in the position of decision makers are held accountable for their management of the public funds, and external auditors play a central role in terms of accountability.

## Synonyms

Diagnostic strategy; Public sector reforms; Solomon Islands

## Definitions

| | |
|---|---|
| External forces | These are the external agents behind the public sector reforms. |
| Public sector reforms | These refer to the changes in the public sector structures and services to improve public service delivery. |

## Introduction

Public sector reforms are not a new phenomenon in the developed and developing countries. The reform trajectories, particularly in small island developing countries, have been significantly influenced by the New Public Management (NPM) model (Brinkerhoff and Brinkerhoff 2015). The public sector reforms in the developed and transition economies are driven mainly by the Organisation for Economic Co-operation and Development (OECD), and likewise, public sector reforms in the developing countries are mainly driven by the World Bank and International Monetary Fund (IMF) (Brinkerhoff and Brinkerhoff 2015). The wave of reforms initiated by the NPM model focuses on the neoliberal ideologies of aligning the public sector with the operations of the private sector (Van de Walle and Hammerschmid 2011). The intricacies of the management debate on the success and failure of public sector reforms have been closely scrutinized by academics, practitioners, and policy makers (Van de Walle and Hammerschmid 2011).

Moreover, there is a rich body of literature that tries to explore the effectiveness of reforms in both the developed and developing countries. The plight of the main drivers of public sector reforms, types of public sector reforms, and the positive and negative impacts of these reforms has been ignored by academics and policy makers in the Pacific Island countries. With the failure of reform efforts in many small island developing countries and the development of patronage state, it is crucial that light needs to be shed on the reasons of the failure of reforms in the small island developing countries (Rahman et al. 2013).

This research problem follows from the problem analysis mentioned above. It is imperative for the academic community to have knowledge and understanding on the reasons for failure of reforms in the small island developing countries. The main goal of this entry is to examine two key research questions. These two research questions are as follows: (1) "What are the major reforms in the public service of the Solomon Islands in the last 10 years?" (2) "Has the RAMSI machinery influential in the reforms that took place over the last 10 years?"

This entry is divided as follows. Section "Overview of the Public Sector Reforms in the Solomon Islands" presents the overview of the public sector reforms in the Solomon Islands. Section "Theoretical Perspectives Related to the Literature on Public Sector Reforms" reviews the existing literature. Section "Literature Review on Public Sector Reforms" presents the research methodology used to collect data for this entry. Section "Research Findings and Discussions" presents the research findings and discussions. Section "Theoretical Contributions of This Entry" presents the theoretical contributions of this entry. Section "Policy Implications of This Entry" presents the policy implications, and section "Conclusion" presents the conclusion and limitations for future research.

## Overview of the Public Sector Reforms in the Solomon Islands

The public sector reforms in the Solomon Islands can be traced back to the ethnic tensions of the early 2000s, when immediate help was needed by the Solomon Islands government to restore peace and harmony in the nation (AusAID 2013). The government of the Solomon Islands has followed the developed and developing countries while implementing public sector reforms in order to create an economically conducive private sector business environment that will increase foreign direct investment and foster economic growth (AusAID 2013).

*History of the Solomon Islands*: The Solomon Islands history is related to colonization and independence. During January 1942, Japanese forces had occupied the country and used Solomon Islands as a battlefield during World War II. Most of the fighting related to World War II occurred in the Solomon Islands for 3 years (LiPuma and Meltzoff 1990; Dureau 1998). With the establishment of the network of local councils of the British colonial administration, stability was reinstated in the colonial government's public service delivery. The political evolution of the Solomon Islands can be divided into two categories. The first period was from 1893 to 1960 which was the "stagnation period." During this period, the Solomon Islanders did not participate in the governance system. The second period was from 1960s onward, and during this period the Solomon Islanders could participate in the decision-making process (Nanau 2016). The traditional model of public administration was implemented by the British colonial administration during the 1960s via the legislative and executive councils. The official local councils during this period incentivized the locals to contribute and participate in the activities of the central government. The traditional model of public administration was further changed when the elections took place in the Solomon Islands in the year 1967 and immediately after which the constitution of the Solomon Islands was formed (Anckar 2002). With the implementation of the new constitution, new training opportunities were available for the public administrators and officials who were involved in the management of the public service in the Solomon Islands. In the 1970s, a new constitution was implemented that empowered chiefs with the ministerial and cabinet responsibilities (Fry 2000).

Furthermore, the British colonization period in the Solomon Islands ended on 7 July 1970. The civil strife started in the Solomon Islands from early 1999 to July 2003 (Liloqula 2000; Bennett 2002). In order to end the ethnic tension, the Regional Assistance Mission to Solomon Islands (RAMSI) started providing international peacekeeping forces to the Solomon Islands (RAMSI 2016). Australia provided the largest number of security officers, and this was complemented by New Zealand, Fiji, and Papua New Guinea. These security officers were responsible for restoring security in the country (RAMSI 2016). There were small reforms implemented in the Solomon Islands by the British administration, but major reforms came when the RAMSI reform machinery was implemented in the public service (RAMSI 2016). The RAMSI reform program was aimed at improving the productivity, efficiency, accountability, and transparency of the public service delivery by providing myriad support to the government agencies in the Solomon Islands (RAMSI 2016). Later, this program was refocused on improving the accountability and transparency of the public service delivery, developing e-government, and enhancing women's participation in the government's decision-making process (RAMSI 2016).

## Theoretical Perspectives Related to the Literature on Public Sector Reforms

The New Public Management (NPM) model dominated the discourse of academic literature since the publication of the article titled "A Public Management for All Seasons?" by Christopher Hood in the year 1991, the concept of NPM is based on seven important doctrines. The first doctrine of NPM emphasizes on "hands on professional management" principle of public service delivery. This principle states that discretionary

control is needed from top management so that public service officers feel a sense of responsibility while making decisions that have a direct impact on the public service delivery. Second is setting clear standards and definition of performance measures in the public sector so that the accountability and efficiency of public service delivery can be improved and each dollar of tax paid by citizens is effectively utilized in the provision of public goods and services. The third doctrine of NPM model is termed as the anti-Weberian philosophy, which states that public managers have to focus on the quality of public service delivery rather than on the bureaucracy at the workplace so that economic growth can be achieved. The fourth doctrine of NPM model emphasizes on dividing the public sector into manageable units and linking the goals and objectives of each unit to the overall objectives of the public sector. This doctrine of NPM model is designed to improve the efficiency and accountability of the public service delivery. The fifth and sixth doctrines of NPM model emphasize on the marketization of public sector activities and using contracts and tender process to improve the cost-effectiveness of the public sector. These two doctrines of the NPM model are directly related to the seventh doctrine which focuses on economizing the resource use, which implies getting more work done with less resource inputs.

There are four important criticisms of the NPM model (Kuhlmann 2010; Van de Walle and Hammerschmid 2011; Lodge and Gill 2011; Mayne 2017). First, the NPM model is seen as a universal model that may work in any geographical region. However, this may not be true as some factors unique to certain geographical regions may have an erratic effect on the overall objective that the NPM model is trying to accomplish. Implementing the doctrines of the NPM model may require skilled workforce and financial resources that many developing countries around that world lack and unable to afford while trying to achieve the objectives of the model. Second, Hood (1991) claims that NPM is apolitical model; however, this proposition of NPM model is subject to debate as the doctrines of NPM model are supporting the right-wing philosophical ideologies rather than left-wing philosophical ideologies of the government. Third, some critics have emphasized that there is no substance to the model as it is neither theoretically backed nor empirically tested. Fourth, there are some authors who have criticized that the NPM model is ineffective as it increases the cost of public service delivery. This is contrary to the objective that the NPM model is trying to achieve. The move from public administration to NPM model requires new forms of bureaucracy related to general operations of the public service. This has not been acknowledged by the NPM model.

There are conflicting views on whether NPM still applies or not. Pollitt (2003) emphasized that NPM is not yet over. Dunleavy et al. (2006) emphasized that the NPM model is dead. According to Orozco (2009), the end of neoliberalism during the global financial crisis and the resurgence of the role of government contributed to the demise of the NPM model. Osborne et al. (2013) argued that there is a need for a new model of public administration that addresses the flaws in the NPM model. Osborne and his colleagues proposed the need for a public service-dominant approach that draws upon public service theories. Perry et al. (2010), Kuipers et al. (2014), and Bryson (2018) argued that change management is crucial to improve the efficiency of the public sector. Figure 1 illustrates the development of the NPM model, its demise, and the rise of the new theories of the public sector reform, namely, neo-Weberian state, public value pragmatism, and public service motivation.

*Neo-Weberian state, public service motivation, and public value pragmatism*: According to Drechsler (2005), the reaffirmation of the role of the state after the global financial crisis, coupled with the resurgence of the Keynesian philosophy on the role of the government, has replaced the NPM model with good governance and public value pragmatism reforms. With the rise of the neo-Weberian theories of the state, the role of the government, as the protector of public welfare, has once again taken dominance over the role of the private sector in improving economic welfare (Snyder 2013; Hartley et al. 2013; Donina et al. 2015). The neo-Weberian state theories are based

on strong government influence, stability, and regulations, which is in direct contrast to the doctrines of the NPM model, which focuses on minimal government intervention, flexibility, deregulation, and marketization of activities (Drechsler 2014; Cepiku and Mititelu 2010).

Moreover, the NPM model did provide strong tools to correct the deficiencies in the traditional model of public administration. However, with the advancement of information computer technology, global trade, volatility of stock markets, and randomness of the global financial crisis, the governments are required to establish networks, foster private public partnerships, and establish collaborative networks with other nations around the world (Alonso et al. 2015a, b; Ongaro 2015). These public sector management techniques go beyond the output-focused doctrines of NPM and help to achieve public service motivation and public value pragmatism (Prebble 2015; Greve 2015).

*Keynesian and monetarism philosophies of the public sector reforms*: Under the Keynesian philosophy, the role of the government is crucial in correcting market failures and achieving economic stability (Mishra 2014). The public sector has three major objectives, and these objectives are (1) maintaining national welfare (Eikemo et al. 2008), (2) correcting market failures (Oates 2005), and (3) implementing policies on growth and national development (Ribot et al. 2006). This high level of importance given to the role of the government implies that the government spending, therefore, the size of the public sector, would be much bigger (Afonso and Furceri 2010; Cwik and Wieland 2011). Figure 1 shows that in the context of the developed and transitional economies, the role of the government was important until 1971, after which the role of the government became less important until the global financial crisis (GFC). The monetarism philosophies emphasize on greater importance on the role of the private sector, whereby the private sector acted as a stimulator of economic growth and development in the transitional and developed economies (Onaran 2011; Sawyer 2015). During the period 1971–2007, numerous reforms were implemented in order to reduce the size of the government (Atun et al. 2015; Featherstone 2015). The NPM-initiated reforms dominated the global agenda in both the developed and transitional economies. Interestingly, the role of the government became more important after the GFC when poor governance systems and economic policies, coupled with unsuccessful reform efforts, triggered a global recession (Claessens and Van Horen 2015).

Interestingly, the whole phenomenon of reforms has been different in the context of the developing countries. The role of the government was always important in the developing countries, while the reform efforts since 1987 were aimed to reduce the size of the government (Nepal and Jamasb 2015; Hansen and İmrohoroğlu 2016). Due to the heavy reliance on international development assistance, the governments in the developing countries had to follow NPM model-dominated reforms, thus giving rise to patronage governments (Kenny 2015; Wenner 2015). This is one of the reasons why many NPM-dominated reforms failed in the developing countries. The following sections will explain this in greater detail.

The next section will review the existing literature.

## Literature Review on Public Sector Reforms

One of the key attributes of a successful public sector reform program is to have a thorough understanding of the drivers of public sector reforms and different types of reforms that have been implemented in different geographical regions and an understanding of both positive and negative aspects of the public sector reforms. A thorough examination of these factors influences the design and implementation of any successful reform program. There have been numerous studies conducted on public sector reforms in the developed and developing countries; however, the success of reform efforts in the small island developing countries has been constantly ignored, although this should not have been done by practitioners and policy makers.

**External Force and Public Sector Reforms, Fig. 1** (**a**) Transition Period for the NPM Model for the UK, USA, EU and Large Developed Asian Economies. (**b**) Transition Period for the NPM Model for the Pacific Island Economies. (Source: Developed by the Authors of this entry (2017) by using information from literature review and their own economic intuition)

E

The intricacies of the argument on the reasons why the reform efforts in the public sector of the small island developing countries have been ignored lie on the small island country argument pioneered by Pilbeam (2013). Applying this argument to the public sector, one can argue that small island countries are not powerful enough to affect the global economy; therefore, analyzing reform efforts in these countries should be on the least important policy agenda, while examining the effectiveness of public reform efforts in the large transitional, developed and developing countries should be on the priority agenda.

*Influence of donor agencies in driving public sector reforms*: During the 1990s, the NPM model was seen as the universal solution to all public sector problems. Since the inception of the NPM model in the public sector of both the developed and developing economies, the impact that the NPM model had on reinventing the government agencies has led to mixed results (Samaratunge et al. 2008; Hout 2012; Andrews 2015; Thom 2017). There are a few cases whereby the government agencies have benefitted from the neoliberal agenda of the NPM model, while in other cases, failures have been noted (Booth 2012; Paul and Renmans 2018). In cases where the NPM model has contributed to the failure of the government agencies, the NPM model has bewildered a number of policy makers. The reinvention of the public service by using the private sector management styles was pressured on the industrialized nations by the OECD, while the World Bank and IMF played an essential role in driving reforms in the developing countries around the world (Brinkerhoff and Brinkerhoff 2015; Jackson and Jones 2018). Hall et al. (2005) highlighted that the developing countries should deregulate the water, energy, and infrastructure sector by encouraging the private sector involvement in these sectors. However, by opening up the provision of the public goods to the private sector, a number of problems have aroused, including a lack of return on investment and a strong political opposition.

According to Mwenda and Tangri (2005), the donor-driven reforms in the African nations have constrained the ability of the African leaders to hold political power as donor-sponsored reforms emphasize on reducing the size of the public sector and opening up the public goods market to the private sector. Ciborra and Navarra (2005) found that poor governance is one of the main sources of state failure in the developing countries. The donor agencies are using the e-government initiatives as an apparatus to reform initiatives in the developing countries. Nelson and Agrawal (2008) confirmed that donors have the ability to drive reforms by using tangible and non-tangible means; however, they have serious difficulties in improving the reform outcomes. This is one of the reasons why many reform efforts driven by the donors have failed in the developing countries. According to Crook (2010), the delivery of the public services in many developing countries has undergone reform efforts, but the public services in the developing countries are still in the problem. Some of the reasons why the reform efforts by the donor agencies have not been fruitful are lack of political support, overstaffing, and neo-patrimonialism. Brinkerhoff and Wetterberg (2013) found that there are a number of reasons why the health reforms have failed in the developing countries. Some of these factors are the disparities between the proper governance and local health practices, the differences between the formal and informal health governance system, and the lack of attention paid by the donor agencies to the sociopolitical powers in the health sector. Knack (2013) found that aid on public sector reforms may strengthen the recipient countries' governance systems when the aid use is monitored by the donor country. However, this governance system may not develop if the aid is monitored solely by the donor agencies. According to Gulrajani (2015), Dietrich (2016), and Cordery and Sim (2018), due to lack of transparency and accountability in the use of aid funds in the developing countries, the donor countries outsource the monitoring and use of the reform aid to the nongovernment development actors.

This study contributes to the existing literature in two ways. First, this entry examines the reforms that have taken place in the public sector of the Solomon Islands and the role of the donor agencies, particularly the RAMSI, in driving these reform efforts. This is the first study that examines

RAMSI's influence on reforms in the Solomon Islands. Second, it expands the existing gap in the literature by exploring the reasons for the failure of reforms in the small island developing countries.

## Research Methodology

The primary data for this entry were collected in the year 2014 by interviewing the government officials from the Solomon Islands. A semi-structured interview schedule was developed to collect data on two important research questions. One of the primary reasons for using the self-administered questionnaire to collect data from the respondents was to gather in-depth information on each of the research questions. It also allowed the researchers to probe on critical points that were raised during the interviews.

Before conducting the interviews, a sample of the number of ministries in the Solomon Islands was extracted from the following website: http://www.commerce.gov.sb/Gov/ps&mins.html. As per the information provided on this website, there were 24 government ministries, out of which 19 government officials allowed us to conduct interviews with the government officials from the respective ministries. Out of the 19 government officials interviewed from the Solomon Islands, 15 (78.95%) were males and 4 (21.05%) were females. There were two reasons for selecting the Solomon Islands as the country of study for this entry. First, the Solomon Island was facing severe ethnic tension in the early 2000s, which resulted in the donor agencies to invest heavily in the public sector reform efforts. Second, it was easier to collect data from the Solomon Islands government as they were open to providing resourceful information on the public sector reforms. There are a number of advantages of collecting qualitative data by using questionnaires in a small sample size research like this. First, data collected on small sample size, in this case on 19 ministries, will lack robustness and will be subject to biasness if empirical analysis is used for making conclusions. Second, qualitative analysis will provide better ways of making conclusions by using the data collected from the small sample size. One research assistant was hired to help the primary researchers collect data. Before the interviews were conducted, the interviewees were informed that their identities will be kept confidential.

Furthermore, thematic analysis was used to analyze data that was collected from this study. According to Braun and Clarke (2006), thematic analysis is an underacknowledged research technique that is used in a number of disciplines, such as psychology, management, accounting, and economics. A two-step procedure was used to analyze data collected from this study by using the thematic analysis (Braun and Clarke 2006). First, each question asked during the interviews was summarized, and common themes were determined from the responses of the informants. Second, these themes were reviewed and used directly as the subtopics in the discussion section. Axial coding was used to collate data for analysis and reporting purposes (Charmaz 2006).

## Research Findings and Discussions

The responses from the government officials were categorized according to the important themes that emerged during the thematic analysis. Microsoft Excel was used for the coding purposes. For the first research question, some of the important themes on the reforms that took place in the Solomon Islands in the last 10 years were human resource management reforms, legislation reforms, and decentralization of the public service authority. These three important themes were inductively rather than deductively conducted.

### Reforms in the Last 10 Years in the Solomon Islands

*Human Resource Management Reforms*: The proper development of the public sector system in the Solomon Islands was disrupted by the civil strife of the early 2000s. It was only after the year 2003 that reform was implemented with the help of the RAMSI to help improve the public services of the Solomon Islands. Some of the common

areas of human resource management reforms were performance management policy, absenteeism management, human resource governance reform, and remuneration reforms. According to the Ministry of Commerce, Industry, Labour and Immigration, reforms have been implemented in the Solomon Islands so that the transparency and accountability of the public service delivery could be improved. There are a number of areas where the Solomon Islands still needs to improve so that the overall public service delivery could be enhanced. According to one of the civil servants from the Ministry of Commerce, Industry, Labour and Immigration (Interviewee 8):

> Major reforms in the Solomon Islands public service are in the areas of performance management policy, absenteeism management, human resource governance reform policy and remuneration reforms. . .

According to another public service officer, human resources are the driving force of public sector management; therefore, public policies should be such that it enhances the motivation of employees. Without proper human resource management policies in place, it would be extremely difficult to position the right employees, at the right time with the right set of public policies. As a result of this, the public sector reforms in the Solomon Islands were aimed at improving the terms and condition of employment in the public service. According to one of the civil servants from the Ministry of Infrastructure and Development, the human resource management reform focused on (Interviewee 2):

> Terms and employment conditions, processes and policy revisions on recruitment and human resource management . . .

A similar comment was made by one of the civil servants from the Ministry of Lands (Interviewee 2):

> One of the obvious reforms was the change of the title of the Chief Administration Officer to human resource manager. This resulted in the upgrading of the CAO level of L10 to L12. . .

*Strategic Management Reforms*: Another key area of reforms in the Solomon Islands in the recent decade is the aligning of the policies and practices with the goals and objectives of the public sector. According to Snyder (2013), Hartley et al. (2013), and Donina et al. (2015), the recent rise in the neo-Weberian theories of state and the role of the government has become important in improving the welfare of the citizens. The RAMSI reforms have been aligned to improving the welfare of the citizens by improving the efficiency with which the public sector delivers its services. To successfully achieve the goals and objectives of the public sector, it is important that the internal policies and practices are consistent with the overall goals and objectives of the public sector. With the introduction of the strategic management reforms by the RAMSI, a mix of principles from the NPM and the neo-Weberian state has been adopted by the public sector of the Solomon Islands. The NPM model requires the adoption of the private sector management styles in the public sector; hence, with the RAMSI reforms in the Solomon Islands, the human resource management functions on training and recruitment have been delegated to the line ministries by the Ministry of Public Service. According to one of the civil servants from the Ministry of Marine Resources (Interviewee 3):

> Delegation of human resource management functions on recruitment and training from the Ministry of Public Service to Permanent Secretaries of Line Ministries. . .development of strategic human resource manual. . .amendment of general orders. . .

## Public Service Act Reforms

The Public Service Act of the Solomon Islands outlines the policies and procedures that help the public service to manage its human resources, code of ethics of the public servants, and equality and fairness in the public service decision-making. If the policies and procedures that affect the behavior of the public servants are not effectively spelled out in the Public Service Act, then reform of the Public Service Act is inevitable. The public sector reforms in the Solomon Islands have been inevitably directed toward developing proper manuals for the public service managers. These manuals act as a guiding tool for the implementation of ethics and professionalism in the public service. According to one of the civil

servants from the Ministry of Culture and Tourism, some of the areas of Public Service Act reform include (Interviewee 9):

> The development of the human resource management strategy for the Solomon Islands Public Service, recruitment and selection guidelines, code of conduct for public servants, Public Service Act and in-service training policy etc. . .

Similarly, another civil servant from the Ministry of Development Planning and Aid Coordination stated that:

> major reforms that have taken place in the public service include: (1) review of the general orders, (2) the recruitment and selection process to be effective and efficient, (3) establishment of first ever human resource strategic plan, (4) establishment of the code of conduct (5) review of the Public Service Act (a way forward for improvement), and (6) performance based process and making way for performance recognition. . .

*Decentralization of the Public Service Authority*: In the recent decade, decentralization of the public service authority has been one of the key tools used to improve the motivation of the public service. Unlike before, the decentralization of authority to the permanent secretary of each of the ministries will improve the workload and empowerment of the senior public service officials in the ministries. According to one of the civil servants from the Ministry of Agriculture, Health and Medical Services (Interviewee 13):

> Delegation of authority, for example, permission to leave the country, approval to enter the public service rental scheme has been decentralized to permanent secretary for each ministry from the Permanent secretary of public service. . .

Similarly, another civil servant from the Ministry of Defense and National Security stated that (Interviewee 19):

> . . .delegation of authority, including human resource functions, reviews of the general orders and review of the Public Service Act. . .

## RAMSI's Influence on Reforms in the Solomon Islands

The RAMSI has a strong influence on reforms in the Solomon Islands. One of the key areas where RAMSI has a strong influence on the public sector reforms is on capacity building and development. According to Grindle and Hilderbrand (1995), capacity building is an essential development initiative to improve the performance of the public sector. This is one of the reasons why the capacity building of the public servants in the Solomon Islands has been one of the key goals of RAMSI's reform initiatives. According to the public sector official from the Ministry of Lands, RAMSI has provided internship opportunities to the future public servants of the Solomon Islands. Another public sector official from the Ministry of Infrastructure and Development stated that RAMSI has played a significant role in training and development and capacity building of the public service officers.

Moreover, RAMSI has also provided support by organizing workshops, trainings, and technical assistance programs. According to the public service official from the Ministry of Foreign Affairs, the influence of RAMSI to the public sector reforms is as follows:

> . . .There is somehow now compliance to the changes. . .supported capacity building such as funded workshops and provided equipment's. . .. also provided technical assistance. . .

It is challenging for the small island developing countries, particularly the Solomon Islands, to invest financial budget for workshops and technical assistance programs. Unlike the developed economies, the governments of the small island developing countries lack financial resources to invest in these types of capacity building programs. Another public sector official from the Prime Minister's office stated that the influence of RAMSI to the public sector reforms is as follows:

> Yes, the RAMSI machinery of the government is the lead agency which provides technical support. . .they have also helped to develop the human resource strategy. . .This document provides the road map for human resource management reforms. . .

In addition to the above reform efforts, the RAMSI machinery has also emphasized on reforming the rules and regulations governing the operations of the public services. The goal of the reform efforts by the RAMSI is to improve the

transparency and accountability of the public service delivery. One of the ways how this transparency and accountability of the public service delivery can be improved is by improving the rules and regulations governing the operations of the public service delivery. According to the Ministry of Fisheries and Marine Resources, the influence of RAMSI on the public sector reforms is as follows:

> Review of relevant Acts/regulations like the Public Service Act, capacity building, decentralization of most of the human resource functions from the Ministry of Public Service. . .

Moreover, RAMSI provides a number of training and development opportunities to the public service officials. These training and development opportunities relate both to internal and external training opportunities. According to the Ministry of Justice and Legal Affairs, the influence of RAMSI to the public sector reforms is as follows:

> Under the capacity building efforts by the RAMSI, lawyers are provided with both local training and overseas training. . .

In addition to the reform efforts mentioned above, human resource management reforms are also essential in improving the motivation and performance of the civil servants in the respective ministries. The RAMSI machinery provided technical assistance in implementing human resource management reforms:

> . . .RAMSI is instrumental in providing technical assistance and play partner in implementing these human resource management reforms. . .

One of the notable aspects of the RAMSI machinery is that the officials of the RAMSI work closely with the Solomon Islanders while implementing reforms. There are a number of advantages of having collaborative reforms over the non-collaborative reforms. First, collaborative reforms ensure that the reform efforts are accepted by a majority of the public servants. Second, it also ensures that the goals of the reforms are easily achieved as collaboration gives rise to numerous ideas that can be easily implemented in the ministries. According to the Ministry of Culture and Tourism, the influence of RAMSI to the public sector reforms is as follows:

> . . .Yes, they work with the Solomon Islanders to develop and revise the existing human resource management regulations or policies and also write new ones that are seen to be relevant for improving the performance of public servants in the Solomon Islands. . .

Another instrumental change that has been implemented by the RAMSI is the setting up of the human resource management forums whereby everyone can discuss the areas where the human resource management reforms are needed. The main objective of the human resource management practices is to attract, retain, and develop skilled and qualified employees. One of the key ways how this objective can be achieved is by using forums whereby civil servants can get together to discuss the areas where the human resource management reforms are needed. According to the Ministry of Health and Medical Services, the influence of RAMSI to the public sector reforms is as follows:

> . . .RAMSI has helped to formulate the HRM strategy manual. . .and also provided funding. Their technical advisors assisted to help put the idea to help human resource processes and procedures throughout the public service. . .

There is also emphasis by the RAMSI reform machinery on modernizing some of the key areas of the public service delivery. These areas include correctional service, police, and public financial management. According to one of the public servants from the Ministry of Public Sector Policy, the influence of RAMSI to the public sector reforms is as follows:

> . . .there is some incremental support in developing the capacity of the line managers, also modernizing various Acts of parliament, for example, correctional service, police and public financial management Acts. . .

Unlike the traditional way of managing employee's performance, the performance appraisal of employees should recognize the merit-based performance system. The merit-based performance emphasizes on linking employee's productivity and output to rewards and incentives that are received by the employees. The RAMSI machinery has played an instrumental role in developing merit-based performance appraisal

system. According to the Ministry of Energy, the influence of RAMSI to the public sector reforms is as follows:

> Merit based recruitment and proper appraisals, bureaucratic procedures have lessened. . .... officers take part in performance management that is clear and transparent. . .

The next subsection will outline the theoretical contributions of this entry.

## Theoretical Contributions of This Entry

This entry confirms to the existing theoretical perspectives in a number of ways. First, this entry argues that external forces are driving public sector reforms in the small island developing countries with the idea of reducing the size of the public service. However, the government is still playing a pivotal role in driving the reform efforts, and there is a lack of evidence that the size of the government has reduced. Reforms were implemented to improve the transparency and accountability of the public service, but these reforms were not successful because the outcomes of the NPM model have not yet been achieved. One of the crucial achievements of RAMSI reforms is that the human resource management functions on training and recruitment have been delegated to the line ministries by the Ministry of Public Service.

Second, the reform ideologies of the RAMSI deviate from the propositions of the NPM model. The NPM model argues that neoliberalism would improve the transparency and accountability of the public service delivery. However, in the case of the Solomon Islands, the RAMSI has involved the public service officers directly in the reform process. This contradicts the ideologies of the NPM model and advances the philosophies of the neo-Weberian state and public value pragmatism. The NPM model focuses on minimal government intervention, flexibility, deregulation, and marketization of activities (Drechsler 2014; Cepiku and Mititelu 2010). By involving public service officers directly in the reform process, it is noticeable that the move is away from NPM-driven reforms to neo-Weberian state and public value pragmatism.

## Policy Implications of This Entry

There are two policy implications of this entry. First, policy makers and the institutions that drive reforms need to recognize the importance of involving the national governments of the developing countries in the reform process. The public servants in the aid-receiving countries that are reformed have more knowledge and understanding of the problems of public service delivery in their own country as compared to the outsiders who are usually hired as consultants to drive the reform process. Involving the public servants will ensure that these problems are effectively tackled with less stress on the public service resources. Second, there are a number of key areas that need improvement in the Solomon Islands. These areas need to be prioritized before the RAMSI reform efforts are implemented in order to ensure that reforms are effective for the Solomon Islands public service.

## Conclusion

The main aim of this entry was to answer two important research questions. The first research question was to examine the types of reforms that have taken place in the Solomon Islands. This entry found that a number of different types of reforms have been implemented in the Solomon Islands. These reforms are mainly on human resource management reforms, Public Service Act reforms, strategic management reforms, and decentralization of public service authority. The second research question was to examine the main drivers of reforms in the Solomon Islands. This study found that the RAMSI is playing a pivotal role in driving reforms in the Solomon Islands. They are focusing on a number of key areas of reforms; however, a reform diagnostic strategy should be adopted in order to ensure that reforms are successful.

One of the limitations of this study is that it is based on the Solomon Islands. Future researchers should conduct similar studies in other small island developing countries so that findings from this study can be compared with other small island developing countries.

## Face of Leadership, The

Sylvie di Giusto
Executive Image Consulting LLC, New York, NY, USA

### Introduction

When it comes to leadership, image matters. Every hour of every day, humans evaluate their environment based on what they see and hear. They avoid situations and people that seem threatening. They gravitate toward situations and people that appear welcoming. When they meet someone, they use sensory information to quickly determine if they are going to get along with them or if they need to keep their distance. Just as they judge others, they are judged by the people who meet them or see them in the media. Do they appear trustworthy? Confident? Or do they appear uncertain or detached? People who meet one another make decisions about one another. Should they hire them? Vote for them? Buy something from them? Anyone who aspires to a position of leadership in any capacity needs to understand the power of image. Image is something that can be controlled. It can be shaped and molded to the favor of almost anyone and help them rise to a level of leadership. This is a combination of dress, attitude, and how they communicate with others in person and increasingly becoming more important, also online on the Internet.

### How Are First Impressions Built

A "professional imprint" is what is left on someone's memory after they have met you. The professional imprint occurs within seven seconds. It's quick and indelible. Your professional imprint reflects directly what level of care or time is spent on a person's own valuable assets.

Emerging science links the seven-second imprint to measurable brain activity. Our neural systems are involved in forming first impressions of others. The human brain encodes social information and then evaluates it in making initial judgments. Each new person whom we meet presents a set of ambiguous and complex information. Because it's a first meeting, the information is primarily visual, although other senses – hearing, smell, and even touch if people shake hands – can come into play. The human brain quickly sorts through this information and judges whether it is attracted to that person or not. It's an ancient and deeply embedded process that allowed our ancestors to quickly assess a relationship to a new person. Friend or foe? Social superior or inferior? And perhaps most significantly, will this person be useful to the group – a leader – or will he or she be a burden and consume more than they contribute?

When humans only briefly encounter others and have limited and ambiguous cues to evaluate, brain regions that are important in emotional learning and representing value are engaged. When encoding everyday social information

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

during a social encounter, these regions sort information based on its personal and subjective significance and summarize it into a single value, that is, a first impression made within seven seconds. Thus, our emotional learning + our values = the person's imprint left with us.

Research suggests that it's not just one thing that people judge about an individual in those seven short seconds after meeting them, but at least eleven different factors. These include:

1. Socioeconomic level
2. Education level
3. Competence and honesty, believability, and perceived credibility
4. Sex role identification
5. Level of sophistication
6. Trustworthiness
7. Level of success
8. Ethnicity
9. Religious background
10. Political background
11. Social/sexual/professional desirability

Different contexts of the first meeting – professional, social, romantic – will rearrange these factors according to varying levels of importance.

## Why Are First Impressions Important

First impressions can mean the difference between getting a new job and standing in the unemployment line and between getting the promotion and being stuck in the same position for many years or the difference between winning the run for office and standing on the sidelines while the other guy gives his victory speech. As a leader, your first impression is what dictates if others will work with the organization you are representing or their competitor. True leadership manifests itself in ways that are both seen and unseen. They are equally important. While all leaders have their own individual styles and personalities, it cannot be doubted that the most effective leaders who succeed over a long period of time are seen and accepted because their interior skills and exterior images are in perfect alignment. In other words, what you see is what you get. As leaders they are consistent and dependable, and their professional imprint is strong and durable.

## Confirmation Bias

Confirmation bias is a powerful force that's, for example, used in marketing, sales, or politics. "Confirmation bias" is the tendency to interpret new evidence as confirmation of one's existing beliefs or theories. Confirmation bias compels a person to ignore any signs that go against their first impression. If a person sees a stain on someone's shirt or dress, they will look for evidence in their behavior and their communication that will reinforce the evidence provided by the stain that the person is sloppy in their work style. If a person forms the impression that someone is well groomed, dressed appropriately, and exudes confidence, they'll gladly take additional information – for example, the words that are said – and fit it against the model they have formed in their mind that the person is a leader. If the new information matches, the effects of confirmation bias are multiplied in their favor.

You see this often in popular figures in the music industry. They are often scrupulous about the respective images they project to the public. They use confirmation bias to reinforce the intuitive first impressions people get of them. Once someone believes, for example, a certain singer is wild and uninhibited, they assume that just about anything he or she does is a reflection of their wild and uninhibited attitude. The message is conveyed by their total imprint: clothes, hair, makeup, attitude, song lyrics, and dance moves. They take the necessary steps to ensure that their public wild-child persona is both vivid and consistent.

## Five Common Characteristics Important to All Successful Leaders

Confidence, respect, authenticity, control, and professionalism are the five most important

image-related characteristics to all successful leaders.

*Confidence*: Most leaders become successful leaders because they exude confidence. Not only are they confident about their abilities to succeed, but they are confident about their bodies, their hair, their style of dress, their age, their height, and their gender. When they meet another person that confidence is present at all times. They are prepared for anything. Does this mean they have a perfect body with no flaws? No it does not. What it does mean is that they know how to use their clothing and style to draw attention to all of the best parts of their form and draw attention away from the parts that are not so pleasing. They accept their flaws and work with them or work on them. They accept the body they are in now and have complete confidence in it, but they also know the importance of striving toward better health and fitness. They have the attitude of a confident person and don't let these perceived flaws real or not hinder the way they behave or communicate with others. Making jokes and excuses or complaining about their weight, height, and gender doesn't come into play because they know that in order for them to be trusted to make tough decisions for others, leader decisions, they have to show they are confident about the choices they make for themselves.

As a leader, physical aspects are quite important – maybe just as important as everything else. There are very few overweight Fortune 500 CEOs out there. While getting thinner doesn't directly impact that a leader will become a Fortune 500 CEO, it shows that they are in control, that they are disciplined, and that they take care of themselves. It shows that this leader has the discipline and time management skills to exercise in the tiny amount of his or her free time. It shows that this leader takes care of himself or herself, and therefore people assume they can take care of others. Many times these physical attributes also lead to an increased level of confidence.

*Respect*: Leadership is a matter of both showing and earning respect. First, leaders have to show respect for themselves. While there is no one-size-fits-all formula for leaders, there is one thing all leaders have in common: they respect themselves. This means first and foremost that they are willing to invest time and effort into themselves. They give some thought to their own bodies, to their day's activities, and to the people they are going to meet before choosing an outfit in the morning and while grooming themselves in their bathrooms. While looking into their mirrors, they are aware that it's not going to be the last time they see the output of these efforts today. They know that sustained effort, day after day, week after week, will help them live up to their self-created professional imprint.

One of the biggest parts of respect is self-respect. How can a leader gain the respect of others if they do not respect themselves? Often this comes from taking the time to work on themselves inside and out. To both improve their own feelings of self-worth and stay healthy, they set aside time and pamper themselves. They get a degree, become certified in their field, take classes outside of their field, or learn another language. They make sure that you stay up to date on the news in their field and that they know what the major talking points are. These ensure that others see them as someone who is determined and hard-working. They are someone who is in the know and who increases their overall value to their employer.

They show respect for themselves by investing in the right clothing and spending money to look the part. Investment pieces are timeless pieces in their wardrobe. They help leaders to never be at a loss for what to wear, no matter the occasion. They send out signals like, "I'm ready for serious business." They ensure their clothing fits properly.

Second, while it's important for their self-esteem, showing respect for themselves makes people believe that they also have the ability to show respect to others. Most people want to be respected by others. This is true not only in their private lives, but also at work. Respect is earned over time, in countless interactions under a variety of situations. Anyone who has run for high political office knows this. You need to maintain your professional imprint every moment of every day. Successful leaders understand that their respectful appearance and attitude is an investment, not a burden.

*Authenticity*: Leaders know that trying to be something they are not comes off as unauthentic. This can not only lose them respect, but it can muddle the professional imprint they are attempting to secure. They know that in choosing their clothes and defining their appearance, one of the best attitudes they can take is to say, "What you see is what you get!" Like it or not, people also have expectations that leaders can either fulfill or defy. Ninety-nine percent of the time, they will want to fulfill people's expectations of who they are based on their appearance. The most authentic leaders in the world are consistent in what they wear every day. Some are known for their elegant aesthetic and others for their creative appearance. No matter which signature look they have chosen, it consistently says something about them and the person they are.

There are certain style personalities who work very well for certain industries and professions. Leaders know how to work best within the style personalities that fit the industry they work in or wish to work in. They know that often they can indulge in slight variations of their own favorite styles, but ultimately also have to stick to styles that fit into the molds of the industries they work within.

For example, a woman who wears a pastel-colored, soft, unstructured, flowing blouse with ruffles, paired with a cute A-line skirt and a fitted jacket in cream, would be considered to be a "romantic"-style personality. Supportive, caring, warm, and nurturing are the attributes most would automatically link to this person. Therefore, this style personality works especially well in professions that are people related, such as counseling, social working, teaching, or nonprofit. If they dress traditionally – meaning a navy blue two-piece suit, with white shirt, silk tie, and black oxford shoes for a man – they are presenting an image that appears reliable, authoritative, trustworthy, and consistent. Those are important traits for jobs such as management positions or financial consulting.

*Control*: Endless stories have been written about the many things that successful C-level executives do at the break of dawn: from working out at the gym to mapping out the day and recording that day's personal and business goals into their smart phones, flipping through the hottest business news, and putting on their neatest suit before giving a quick interview over the webcam and to a fresh, light, and of course organic breakfast with their beautiful wives and children. They seem to work a full day even before they hit the morning rush hour. They almost seem they are superhuman – but of course they are not. What they want us to think is that they have everything under control. While they see the "big picture," they don't lose sight of solid ground. And while most people's brains think about whether they would be able to do all those things, they just do it. And they do it right. They don't do it by halves. Leaders don't like semifinished projects. They like action, discipline, and results. Leaders want to cross the finish line. Self-control and self-discipline is a must for leaders. If they can't organize themselves, their ability to have others follow them is very doubtful. Successful leaders are usually highly self-controlled; they have a tremendous sense of organization.

Each leader has a message that they want to portray to the world. They either control what the message is, or they allow the world around them to make assumptions about what their message possibly is. A lack of attention to details immediately sends a message that they are uncontrolled or disorganized. People think leaders can't do great things at work if they don't feel good and look good. Successful leaders eat well, exercise, and care for the one thing that's their most important asset – their bodies. They are operating at the highest level of performance and control of themselves, and therefore they are able to do the same for their team members and their companies.

While they know controlling their clothing and outer image is important, they also control the people they surround themselves with from friends in real life to their friend list on Facebook and to those who tagged them on Instagram after last weekend's party; their family, including their

parents and children, and their husband or wife at the company's Christmas party are all part of their image. They have allowed them to be part or chosen to make them part of it. They surround themselves with people who are smart, driven, and like minded and who reflect the person they want to be. Relationships should help them, not hurt them. They choose wisely. They know these people will have an influence on how successful they will be.

They control their environment. Leaders often have implacably clean offices and workspaces. They are organized and generally not cluttered with pictures, stacks of paperwork, trash, coffee mugs, and souvenirs. Their spotless desk often sits as another achievement in their demanding positions.

*Professional*: Everyone agrees that leaders have to look professional. Their professional appearance certainly can make or break them and their career. If they want to be perceived as competent, as someone who has a purpose, who is important, and who is serious about the things they do, they know they have to act like a professional in everything they do – including their wardrobe choices. Looking professional can be related to living within the appropriate dress code. There are five different levels of business attire that all leaders know well and live by.

### Dress Code Level 1: Boardroom Attire

For a male professional, boardroom attire is limited to a black, navy blue, or charcoal suit, a white shirt, and a discreet tie in a modest color, in plain, or with a very subtle pattern. Black shoes only, Oxfords or Derbys, probably with a cap toe, and high-quality accessories including the wristwatch and attaché case. Less is more. This is the attire leaders choose if they are a member of the highest level of any governing body, private or public. No exceptions. The rules are pretty much the same for women – which means a classic two-piece suit with a white blouse, an elegant pair of black closed-toe pumps, and without any doubt, no matter the seasons, pantyhose.

### Dress Code Level 2: Traditional Business Attire

It gets a little bit more flexible with traditional business attire, which is the attire leaders may have to wear on a daily basis in their offices. As male professional leaders can add pinstripes to their suits, white shirts can be replaced with bright blue ones, ties can be more colorful or patterned, and shoes might even be allowed in a dark brown tone. However, it's still a very ambitious and high-level dress code. Same again is true for women, who can add more color to their suits or shirt blouses and even choose a nude or colored pump. Bad news is still no open toes and still no excuse to skip the pantyhose.

### Dress Code Level 3: Executive Casual

Here professionals are allowed to wear slacks and sports coats and choose patterned fabrics and more colors. It's obviously getting more relaxed. Men can skip their ties or change them for a trendy woolen one. Monk-strapped shoes or elegant loafers can be worn. Women can add unique accessories and show their individuality by wearing bright colors and fabrics. At this level it would be the first time they may be able to consider an open-toe shoe. You still need pantyhose, but never together with an open toe.

### Dress Code Level 4: Mainstream Casual

Men can skip the formal dress shirt and wear a more casual shirt, maybe even combined with a sleeveless sweater. Men still would wear it with a pair of slacks and combined with shoes that are very much relaxed but elegant. Women can exchange their blouse shirts to tops, even with short sleeves, although it is still recommended wearing a vest with it. And finally, pantyhose are not tremendously important.

### Dress Code Level 5: Baseline Casual

For those who aspire any kind of leadership responsibility, this dress code level doesn't really have any relevance. It's what someone might wear in a private environment, certainly not at the office. For an executive, it may be appropriate at a rustic corporate retreat with outdoor activities.

A leader's professional imprint needs to be positive. It needs to create the aura of executive presence. It's a feeling of leadership and confidence that leaders inspire in everyone with whom they come into contact. Leadership roles are given to people who exude executive presence, which is defined as individuals who look and act like leaders. Promotions are not just a function of skills and aptitude. Executive presence is "a required yet unwritten" competency for leaders. It is estimated that executive presence constitutes one-quarter of what it takes to get promoted. Executive presence is made up of three distinct qualities: gravitas, communication, and appearance. Gravitas is communicated by the way a person speaks and acts and signals to colleagues that they are someone worthy of being heard and followed. Communication involves the ability to speak directly and to convey not only the substance of their ideas but a sense that they should be listened to. Appearance opens the door and gets them invited in. Good grooming – looking polished and put together – matters. A high percentage of senior executives believe that "unkempt attire" detracts from a person's executive presence.

## The Cost of a Poor Professional Imprint

While it's a leader's job to project a positive professional image and reputation, the fact is that no one is infallible. In the end every leader is a human being who can make mistakes. Some of those mistakes can be quietly dismissed, while others show up on the first page of Google. It might be that they drank too much at the company's Christmas party, they really, really, really found that tweet funny and had a great laugh, or they just didn't have a good hand when choosing this morning's outfit before meeting the CEO of their company. But if they don't strive to maintain the highest possible professional imprint in everything that they do, the consequences might be painful:

- Lower productivity
- Disrespect (from others)
- Distraction (from work or performance)
- Preconceptions that can damage their career
- Missed opportunities
- Financial penalties
- Sexual Harassment
- Bullying

People have lost jobs or elections over far less. It often takes just one moment (or one simple click) and an image is instantly destroyed. Luckily, we live in a nation of second chances. But you can only make that mistake once. Therefore, the first step in order to repair a professional image is to make sure it doesn't happen again. There is no "second chance" for a "second chance."

## Conclusion

Leadership is so much wrapped into one person. It is attitude, behavior, communication, and your digital footprint. These are called the ABCDs of the professional imprint.

*Appearance* includes every visual element that can be seen and understood in the first seven seconds: physical fitness (or lack thereof), hair and nails, suit and shoes, posture, and eye contact. In any situation where leaders have only one chance to quickly impress another person – it could be an interviewer, a new boss, a recent addition to a team, or a potential client – it's important to ensure that leaders create the best first impression. Before they ever utter a word, the other person is going to look at their clothes and immediately decide whether they have dressed appropriately for this occasion. If they show up looking like they got dressed in the dark (e.g., a rumpled shirt for men), the chances are good that the other person is going to apply that perception elsewhere. Perhaps they'll assume that they have a sloppy working style and that paying attention to details is not their strong suit. Appearance is a form of nonverbal communication and one that speaks very loudly.

*Behavior* includes the sum total of their actions. It's their attitude. A leader is an individual who has earned the respect of others and who leads them effectively and in the right direction.

Leadership is able to inspire at all times, and the key to this is attitude. A leader's attitude evokes positive feelings in people. Effective leaders use influence to orient others toward their goals. Being a good leader is less about being the smartest and more about understanding others and what makes a team work together to reach solutions. Personality is central to the workplace; depending on their personalities, people come together in harmony or in conflict, and tensions can easily be caused. The best leaders will harness the strengths and skills that people have and use them to their best abilities, meeting the demands of the workplace. As the workplace becomes more flexible, diverse, and mobile than ever before, leaders need to adapt to the changes and see them in a positive light. The best leaders inspire their teams to work hard on a long-term basis. The visionary leader inspires through exciting ideas, and their teams follow them and are motivated by their enthusiasm and knowledge. The empathetic leader relates well to others and is able to relate to and understand their experiences. The ethical leader abides by rules about behavior, with every employee adhering to these rules and the workplace becoming a moral environment. Whether they inspire their team by providing a sympathetic ear or by setting a positive example, a good attitude helps a leader reach those goals and ultimately win over others. Armed with a positive attitude, they can rally their staff around them and reward staff when they reach their goals. Great leaders listen to their staff and understand how to make the workplace a happier, as well as more productive, environment. Leaders with positive attitudes find that their followers appreciate the personal connection, whether it's through empathy, vision, or reward systems, and that ultimately people respond much better to someone who empowers them.

*Communication* is sharing information and ideas between individuals and groups to reach a common understanding. With so many personalities, ideas, and an overload of information in the workplace, effective communication is a challenge for business owners, CEOs, managers, and employees. Effective communication is a business tool and essential employee attribute. A company knows that in order for its objectives to be met, communication is the key to success. Communication links and facilitates all aspects of a company. When all members of a team, department, and workplace communicate effectively together, then productivity increases, a better workplace environment is created, and objectives are met more efficiently. Communication is not only important in the workplace, but for the company when dealing with partners, clients, and vendors. The way leaders communicate sets a precedent for the company; therefore, their communication needs to be clear, persuasive, and concise. If they can learn to openly and effectively communicate, they will set themselves apart, and opportunities will come their way more frequently. Fortunately, effective communication is a skill that can be learned. They are there because they will contribute to the organization's growth and provide leadership to their colleagues. Everything they say and do must confirm what their colleagues or audience members have decided in those first seven seconds that they are a winner and a potential leader

*Digital footprint*. This is how leaders present themselves on the Internet. As we move into the twenty-first century, this factor that once existed only in science fiction is becoming increasingly important. Like it or not, the Internet and social media provide new avenues for both advancing a professional imprint and for incurring damage to a reputation. Online digital reputations have never been more important. While years ago much of our personal information was considered private, today our digital reputations expose more information about our lives than ever before, and information about almost all adult Americans can be found online. Online digital reputations define how people perceive one another without ever having a single conversation with that person. The fact is, a digital reputation can be incorrect, it may present only partial information, and it might even allow for slander and online attacks to define someone. The Internet consolidates information about people, their family, their friends, and their business and delivers that information through a simple search query. This

information can have a lasting presence online, permanently impacting almost anyone. Exposure of this private digital information can profoundly influence whether or not a person lands a new job or gets a promotion. Leaders are proactive about protecting their digital reputation. Once a reputation is tarnished, it's almost impossible to make it shine again. Leaders often check their digital reputation by searching for all the variations of their name; each will offer potentially different search results. As they review their online digital reputation, they make sure that their findings reflect the reputation they'd like to share with the world, with current and future employers, colleagues, friends, and family members. They know that their online reputation can be a determining factor for hiring or being offered that important initial interview. They look at their Internet profile as a second self, the one they want everyone to know in addition to their real self. Just as they use office etiquette in the workplace and save their rougher side for watching the football game, they take time to distinguish their online reputation from how they may behave in private. They know their online reputation should say what they want it to say and no more. It can also be a fine line. Having no personal information on Google can be just as damaging as having inappropriate content.

# Failure of Corporate Governance in Banking Sectors of Bangladesh

Shirin Sultana
Lecturer, Department of Law, University of Dhaka, Dhaka, Bangladesh

## Synonyms

Corporate governance; Financial institutions; Public banks

## Definitions

| | |
|---|---|
| Public and private bank | Public banks are those banking institutions where the majority shares are owned by the government, and private banks are those banks where the majority shares are owned by private persons. |
| Nonperforming loan | Nonperforming loan is a loan that is in default or close to being in default. They are nonperforming as the loans cease to perform or generate income for the bank (BB 2017). |
| Transparency | A state of affairs in which the objectives of policy; its legal, institutional, and economic framework; policy decisions and their rationale; and data and information related to monetary and financial policies, and in terms of agencies' accountability, are provided to the public on an understandable, accessible, and timely basis (IMF 1999). |
| Accountability | Accountability exists when there is a relationship where an individual or body and the performance of tasks or |

functions by that individual or body are subject to another's oversight, direction, or request that they provide information or justification for their actions (WBI 2007).

## Introduction

In the age of globalization, corporate governance has become a buzz word, which is of great importance for markets all around the world. There has been a renewed interest in the corporate governance practices of modern corporations since 2001, particularly due to the high-profile collapses of a number of large United States firms such as Enron Corporation and MCI Inc. (formerly WorldCom). Research studies also found a close link between corporate governance and economic development. It is said that efficient corporate governance system can promote the development of robust financial systems. It is also believed that practice of corporate governance within any institution can boost the performance of that very institution in an effective way. It helps to provide a degree of confidence that is necessary for the proper functioning of a market economy. Banks, as vital institutions within the economy of a country, play a crucial role in capital flow. These are the essential constituents of any economy. Accordingly, the proper governance of the banking sector is vital for the growth and development of the economy of any country and of the country as a whole. And only the practice of corporate governance within the banking sector can ensure proper governance. This is also true in the case of Bangladesh. But Bangladesh has a history of failure in this respect.

## Corporate Governance in General

Definitions of corporate governance vary widely. Corporate governance in its earlier time was defined as the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment (Shleifer and Vishny 1997). Corporate governance, as per Gabrielle O'Donovan, is an internal system encompassing policies, processes, and people, which serve the needs of shareholders and other stakeholders, by directing and controlling management activities with good business savvy, objectivity, accountability, and integrity (O'Donovan 2003). Nowadays, corporate governance is seen as an umbrella term, which in its narrower sense depicts the formal system of accountability of corporate directors to the owners of companies and, in a broader sense, depicts the entire network of formal and informal relations involving the corporate sector and the consequences of these relations for society in general (Huse 2005; Berghe and Louche 2005; Rahim 2012). These two aspects are not alternative, but rather complementary, and by combining these two definitions it is claimed that corporate governance is not merely about maximizing profits of the company, but rather it is concerned with a company's interaction with all the stakeholders (Ararat and Ugur 2003). Corporate governance in the present day context encompasses the interests of not only the shareholders but also many stakeholders, which includes employees, customers, suppliers, and the community, and complies with the legal and regulatory requirements, apart from meeting environmental and local community needs. A good corporate governance mechanism improves the health of the corporate sector, thus enhancing national competitiveness (Masood 2013). In the present day context, corporate governance is about commitment to values, about ethical business conduct, and about making a distinction between personal and corporate funds in the management of a company. In this sense, corporate governance is a blend of some policies, procedures, customs, laws, and institutions, affecting the way a corporation is directed and controlled with a view to enhance business prosperity with corporate accountability (Alam and Akhter 2017). The importance of corporate governance lies in the fact that it works to accomplish the goals of an organization by balancing the relationship among the stakeholders, including the board of directors and the shareholders who often have conflicting interests. It also deals with the accountability of the

individuals through a mechanism which reduces the principal-agent problem in the organization. How the mechanism of corporate governance works within a company or organization may vary due to the differences in nature, structure, function, place, and situation of the company or the organization. But there are some common working instruments (elements) for corporate governance. These are complete openness; spreading of knowledge in the board's composition; frequent meetings; splitting-up of special functions; thorough preparation and recording of all meetings; replacement of weak or regularly absent directors; sufficient time to discuss; maintaining due disclosure standards; and risk management (Siebens 2002).

## Corporate Governance in Particular (Banking Sector)

Banking is the crucial factor affecting the economic development of an economy. It is the lifeblood of a country. It is responsible for the flow of credit and for maintaining the financial balances of the economy. Banks are different from other companies in a variety of ways. The main point of difference is the capital structure of banks and the liquidity creation function. Banks engage in the business of accepting deposits and giving loans. They lend money borrowed from depositors to customers who apply for loans. Accordingly, the collapse of banks will result in monetary loss for the depositors. It is imperative that the interests of depositors be protected. This is also one of the main reasons for corporate governance assuming greater importance in banking sector. Poor governance can result in bank failures, which may cause significant costs to all the stakeholders and also to the economy in general. Poor governance arrangements in banking systems include inadequately qualified and experienced bank directors, and directors with significant conflicts of interest; insufficient understanding of the nature of banking risks by a bank's directors and senior management; inadequate representation of nonexecutive and independent directors on the board; inadequate risk management systems, internal controls, and internal audit arrangements; insufficient accountability of directors; inadequate oversight of senior managers by boards of directors; poor quality financial reporting to the board; and insufficient rights for shareholders. There is also the possibility of broader macroeconomic implications. As such, there exists consensus on the point of necessity of corporate governance in banking sector, though many differences exist in banking corporate governance systems all over the world. Corporate governance in banks boosts the performance of the banks. It reduces the risk of capital outflow from an economy and, at the same time, increases the flow of capital in the economy. The degree of adherence to the basic principles of corporate governance by the banks enhances the confidence of the investors of those banks as shareholders and potential investors require access to regular and reliable information in detail for them to assess the management. Macey and O'Hara (2003) argue that a broader view of corporate governance should be adopted in the case of banking institutions, arguing that because of the peculiar contractual form of banking, corporate governance mechanisms for banks should encapsulate depositors as well as shareholders. Arun and Turner (2003) supported the need for the broader approach to corporate governance for banking institutions.

The corporate governance of banks is different and unique from that of other organizations. This is because the activities of the banks are less transparent than the other organizations. Thus, it becomes difficult for shareholders and creditors to monitor the activities of the bank. The situation becomes even more difficult when a major part of the share capital is with government. Additionally, banks also differ from most other companies in terms of the complexity and range of their business risks and the consequences if these risks are poorly managed. In banking parlance, the corporate governance refers to conducting the affairs of a banking organization in such a manner that gives a fair deal to all the stakeholders, i.e., shareholders, bank customers, regulatory authority, and the society at large (Masood 2013). The fundamental objective of corporate governance in banking sector is to enhance the long-term shareholder value, while protecting the interests of other stakeholders; maximizing long-

term shareholder value in a legal and ethical manner; and ensuring fairness, courtesy, and dignity in all transactions within and outside the bank with customers, employees, investors, partners, competitors, the government, and the society. Good corporate governance within the banks can ensure sound corporate performance by providing protection for shareholders interest (OECD 2004). Investors and lenders will be more willing to put their money in firms with good governance because they will face lower costs of capital, which is another source of better firm performance (Coombes and Watson 2000). Other stakeholders, including employees and suppliers, will also want to be associated with and enter into business relationships with such firms, as the relationships are likely to be more prosperous, fairer, and long-lasting than those with firms with less effective governance (Alam and Akhter 2017). Apart from the basic principles of corporate governance, while determining the standard of corporate governance in a banking institution, certain points need special consideration, i.e., constitution of the board of directors, transparency, accountability, policy formulation, internal controls, and the formation of committees of the board of directors. The Basel Committee on Banking Supervision in 1999 recommended four important forms of oversight that should be included in the organizational structure of any bank in order to ensure good corporate governance. They are (i) oversight by the board of directors or supervisory board; (ii) oversight by individuals not involved in the day-to-day running of the various business areas; (iii) direct line supervision of different business areas; and (iv) independent risk management and audit functions (Masood 2013). The complete structure of a good corporate governance model of a bank is depicted in the Asian Round Table on Corporate Governance (ARCG) task force. They developed a policy brief on corporate governance of banks in Asia dated June 2006 (Mahmood and Islam 2015). The main issues and priorities for reforms in corporate governance of banks in Asia that were identified are:

- Responsibility of individual board members – fiduciary duties of banks' board members, need of skills, personal abilities, training programs on integrity, and professionalism.
- Roles/functions of the board – guiding, approving, and overseeing strategies/policies rather than being immersed in day-to-day operations; creating clear accountability lines and internal control systems; and ensuring sufficient flows of information and managerial support.
- Composition of the board – banks are more encouraged to have independent directors than other firms and to separate between Chairman and CEO.
- Committees of the board – audit committee, the risk management committee, the governance committee with combined responsibilities of nomination, remuneration, succession planning, training, performance evaluation, etc.
- Preventing abusive-related party transactions – inspection of the existing firewall and creation of specialized committee to monitor and approve related part transaction and publicly disclose such transaction.
- Bank holding companies and groups of companies holding banks – a bank's parent company should not impede the full exercise of the corporate governance of the bank within the banking group.
- Disclosure – effort on meeting into international standards on accounting etc. should be encouraged.
- Bank's autonomy in relation to the state – state as an owner should respect the legal corporate structures of State Owned Commercial Banks (SOCB).
- Bank's monitoring of the Corporate Governance structure of its corporate borrowers – extent to which banks should assess/monitor corporate governance of their corporate borrowers or seek to improve it.

## A Brief Summary of the Banking Sector of Bangladesh

The banking sector of Bangladesh is one of the major contributors to the Bangladesh economy with the commercial sector playing a pivotal role

in the financial sector. The first bank in Bangladesh was established in 1846, named as Dacca Bank during the then British India. Dacca Bank was later purchased by Bank of Bengal in 1862 with another three branches. After the partition of 1947, a total of six branches were in existence. After the independence of Bangladesh, the banking sector began with six nationalized commercialized banks, two state-owned specialized banks, and three foreign banks. The Dhaka branch of the State Bank of Pakistan was renamed as Bangladesh Bank and it was deemed as the central bank of the country, by the new independent government of Bangladesh. Bangladesh Bank was since then responsible for the majority of financial controls of most of the financial institutions of the country, including regulating currency, credit controlling, monetary policy, exchange control, and foreign exchange reserves. In the 1980s, the banking sector of Bangladesh achieved significant development with the establishment of a number of private banks. Since then, various other forms of financial institutions have been formed in Bangladesh. Apart from the central bank, all other banks can be classified into two forms, namely scheduled banks and nonscheduled banks. Banks operating under the Bank Companies Act 1991 are categorized as scheduled banks. State-owned commercial banks, private commercial banks, Islamic commercial banks, and foreign commercial banks fall under this category. Banks established for distinct and specific objective and fall under nonscheduled banks. They do not hold as much power as the schedule banks since they do not have all the functions present in the scheduled banks. Apart from the central bank (Bangladesh Bank), at the end of the year 2017, there existed 57 scheduled banks in Bangladesh who operate under the full control and supervision of Bangladesh Bank, which is empowered to do so through the Bangladesh Bank Order, 1972, and Bank Companies Act, 1991. Among the scheduled banks, six are State Owned Commercial Banks (SOCBs), two are Specialized Banks (SDBs), 40 are Private Commercial Banks (PCBs), and nine are Foreign Commercial Banks (FCBs). There are also six nonscheduled banks operating in Bangladesh (Bangladesh Bank 2017).

## State of Corporate Governance in the Banking Sector of Bangladesh

Corporate governance practices are quite unknown to most companies and organizations in Bangladesh. In fact, Bangladesh has lagged behind its neighbors and the global economy in corporate governance. A survey-based study conducted by the Centre for Policy Dialogue, a research organization of Bangladesh in 2003, found that many companies don't even understand the idea of corporate governance (Rahim and Alam 2014). The current system in Bangladesh does not provide sufficient legal, institutional, and economic motivation for stakeholders to encourage and enforce corporate governance practices; hence failure in most of the constituents of corporate governance is witnessed in Bangladesh. Poor bankruptcy laws, no push from the international investor community, limited or no disclosure regarding related party transactions, weak regulatory system, general meeting scenario, and lack of shareholders' active participations are some of the individual constituents of corporate governance in Bangladesh (Ahmad and Yusuf 2005). The discussion of corporate governance came in the forefront after the first stock market scam in 1996 in the country. Along with other financial institutions, the World Bank encouraged Bangladesh to adopt internationally accepted standard of corporate governance practice (Rahim and Alam 2014). From then, the practice of corporate governance started.

The concern of practicing corporate governance within the banking sector of Bangladesh became a vital issue after the loan scams of three state-owned banks, Sonali bank, Janata bank, and BASIC bank, in the 2010s. Between 2010 and 2012, one branch of Sonali Bank alone illegally gave out taka 45 billion in loans, including nearly 34 billion to Hallmark Group, a textile business entity who issued fraudulent letters of credit to fictitious companies. Another state-owned Janata bank has provided loan and banking facilities worth taka 55 billion to a single borrower, AnonTex group, in 6 years, 2008–2014, which was double its paid-up capital. Another state-

owned BASIC bank was involved in similar loan scam worth taka 45 billion. In another occasion a business entity, Bismillah Group took around 11 billion from five banks both private and public – Jamuna bank, Janata bank, Prime bank, Premier bank, and Shahjalal Islami bank – between 2011 and 2012, which became unrecoverable later (Prothom Alo 2018). As per the report of the Financial Institutions Division of the Ministry of Finance, Government of Bangladesh, the nonperforming loans in six state-owned commercial banks – Sonali, Janata, Agrani, RupaIi, BASIC, and BDBL – stood at taka 34,581 crore or 27% of the overall loan portfolio till June, 2017 (New Age 2017). Inefficient fund management, loan sanction for the political purpose, and social and economic responsibility compelled them to fall in this situation, said the Bangladesh Bank (Mahmood and Islam 2015).

The reasons identified behind these irregularity in the banking sectors are political appointment of board of directors, corruption and irregularities within the board of directors, lack of governance, weakness in management of the bank, lack of supervision, weakness in internal oversight and control, collusion of some insiders in the bank with outsiders, interference of officials with political affiliations, inability to face political pressure, lack of supervision, lack of competence in documentation, lack of skilled audit, faulty field survey, irresponsible lending practice, activities of government-supported Collective Bargaining Agent (CBA) leaders, lack of disclosure about financial transactions, unwillingness to take action, failure of policy direction, greed, forgery, and corruption.

All these are the questions of lack of or inadequacy of corporate governance. Because, inadequate corporate governance arrangements within the banking systems is believed to include inadequately qualified and experienced bank directors and directors with significant conflicts of interest; insufficient understanding of the nature of banking risks by a bank's directors and senior management; inadequate representation of nonexecutive and independent directors on the board; inadequate risk management systems, lack of internal controls and internal audit arrangements; insufficient accountability of directors; lack of transparency; nondisclosure tendency; inadequate oversight of senior managers by boards of directors; poor quality financial reporting to the board; and insufficient rights for shareholders. Alam and Akhter (2017) opined that such fraudulent activities actually indicate the lack of corporate governance practices in the banks. They further avowed that these financial crises have highlighted the needs of corporate governance to restore trust in banking industry of Bangladesh.

This is not the only picture of the public banks. Private commercial banks also lag behind in practicing corporate governance in Bangladesh. Salehuddin Ahmed, ex-governor of Bangladesh Bank, avowed that from the Board of Directors to the management group to the lower level officials, state-owned banks have not shown any sign of good governance, transparency, and accountability and the disturbing fact is that these irregularities have permeated to private commercial banks as well. In his words, one of the main challenges for the banking sector is to ensure good corporate governance which will benefit the depositors, borrowers, and investors; expand potential markets; broaden ownership; create alternative financing options; accelerate growth; increase employment; and help reduce poverty in Bangladesh (Daily Star 2015). There are various reasons behind the absence of corporate governance such as mostly family-oriented companies; motivation to disclose information and improve governance practices by companies is felt negatively; there is neither any value judgment nor any consequences for failure in complying corporate governance practices (Mahmood and Islam 2015). Realizing the necessity of corporate governance in the bank management, the central bank of Bangladesh also urged for ensuring corporate governance within the bank management and suggested that a bank should be comprised with competent and professionally skilled persons with a view to formulating policy-guidelines and supervising business activities of the bank efficiently, as well as ensuring good governance in the bank management (Bangladesh Bank 2014).

Although there are guidelines on banking corporate governance by the Banking Companies Act 1991, by the Bangladesh Securities and Exchange Commission (BSEC) and by the central bank through circulars at different times, they are not working as they are not being in the same line and sometimes are being contradictory with each other. So the first thing which needs to be done is the adoption of a unique guideline on corporate governance in banking sector. Some other specific steps which needs to be taken for ensuring good corporate governance in the banking sector of Bangladesh are people who have experiences in finance, economics, management of financial institutions and people who are not involved directly in politics, not loan defaulters and people with honesty and integrity, should be nominated to the boards of all the state owned banks as well as in the private banks; the regular audit teams, special audit teams, and supervision teams of all the government, nongovernment, and specialized banks should be trained up; independent external auditors should be hired by banks to get better insights into the state of affairs for audit; there should be functional board committee on working corporate governance within the bank; the control and monitoring system of the Bangladesh Bank should be further strengthened and coordinated; and timely action without fear of any political and external influence against the perpetrators should be taken by them.

## Conclusion

Though the concept of corporate governance is not a new one, giving significant importance to it is a new trend which started from some economic crisis within the developed countries of the world. Accordingly, there are a considerable number of researches conducted on corporate governance within the developed countries' context, but in emerging economy of the developing countries there is still a dearth of study on corporate governance and its effect within the economy (Shleifer and Vishny 1997; Denis and McConnell 2003). However, from the few studies found in this area, it is evident that corporate governance is must for the smooth running of any institution as a whole. This is also true in the case of banking sector of Bangladesh which is shattered with the allegations of mismanagement especially in the public banking sector. The banking sector is extremely lagging behind in practicing corporate governance in spite having direction from the controlling authority (central bank of the country). This is creating a serious disruption over the whole economy of the country as banking sector is the life blood of the economy. So, concerted effort from all concerned quarter is a must for establishing a good corporate governance mechanism within the banking sector of the country.

## Synonyms

Business sustainability; Family dynamics; Family FIRO Theory; Family systems theory; Venture creation

## Introduction

Families and entrepreneurial processes have always been essential, interwoven building blocks to the development, maintenance, and sustainability of societies. Throughout history, the connections between families and entrepreneurship have been present and these connections continue today. Worldwide family entrepreneurship existed in ancient biblical communities and their commerce as well as has ***always*** provided economic and social lifelines to families and their communities (Bible 1978, Genesis, 41: 46–57 and 47: 13–26; Hareven 1982).

The family is a primary social entity whose functions are, in part, to procreate, protect, socialize, and produce (Ponzetti 2003). Family emerges from dyads of individuals and, culturally, is defined by various groupings of those individuals and dyads. Families organize in groups which, in turn, lead to commerce within their family in coordination with other families. These entrepreneurial families undergird the functioning of the community in which they live and interconnect commercially with other communities near and afar. Thus, scholars have declared such behavior within families as entrepreneurial and fundamental to the forming of a family firm, namely, family entrepreneurship.

Family entrepreneurship is composed of processes that occur in two interconnected systems. Although the business enterprise is vital to the long-run sustainability of the family firm, the family is of ***equal*** importance to the same (Danes et al. 2008; Danes and Brewton 2012; Stafford et al. 1999; Zachary 2011). The family facilitates and creates entrepreneurial behavior through a myriad of inimitable attributes, behaviors, and activities such as, family spirit, shared values, shared vision, trusting and cooperative family relationships, among others (Mishra and Zachary 2014). These family contributions are critical to the success of entrepreneurial endeavors whether those endeavors are creating a completely new business or developing entrepreneurial innovations in established businesses to maintain their viability over time.

Undergirding the family behaviors and relationships that create and facilitate these entrepreneurial endeavors are emotions that enhance or constrain the entrepreneurial decision-making process. Emotions are experienced within individuals and transmitted to others through behaviors that are observable expressions of those internal emotions. A key component of family entrepreneurship is a recognition of this **family emotion/behavior duality** and its effect on the development, effectuation, maintenance, and sustainability of entrepreneurship. This emotion/behavior duality has been the "omitted critical connection" in entrepreneurial new business creation and entrepreneurial innovation's role in business sustainability over time.

To date, the literature has primarily focused on the "who" and "what" of entrepreneurial decision-making, namely, primarily the entrepreneur and his/her decision content, that most likely produces the outcome of successful entrepreneurship. The "omitted critical connection" between the "who/what" and the decision outcome has been the "how" which are the decision processes of the emotion/behavior duality that is the bridge between the "who/what" and a successful family entrepreneurship outcome. As a result, the complexity of family entrepreneurship has been mystifying and confusing. That has occurred because little recognition or empirical investigation has been given to the fact that owning and operating a business might affect the lives of the owning family and their family members. That is especially important because an entrepreneur's immediate decision context is the family, specifically interactions within the entrepreneurial couple relationships and resource flows between spouses to assist with the liability of newness of a new venture (Danes 2006).

The substance of this **emotion/behavior duality** as it is executed in families is the focus of this entry. Very little has been written about the systemic interactions that are the essence of that important aspect of family entrepreneurship. This emotion/behavior duality is discussed relative to both starting a new entrepreneurial endeavor and introducing a new entrepreneurial innovation within an established business.

To do so, two unique approaches are used. All the empirical work using a data set of couples who started a new venture is organized in a systematic manner. This approach depicts the couples' interactional behavior that contributes/constrains entrepreneurial achievements. Then observational techniques using reliable and valid interaction scale coding elucidates the emotion/behavior duality in patterns of communication, negotiation, and influence strategies as established family enterprises proceed through an entrepreneurial innovation process.

Family entrepreneurial resources are generated, nurtured, maintained, and reconstructed over time within various subsystems within families. Kepner (1983) first identified three main family subsystems including: (a) spousal; (b) parental; and (c) siblings. The spousal subsystem serves the personal and interpersonal needs of the partners as well as forms the leadership for the family. The parental subsystem creates and develops offspring and monitors the individual needs of each sibling and possible sibling conflicts. The sibling system serves as the basis for learning among brothers and sisters, and that system also often serves as the milieu for competition among siblings for parental attention and approval. Although the spousal or couple subsystem within the family is the major focus of the entry, discussions will be offered relative to

the emotional dimensions within the family firm as well as the parental and the sibling subsystems.

Classical family systems theory (Bowen 1985) developed from clinical work with actual families without recognizing or empirical investigating whether owning and operating a business might affect the lives of the owning family and their family members. Subsequently, Cramton (1993) recognized that family members, including spouses, were involved in their family's firm and deserved attention and study via systems theory and specifically the application of family systems theory.

This entry takes a "deep dive" into the couple decision-making context within the venture creation process. The decision context is seasoned with a myriad of emotions that must be traversed in moving forward toward mutually shared decisions. This mutually shared decision context provides an adaptive capacity to address the liability of newness that emanates from the decision to create a new business. Adaptive capacity is the ability to adjust resources and interpersonal processes to respond to change (Danes 2006). Couple interaction processes such as communication and decision-making processes are the essence of the adaptive capacity of couples to start a new venture (Hedberg and Danes 2012).

This adaptive capacity is grounded in the flexibility and resiliency of the couple relationship; these characteristics are salient factors in initiation, growth, and continuity of the new venture. As the new venture is formed, a couple's adaptive capacity can be drawn upon to access and use the family capital stock (i.e., social, human, financial) to facilitate adapting and functioning competently, leading ultimately to new venture sustainability. This adaptive capacity facilitates resource transport across family/business boundaries during change while maintaining boundary integrity (Danes 2016).

## Understanding Family Entrepreneurship Conceptually

To more fully understand the complexity of the family entrepreneurial processes, both decision content and interactions within the decision process of the owning family are essential to consider. To achieve entrepreneurial goals, that understanding needs to occur in both family and business systems. Three theories are discussed to assist in that understanding. Each of these theories plays a significant role in understanding family entrepreneurship. The Sustainable Family Business Theory (SFBT) is an overarching systems theory that provides a systems' view of the complexity of the entrepreneurial process over time. It is patterned after classical systems theory. The Entrepreneurial Value Creation Theory (EVCT) specifically targets stages in the creation of an entrepreneurial endeavor. The Family Fundamental Interpersonal Relationship Orientation Theory (Family FIRO) focuses on the emotion/behavior duality that undergirds the entrepreneurial decision-making process, the "omitted critical connection." The discussion will begin by comparing the inner workings of SFBT and EVCT.

**Sustainable Family Business Theory**. First, propositions from SFBT (Danes and Brewton 2012) are presented. SFBT gives equal weight to family, business, and their interface to illustrate patterns of couple resource use and interpersonal processes at the intersection of family and business systems that lead to sustainability of the new venture.

The SFBT is unique among the family firm theories that have emerged to date with its assumptions as follows:

1. Two dimensions: family system and business system
2. Family is ***equal*** to business in detail and importance
3. Both family and business are social systems which are purposeful and rational
4. Both family and business use available resources and recognize constraints
5. Both family and business transform available resources and constraints via interpersonal and resource transactions into achievements
6. Achievements are both objective and subjective
7. Both family and business are affected by environmental change and structural change

8. Interface system varies as well as the divergence of goals and achievements
9. Change requires reconstruction of resource allocation in family and business systems

SFBT provides clarity to a family firm's complexity by establishing a comprehensive view of transactions needed to achieve long-term sustainability and by providing a clear picture of family and business systems as well as the internal dynamics of family entrepreneurship over time.

**Entrepreneurial Value Creation Theory**. The Entrepreneurial Value Creation Theory (EVCT) developed by Mishra and Zachary (2014) posits that venture creation processes can be led by an individual and/or involve a team of individuals. The EVCT is a two-stage value creation and appropriation framework consisting of venture formulation and venture monetization, respectively. External stimuli of either entrepreneurial intention or opportunity set in motion Stage 1-Formulation. Starting with ***either*** instigating force, the entrepreneur internalizes an opportunity with their available resources, including human and family resources and enters an ongoing process of effectuation. Over time and in a repetitive fashion, such a process assesses and aligns available resources for the chosen entrepreneurial opportunity balanced with intention.

The result is to create the critical element of entrepreneurial competence. That competence is developed in Stage 1-Formulation and propels entrepreneurs into Stage 2-Monetization. During monetization, family resources of all kinds may come into play and provide financial support to the chosen entrepreneurial path, entrepreneurial reward, and sustainable value. Thus, in the case of family entrepreneurship, family resources and interactions play a vital role throughout venture formation as well as in obtaining financial support.

**Comparison of SFBT and EVCT**. The SFBT posits a comprehensive view of the family business setting by providing a clear picture of the family system, the business system as well as the interface system. The SFBT is focused on change relative to the internal dynamics of family entrepreneurship in the short-run and long-run with the community. It offers equal consideration of the family, business, and interface systems as well as attention to family capital regardless of what system or when it comes into play, meaning times of stability or change. The creation, emergence, and management of a new venture occurs in the family/business interface subsystem.

Further, the SFBT encompasses all stages of business development from emergence and maturing relative to the short-run and long-run whether within or across generations. Any and all family members can be considered using SFBT, namely, couples, children/siblings, or other relatives while considering the relational processes and interpersonal transactions between and among these members as well as business sustainability over time.

Compared to the SFBT, the EVCT emphasizes the role of the entrepreneur in creating value while allowing for the involvement of family members both in formation and monetization. The EVCT can engage multiple entrepreneurs such as couples or a team of family members who may also be involved in the entrepreneurial processes. Family members can be directly involved in the entrepreneurial value creation or be of the support structures within the near environments.

The EVCT describes an overall process similar to the SFBT but differs in its respective components. For example, the EVCT's formulation stage encompasses the development and expression of intentions as well as the identification and development of opportunities. Next, the EVCT posits how intentions and/or opportunities are combined with resources throughout a reoccurring effectuation process yielding entrepreneurial competence. Further, in the monetization stage, attracting investors including family sources, and mobilizing these investments occurs. Finally, this new venture creation process is nestled with the near environments including networks, alliances, and communities. Opportunities can be explored through building prototypes of new products and/or identifying exemplars new services or new markets.

In sum, researchers could choose either the SFBT or the EVCT depending on research goals. The relative comparative advantages of the SFBT are the internal dynamics of the family firm and its three subsystems: family, business, and interface. The SFBT allows the focus on change leading to short-run viability and long-run sustainability. On the other hand, the EVCT's comparative advantage is the singular focus on the value creation process within the formulization and monetization of a new venture or the regeneration of an existing venture.

However, neither of these two theories addresses in any detail about the emotion/behavior duality of entrepreneurial decision-making within family enterprises. Although the SFBT addresses interpersonal processes within the family, business, and interface systems, it does not delineate specifics about the interaction processes that lead to business achievements. Neither does the EVCT indicate the specific interactions of family members within its formulation and monetizing stages. Family FIRO Theory is imperative to investigate the emotional/behavior duality at both theoretical and observable levels.

**Family FIRO Theory**. Family FIRO (Fundamental Interpersonal Relationship Orientation) Theory (Hedberg and Danes 2012) is a conceptual and working model about interpersonal dynamics and change and provides a theoretical structure for understanding the complex emotion/behavior duality involved within decision processes of starting an entrepreneurial endeavor. Family FIRO Theory is composed of three conceptual dimensions: inclusion, control, and integration.

The **inclusion** dimension of the Family FIRO Theory is about structure, connectedness, and shared meaning. It is about roles held, who is included in the new venture and at what levels, and decision-making structure. The **control** dimension reflects communication patterns, negotiations, and influence strategies. It reflects the interactional components that are the essence of decision processes. The interactional content of these strategies is delineated in this entry. The components further reflect the resilience process of the adaptive capacity grounded in the couple relationship. The **integration** dimension reflects outcomes characterizing variant levels of couple unification and firm success.

Per Family FIRO Theory, two propositions apply when families face major change. First, their patterns of **inclusion, control, and integration** require reconstruction. Second, embedded in the model is an optimal sequence for managing change. Doherty et al. (1991) suggests that inclusion is the sine qua non for successful management in the control and integration dimensions. Without effectively addressing inclusion issues, control dynamics cannot be adequately addressed and, thus, efficacious integration is precluded.

Since emotions undergird behaviors, emotions are central to how entrepreneurial decision processes function within family entrepreneurship endeavors. Emotions are an internal resource within individuals that when experienced can be expressed through either instinctive or intentional behaviors. Emotions and the thoughts that are interconnected with them are only observable as they are acted out through behavioral interactions with others. As such, emotions affect decision-making processes within blurred boundaries between family and firm. It is through this indirect, illusive manner that interactional behaviors that emanate from emotional resources play a central role in the sustainability of entrepreneurial endeavors.

**Emotional Dimensions**. Emotions are inherent in all human endeavors including entrepreneurship. Some emotions such as entrepreneurial passion provide strong motivational pulls on the entrepreneur and his or her family and its members. However, some emotions contribute a negative drag on individual family members and the family system. Resentments and feelings of unfair treatment may cause internal behavioral conflict and could represent an internal threat to the entrepreneurial venture. Further, stability of the family system may be compromised. Hence, entrepreneurial and family firm scholars have begun to investigate the nature of emotions.

Although emotions cannot be directly measured, there is an emotional-behavior duality in

that behaviors are motivated by underlying emotions. In other words, behaviors that undergird emotions can be observed and analyzed via observational research (Melby and Conger 2001). Emotional interactions are often found to be contagious, particularly within groups and families (Schoenewolf 1990). Those emotional responses may have either positive or negative outcomes. Labaki et al. (2013a, b) have identified three family firm archetypes relative to emotional characteristics: (1) **enmeshed**; (2) **disengaged**; and (3) **balanced**.

Although **enmeshed** family firms demonstrate high levels of cohesion, this may be at the expense of individual differentiation, self-expression, and adaptability. This archetype has engaged high levels of emotional capital and transfers emotions from family system to business system and the reverse. Further, emotional norms are mixed between systems and demonstrates a sense of collectivism, harmony, and loyalty, possibly at the expense of needs/wants of individual family members.

On the other hand, **disengaged** family firms manifest the opposite characteristics of enmeshment. In this archetype, individuals are predominant relative to the group and are often not involved in the family firm such that these boundaries are rigid and segmented. As a result, the disengaged archetype has low cohesion and is overly flexible to adaptability and change. This archetype utilizes low levels of emotional capital with no exchange between family and business systems and each has its own emotional norms. The nature of this archetype is individualism with self-expression governing interactions among family members.

The **balanced** archetype is the preferred situation where boundaries are clear and demonstrate a moderate level of closeness and separation among family members. This archetype utilizes medium to high levels of emotional capital with balanced exchange between systems and balanced norms shared by the two systems. The nature of this archetype is balance between both individualism and self-expression. Clearly, the balanced archetype provides the best setting for achieving goals for both the family system and the business system simultaneously.

## Behavioral Interactions in New Venture Creation Based on SFBT and EVCT

This section of the entry discusses the findings from a longitudinal study at launch and one year later, as well as multi-informants of the entrepreneur and spouse, and multisystem, namely, the family and business, data sets of couples who have started a new business venture. The data set includes variables about structure and processes in both family and business and contains subjective and objective measures of success for family and business. The data set is composed of 109 couples who started a new venture; 52% of the entrepreneurs were male and 48% were females. Further descriptive details about the sample can be found in Danes et al. (2010).

By investigating one data set in depth and viewing the couples from a number of angles, we are able to capture a more systemic view of the emotion/behavior duality as it operates within the family entrepreneurial decision-making process. To date, the complexity of that reality has not been captured nor explored. The SFBT's clearly delineated propositions are used to organize this section because of the theory's giving equal weight to family, business, and interface systems. EVCT is used to further clarify specific points because of its specificity in elucidating the iterative effectuation process of entrepreneurial endeavors.

Due to the bonds of marriage, spouses become critical stakeholders in a new venture, providing resources to entrepreneurs as well as the business. Moreover, business-owning couples are distinct from business partners who are not in an intimate relationship because of the nature of their couplehood which envelops a stock of relationship capital. McGovern (2011) defined "couplehood" as relationships between two committed individuals who share a sense of identity, commitment, and purpose that creates a high level of trust between entrepreneur and spouse as well as may contribute to venture creation in important ways. For example, contributions might include such resources as financial capital from family savings, social and emotional capital needed to compensate for the extensive start-up time and

energy demands, and human capital such as business or management expertise.

**Proposition 1 Patterns of resource and interpersonal transactions in business and family during times of stability create a resiliency that serves as a foundation for addressing stresses during times of change**.

The EVCT indicates that any family members can engage in the formulation and monetization stages of new venture creation. Couples who start a new entrepreneurial endeavor provide each other with important support and adaptive capacity relative to developing intentions and opportunity recognition as well as contributing their combined resources, especially emotional support. These advantages can enhance the couple's effectuation process which is inherently a process of change leading to the development of their combined entrepreneurial competence. In turn, the couple's chance of attracting investors, both family and nonfamily, is enhanced.

Entrepreneurial endeavors have an impact on family finances and the couple relationship dynamics. Thus, the expectations of both the entrepreneur and spouse are critical to consider in the decision-making process (Craft et al. 2015). Expectations differ by gender. Female entrepreneurs and female spouses were more optimistic about the impact of the new venture on their relationships than their male counterparts. Male entrepreneurs expressed a greater degree of optimism about the effect on family finances compared to their female counterparts whereas the reverse was true for the spouses. Female spouses expressed greater optimism about the effect on finances than did male spouses.

The relationship of these expectations and provision of social support is complex (Danes et al. 2012). It is complex because it is not just provision of social support that is critical but effectiveness of the provision (Beach and Gupta 2006). Social support, measured by concepts of nurturance and affiliation, differed by entrepreneur's gender. The nurturance concept reflected denseness and multiplicity of supportive behaviors. Affiliation reflected the extent the entrepreneur believed his/her needs for info, feedback, and material aid were being filled.

Male spouses of female entrepreneurs reported giving more nurturance than female entrepreneurs reported receiving. For affiliation, although both entrepreneur types indicated that they can discuss business issues openly, they did not rely on spouses for business advice. Male entrepreneurs reported their affiliation needs were met more frequently by their spouses then did female entrepreneurs. One reason for this finding is that slightly more than half of female spouses of male entrepreneurs worked in the new venture. Male spouses of female entrepreneurs reported being more sensitive to needs of female entrepreneurs than they perceived.

Resiliency of entrepreneurial couples is based in the characteristics of each individual and spousal resources that emanate from the couple relationship (Yang and Danes 2015). Spousal commitment to new venture goals acts as a protective mechanism and traverses the family/business boundary through the entrepreneur's appraisal of interactions within the couple's decision context. These resources affect outcomes differentially depending on whether the focal outcome is an objective or subjective in nature.

For example, spousal commitment (negative) and business demand (curvilinear) were significantly associated with breakeven point. Entrepreneur's business confidence (positive), life outlook (positive), and business demand (curvilinear) were associated with the business success. These findings indicate why it is important to take a more inclusive view of the components of sustainability because the two measures had different predictors, but the predictors of both success measures interact in a process of resilience to adapt to the challenges of venture creation.

**Proposition 2 After change, business and family systems exchange resources at their boundaries and processes must be reconstructed to ensure sustainability over time**.

The EVCT focuses carefully on the effectuation process within the formulation stage. This

process can iterate over time and reconfigures the intentions, opportunities, and resources to yield entrepreneurial competence relative to the couple in this case. Effectuation inherently encompasses change and reconstruction of stability over time. This is also vital to attract funding leading to stability in the long run.

There is a sequential relationship of couple goal congruence (e.g., couple and financial), new venture-related communication, and new venture viability (Jang and Danes 2013). Couples having mutual agreement about their family and business goals will more likely try to find ways to achieve those goals together. Quality communication about business goals helps couples develop standard operating procedures for managing family and business. Although much is known about how entrepreneurs form their identity, we know little about how entrepreneurs and their spouses mutually form a collective, copreneurial identity. An entrepreneur's decision to launch a new business depends not only on opportunity analyses but also on the degree that an entrepreneur's spouse shares a common vision about firm goals (Van Auken and Werbel 2006). Danes and Jang (2013) investigated the formation of a copreneurial identity during new venture creation by investigating underpinnings of spousal commitment.

Entrepreneurs reported spouses having high commitment prior to business launch, but spouses reported they were more committed than reported by entrepreneurs. Spousal commitment to entrepreneurial endeavors influences entrepreneur's attitudes, resources, and motivation toward the firm fueling the entrepreneur's energy to facilitate firm success. However, Kirkwood (2009) indicated that female entrepreneurs tend to gain their spouse's commitment before starting the new venture whereas male entrepreneurs do not.

Links between spouse's pre-launch self-assessment of commitment and entrepreneur's assessment of spousal commitment one year after launch differed by business communication quality. Pre-launch spousal commitment self-assessment was positively related to entrepreneur's appraisal of spousal commitment one year after launch only for the high business communication group. For that group, entrepreneur's assessment of spousal commitment over time was composed of spouse's self-assessment of commitment and entrepreneur's appraisal of spousal commitment, reflecting the mutual verification of copreneurial identity.

**Proposition 3 Conflicts arise when there is a mismatch between demands and resources**.

Business demands often represent the greatest threat to work-family balance during venture launch (Danes 2016). In the discussion of demands and resources of venture start-ups, two streams of research exist in the entrepreneurship literature relative to spouses of entrepreneurs. One stream indicates that simply having a spouse is an important resource to new venture creation because of the human and social capital that they bring to the table (family adaptive capacity); drawing from this capacity will likely increase probability of survival and also assist in identifying, accepting, and resolving differences (Stafford et al. 2013). On the other hand, another stream suggests that spouses may be a liability and that work-family conflict becomes a constraint for married entrepreneurs because couple and family relationships need to be maintained and can add further demands. Continuous long working hours in the new venture depletes energy available for other domains in life (including self and family).

Werbel and Danes (2010) contributed insight into the controversy by investigating the moderating effects of spousal commitment on new venture viability. Their findings indicate that when a spouse experiences work-family conflict, a spouse is likely to be a resource constraint to the entrepreneur that results in physiological strain. Furthermore, spousal commitment to the new venture is likely to exacerbate the situation. Thus, work-family conflict has a doubling effect. Starting a new business is already stressful in many ways (direct effect) but there is potentially an indirect effect in that spousal strain is likely to exacerbate an entrepreneur's strain.

However, Gudmunson et al. (2009) discovered an important mediator that affects the complex dynamics of work-family balance. Those authors

examined whether emotional support contributed to entrepreneurs' work-family balance. They found that reports of spousal support given were strongly related to reports of support received, suggesting genuine interpersonal transactions of support. They, however, also found that the effects of spousal support were confounded until a satisfaction-with-business communication variable was introduced, revealing competing direct and indirect effects on work-family balance.

Satisfactory business communication is critical because emotional support can have a contagion effect due to a time-limited effect of emotional support (Hobfoll and Sprielberger 1992). For example, if a business problem persists for a long time, an entrepreneur could begin to feel they are not meeting spousal expectations. In this instance, the spouse's emotional support could leave the entrepreneur feeling anxious that the firm is not doing as well as expected. Notably, the emotional dimensions and health of the family system overall is related to emotional states of all family members with each other dyadically as well as how family functions together as a group.

Quality/productive communication emanates from the emotional foundation of adaptive capacity resources. But we do not know the consistency of that emotional foundation that is so critical to tapping the store of adaptive capacity to combat the liability of newness of venture creation. The next section provides insight into this emotional foundation and behaviors associated with family interactions based on that emotional foundation.

## Exploring Emotion/Behavior Duality Using Family FIRO Theory

This section represents the "deep dive" into the entrepreneurial couple decision-making context. That "deep dive" was facilitated using exploratory observational data that allowed us to discover patterns of interpersonal transactions and the resulting emotional/behavior duality. The study helps us understand dynamics that undergird the development and maintenance of adaptive capacity stores within entrepreneurs. Because the Family FIRO Theory's focus is interpersonal dynamics and change, it is a useful framework to understand business owning couple dynamics around reconstruction of resource allocations when introducing an innovative entrepreneurial endeavor into an established business.

Observational methodologies are often used in social, behavior, medical, and family sciences as a means to assess and understand ongoing behavioral relationships (Caughlin and Basinger 2016). Ratings of larger segments of behavior by unbiased and well-trained outsider assessment of interactional relationships such as those in this study have been shown to be both reliable and valid (Melby et al. 1995). Since interrater reliability is critical in coding observational data, the coders were provided with a week of training. However, the nature of the task presented to the group to be discussed is critical if the objective is to capture the overall gestalt of the family interactions, both positive and negative and their reciprocity. A problem-solving task will elicit primarily negative interactions whereas a business discussion task such as that posed in this study would provide opportunity for expression of a greater variety of emotions and behaviors motivated by those emotions (Melby et al. 1995).

Businesses for this exploratory observational study came from a large longitudinal, quantitative study of established businesses. A smaller subsample (22 family businesses) was randomly selected from this larger study to participate in this qualitative, observational study. Since businesses were asked to discuss a planned major change that they had identified earlier in the study, they were asked to self-identify the business decision team. That decision team was then videotaped discussing the business change. For simplicity of presentation and understanding, only businesses where the decision team was identified as the owning couple was included here. The sample was composed of 13 of the 22 family businesses subsample. The interactions between the couple were then coded for a number of components of interaction dynamics that reflected the nature of the resources and interaction dynamics of the family as exhibited within the decision context of the major change discussion.

This research used interaction scales and a coding scheme for the interaction scales from the validated Iowa Family Interaction Scales (Melby and Conger 2001). When people interact with each other, they communicate through speech as well as through their tone of voice, facial expression, eye contact, and body position. All these verbal and nonverbal cues combine to influence messages and emotions relayed, all of which contribute or detract from the entrepreneurial couples' adaptive capacity. Ultimately, the sustainability of the new venture is affected by these couple interactions because of their impact on the decision context and problem-solving capabilities that evolve from that context.

**Role and Decision-making Structures Representing Inclusion Dimension**. Since inclusion is the sine qua non for successful management in the control and integration dimensions in the Family FIRO Theory, entrepreneur and spouse responses were compared on role in the business and couple decision hierarchy within the business to develop three groups of venture decision-making structure styles reflecting the inclusion dimension: **Collaborators, Consulting Leaders**, and **Independents**. Within the **Collaborators** (3 of 13 couples) style, entrepreneur and spouse had equal business roles and decision authority in final decision-making. Within the **Consulting Leaders** (3 of 13 couples) style, entrepreneur and spouse had equal business roles; in this style, the spouse was an active participant in the decision-making process but the entrepreneur had final decision-making authority. Within the **Independents** (7 of 13 couples) style, the spouse performed little or no business work and the entrepreneur is the one "in charge" in that there is little to no involvement of others in the decision-making process.

To further describe the **Independents**, this group will be divided into **Independents A** (3 of the 13 couples) and **Independents B** (4 of the 13). The females work involvement in **Independents A** entailed performing the financial record keeping and communicating with employees. The females in **Independents B** were much less involved in business work although they periodically ran business errands or did some of the daily work tasks. The decision-making involvement of females in this group was not well defined; it varied by circumstances determined by the male final decision maker.

**Observed Interaction Patterns Representing Control Dimension**. The control dimension reflects communication patterns, negotiations, and influence strategies. To capture these patterns, the dyadic interaction scales assessed behavior of a focal person toward a specific interactor – in this case, the entrepreneur and spouse and vice versa. These scales tap both verbal and nonverbal behaviors and affective and contextual dimensions of interactions that are difficult for participants to assess objectively.

Relative to coding interactions, coders were trained to place strong emphasis on emotional affect and focus on ways that messages were conveyed, with less emphasis on the message's verbal content. Specific attention was placed on facial expression, voice, and body posture. Each rating scale consisted of five pieces of information: behavior frequency, behavior intensity, affective (emotional) tone of behavior, context in which behavior occurred and proportion of interaction displaying behavior. The coding objective was to capture complexity and texture of interaction rather than to classify interactions. The general coding scheme for behavioral scales was based on a "1" to "9" scale. Scale descriptors were 1 = "not at all characteristic," 3 = "minimally characteristic," 5 = somewhat characteristic," 7 = "moderately characteristic," and 9 = "mainly characteristic."

What follows are the interaction coding categories and definitions. These couples were discussing a major business change they planned. The scales assess ongoing behavioral relationship processes; the coding scores provide a relatively unbiased outside assessment of the relationship (Melby et al. 1995).

**Listening Responsiveness**: the focal person's nonverbal and verbal responsiveness as a listener to the verbalizations of the interactor through behavior that validates and indicates attentiveness to the speaker.

**Assertiveness**: the focal person's ability, when speaking to express self through clear, appropriate, neutral, and/or positive avenues using an open, straightforward, confident, nonthreatening, and non-defensive style.

**Communication**: speaker's ability to neutrally or positively express his/her own point of view, needs, wants, etc. in clear, appropriate, reasonable, means to demonstrate consideration of the other interactor's point of view.

**Dominance**: attempts to control or influence (either positively or negatively) another interactor or the situation.

**Power**: extent to which the focal successfully influences or controls (either positively or negatively) another interactor and/or situation.

**Negotiation/Compromise**: willingness to settle differences by arbitration or consent reached by mutual concession.

**Entrepreneurial Outcomes Representing Integration Dimension**. Integration is represented by the achievement of business profit and viability goals as assessed by both members of the couple. Both goals were assessed on a 5-point Likert scale, where "1" indicated that very little had been achieved toward the goal and "5" indicated that it had been achieved almost entirely.

**Couple Interaction Patterns and Associated Venture Achievements**. Interaction patterns of **Collaborators** reflected a strong adaptive capacity to address the effectuation process. They exhibited a foundational base of productive couple social capital resources which they drew upon as they executed their planned business change. Two of the three Collaborator couples scored high on listener responsiveness, assertiveness, and communication-behaviors critical to their shared business decision-making status. These high scores coincided with mid-range dominance and power scores.

These two couples demonstrate the balanced emotional archetype described earlier in this entry. They demonstrated a level of emotional capital that resulted in a balanced exchange of resources between family and firm. These two couples rated the highest within the **Collaborators** and across all the couples on achievement of profit and viability goals. As indicated by Labaki et al. (2013a, b) and demonstrated by these two couples, this balanced emotional archetype provides the best setting for achieving goals.

The third couple of the **Collaborators** scored lower than the other two in this group on listener responsiveness and assertiveness and higher on dominance. This couple also reported lower profit and viability scores then the other two couples in this group. Despite these score differences, all three couples who were **Collaborators** scored high on negotiation/compromise, namely, the willingness to settle differences by arbitration and mutual consent.

An explanation for this occurrence comes from Gottman and Levenson (2000), a well-known family researcher on couple conflict. They indicate that the fact that there are couple disagreements is not as much an issue as the ratio of positive to negative interactions over time. All of the couples who were **Collaborators** exhibited a ratio where the positive interactions outweighed the negative ones. The interaction patterns of the Collaborators are also consistent with Gudmunson et al.'s (2009) quantitative finding that the relationship between spousal support for the new venture and work-family balance was confounded until satisfying business communication was introduced into the equation. The satisfying communication that these couples exhibited balanced off the differences that they indicated they had about the business change.

The couples in the **Consulting Leaders** group had slightly lower reports of goal achievement for profit and viability compared to couples who were **Collaborators**. The scores for listener responsiveness, assertiveness, and communication were generally high except for one couple where the score for listener responsiveness for the female was quite low and the couple scores for assertiveness and communication were lower than for the other two couples. Based on these scores, it is not surprising that the dominance scores for this couple were higher and the score for negotiation/compromise was lower for this couple compared to the other two couples.

The couples who were **Consulting Leaders** had similarly high negotiation/compromise scores as did the **Collaborators**. It is just that they had to work harder to settle differences to reach their shared decisions as reflected in their higher scores on listener responsiveness, assertiveness, communication, dominance, and power compared to the couples as **Collaborators**. When there is a designated final decision maker as in the **Consulting Leaders** group with an active female participator in the decision-making process, there has to be a conscious effort on the part of the females to get their voice heard and a conscious effort on the part of the male final decision maker to hear that voice. That interaction dynamic was visible in the scores of these couples; their scores for dominance and power were higher than those for couples as **Collaborators**. The **Consulting Leader** couples also reflect the balanced emotional archetype, although their behaviors demonstrated a higher level of emotional capital engagement in order to settle their differences compared to the Collaborator couples.

As a group of seven businesses, the **Independents** scored lower in achievement of profit and viability. Listener responsiveness was low for females in the **Independents**. On the one hand, this finding is not surprising since they were either not very involved in the business or they only did bookkeeping and facilitated employee communication. However, the **Independents** had high dominance scores; in the discussion of their business change, there were many attempts by the female to control or influence the male spouse who was described as "in charge." Their knowledge of business finances through their bookkeeping activities gave them knowledge fodder in their minds to justify having an input into plans for the business change even though they did not participate in business work beyond the bookkeeping. Family system resources would be affected by the planned business change which made the females feel that they should have a voice in this business change effectuation process.

What is noteworthy to mention is the dominance scores of the **Independent B** group. Couple dominance scores were high; in all cases, the female of the couple scored higher than the male. These same couples had the lowest negotiation/compromise scores. Of all the couples, they also had quite low goal achievement scores. Influence attempts were about the lack of shared meaning about the business change based on the current business status. **Independent A** group had low listener responsiveness scores for females and high dominance scores but higher negotiation/compromise scores than the **Independent B** group. Even though the goal achievement scores of the **Independent A** group were not high compared to the **Independent B** group, the fact that their listener responsiveness, assertiveness, and communication scores were higher than the **Independent B** group provided them with enough adaptive capacity to more likely settle differences through mutual consent compared to the **Independent B** group.

In comparing the dominance and power scores for the **Independent** group couples to those of the **Collaborators** and **Consulting Leaders** groups, two issues are interesting: (a) the higher variance in the dominance scores between the males and females within couples and (b) the difference between the dominance and power scores for couples. The females in the **Independents** group couples knew that the male was the final decision maker. With this knowledge, they attempted to influence the final decision maker before his final decision was made. These dynamics play out in the negotiation/compromise scores and the levels of profit and viability achievement in that they were lower than for couples in **Collaborators** and **Consulting Leaders** groups. The adaptive capacity of the couples in the **Independents** group was lower due to the lack of flexibility in their resilience processes. Thus, their ability to engage in an ongoing iterative effectuation process was lower.

The **Independents A and B** groups reflect characteristics of the disengaged emotional archetype where individuals are prominent over the group. The fact that the males indicated that they were "in charge" created a lack of openness to ideas other than their own which led to inflexibility in assessing and aligning family resources in the effectuation stage of the business change. The **Independents** groups exhibited positive/negative

interaction ratios that were imbalanced in that there were more negative interactions compared to positive compared to the **Collaborators** and **Consulting Leaders**. These imbalanced interaction ratios resulted in resistance to exchange resources between family and firm systems which ultimately resulted in lower profit and viability goal achievement.

**Summary of Spousal Subsystem in New Ventures**. Businesses in this observational study were organized in three ways: **Collaborators**, meaning equal business roles with shared decision-making, **Consulting Leaders**, meaning equal work roles with male as final decision maker with active participation of female in decision-making process, and **Independents**, meaning males in business role and females with little to no business decision involvement.

**Collaborators** were couples who experienced the highest level of profit and viability goal achievement. These couples' behaviors had good positive/negative interaction ratios indicating that they had more positive interactions than negative ones. Those ratios created both a couple relationship and business partnership with a balance of closeness and separation that resulted in accessing and using resources of both family and business in a productive manner to effectuate the planned business goal.

**Consulting Leaders** couples had the next highest levels of profit and viability goal achievement. These couples utilized more emotional capital then did **Collaborators** couples to reach a shared decision. They had to work more diligently to settle differences because there were greater differentials between their listener attentiveness scores and dominance and power scores were higher than for **Collaborators**. High negotiation/compromise scores were found for the **Collaborators** and **Consulting Leaders** groups. Although the **Consulting Leaders** group had to use more emotional capital to settle differences, their positive/negative interaction ratios favored positive reactions. For these **Consulting Leaders** couples, such a positive ratio was critical for a productive decision-making process that moved them forward with their planned decision change. They had enough stored adaptive capacity within their personal relationship to energize their desire to compensate for the lesser listener attentiveness and higher dominance scores they experienced in their business relationship. This dynamic enabled them to move forward to achieve consensus in the effectuation process of the planned business change.

The **Independents** were in the midrange to lower levels of profit and goal achievement. There were significant gaps between males and females in listener attentiveness compared to the **Collaborators** and **Consulting Leaders**. The dominance scores were higher for the **Independents** compared to the **Collaborators** and **Consulting Leaders** which means there were many more attempts by both males and females to control or influence the other spouse, either positively or negatively. In the **Independents B** group, where the female had little involvement in the business, the negotiation/compromise interaction scores were quite low. Planning for a business change would have consequences for the family system as well as the business system but that fact was not recognized to any extent in this group. Interactions in this group were reflective of the disengaged emotional archetype where individuals are prominent over the group and the family/firm boundaries are rigid. This individualism and boundary rigidity leads to resistance in contributing family resources to effectuate the planned change and weakened the potential of success.

## Parental Subsystem and Sibling Subsystems

Friedman (1991) addresses in-depth the nature of the parental subsystem in tandem with the sibling subsystem and notes that both subsystems are extraordinarily tied to each other. The parental subsystem provides the leadership for the raising of the family's children. Parents provide attention, love, and emotional support to each child. Critical elements of parenting involve methods of relating with each child and are threefold: (a) the recognition of unique attributes; (b) treatment among siblings; and (c) resolution of sibling conflicts.

The sibling subsystem and its inherent sibling relationships among two or more children are important across the individual's life span. Such relationships are often the longest and closest family relationships. Further, the sibling subsystem serves as the first social laboratory of experimentation and can foster a child's individuation and emotional growth. However, abnormal sibling relationships hinder these positives and can destabilize the family system.

Driven by the behaviors of the parents, three elements of the sibling subsystem are impacted by this parental influence: (a) comparisons among siblings; (b) whether siblings are treated equitably or equally; and (c) involvement of parents in sibling conflict resolution. The best outcomes of parental behaviors result when each sibling experiences individuation, equity, and conflict resolution. These positive outcomes allow each sibling to be recognized, treated equitably and fairly, and autonomously. Negative outcomes include stereotyping, unfair equality, and the inability to solve conflicts due to parental interferences.

These negative outcomes among parents and siblings must be repaired or reversed to encourage the acceptance of individual differences, trust, and learning how to collaborate. Further, the positive outcomes between the parental and sibling systems are precursors to the ability to function positively when the children are adults in the firm. On the other hand, the negative outcomes leave both parents and adult siblings unable to function and likely facing sibling rivalry throughout the life span of the family firm and if it survives.

Grote (2003) brings to light Girard's Theory of Borrowed Desire as a means to understand sibling rivalry and its negative effects on the family system overall and the sibling subsystem specifically. Inevitably, individuals and especially siblings may develop jealousy or rivalry. Such emotions of human desire are inherently imitative, namely, an individual desires something that another individual wants. In other words, the desire is borrowed. The success of the sibling subsystem depends on the abilities of siblings to be honest and willing to resolve such jealousies, particularly in the case of fostering entrepreneurial expressions within the family.As with the spousal subsystem, communication is key to productive processes within the parental and sibling subsystems. Kaye (1991) developed his Sustained Conflict Cycle (Equilibration) Model which examines the family dyads and the real roots of conflict as well as posits that family members will sustain conflicts in a circular cycle that reduces too much conflict and also increases too little conflict. Family members may not behave rationally because of their familiarity and commitment with each other. And the goal may be to distract from dealing with the actual conflict, at hand, because of shared fears such as change in business ownership or the impending death of a family member. By openly examining the real concerns of all, family members can break this sustained conflict cycle and allow movement toward meaningful conflict resolution.

## Conclusions, Applications, and Implications

**Couple and Family Outcomes**. Successful family entrepreneurship entails not only a viable entrepreneurial venture but one that considers the couple and family needs as well. Effectuation processes in creating a new venture vary for male and female entrepreneurs. That variation entails consideration of security needs of the family, both financial and relational as well as what is needed to form, finance, and maintain the new venture. Family resources for doing so flow from adaptive capacity.

Adaptive capacity of a couple creating a new business venture is grounded in the "couplehood" which possesses stocks of relationship capital. Those stocks include such resources as business expertise, financing for business formation, spousal commitment, expectations for the business and couple relationship, development of a copreneurial identity, goal congruence, social support, and the balancing of business and family demands. All these resources emanate from a healthy couple relationship. Access and use of those spousal resources are all mediated from quality, satisfying, and productive communication.

Satisfying and productive communication is steeped in the emotional foundation of resources

within a couplehood's adaptive capacity. Out of this emotional foundation evolves the behaviors that either enhance or constrain the effectuation of the new venture. Because of the importance of this emotion/behavior duality, it is critical to understand the consistency of the emotional foundation that is so vital in tapping the store of adaptive capacity to combat the liability of newness of venture creation and contribute to the venture's viability.

Clearly, other family relationships within the entrepreneurial family are worthy of study relative to emotion/behavior duality in the family and the business. To date, that duality has not been explored relative to parent-child relationships or sibling relationships. Such family relationships are vital to understanding the involvement of family members in the family as well as the business. Moreover, successful succession hinges on the involvement and socialization of children in the business via an early, continuous process over time that could be enhanced by exploring the inherent emotion/behavior duality therein.

**New Venture Outcomes**. The assessment of profit and viability of venture goal achievement is complex. That assessment does not lie entirely within the business realm; this entry's contents illustrated interconnection patterns between couple interaction scores and level of profit and viability goal achievement. More research in this arena using observational techniques and validated interactional coding schemes is called for in the future. This will allow deeper understanding of how unobservable emotions, expectations, and motivations manifest in observable interaction behaviors. Such observable interactional behaviors are the essence of resilience processes. In turn, these observable behaviors strengthen the adaptive capacity of entrepreneurial couples to address the liability of newness for their new entrepreneurial venture.

The results of the observational study presented interaction patterns that were associated with the assessment of business goal achievement. The interaction rating scales demonstrated variation in the interaction patterns among the couples with differential assessments of goal achievement levels. Those couples who had a strong or good positive to negative interaction ratios could negotiate differences that resulted in productive effectuation of the planned business change and high or satisfactory achievement of profit and viability goals. Those couples with low positive to negative interaction ratios struggled in both executing their planned business change and in achieving their profit and viability goals.

**Applications**. Understanding the emotion/behavior duality offers important and useful applications for researchers, educators, and practitioners, as well as for those whose expertise may be outside the family emotion/behavior duality explored herein. Researchers are challenged to explore more deeply how interaction behaviors represent underlining, unobservable emotions within the family and business.

To ignore an undeniable relationship between emotions and behaviors is to remain myopic about the nature and dynamics of entrepreneurial couples and families. This connection has often been overlooked although observational data can be garnered and analyzed for greater understanding of venture creation processes. We suggest using the SFBT or EVCT theories presented herein and in combination with the Family FIRO Theory to do so. High quality observational data is imperative to explore further the sources of resilience among other factors that lead to specific outcomes in new venture creation.

Educators and practitioners continually build bridges between research and practice. Therefore, understanding the emotion/behavior duality is imperative for these professionals. Without such knowledge, professional outcomes will be limited and less helpful to couples and families engaged in new venture creation. In practice, the emotion/behavior duality will, no doubt, be experienced first-hand and must be embraced and facilitated appropriately for the benefit of the family, the couple, and the business. The practice of educators and practitioners could be enhanced by the implementation of research-based assessment tools. Equally important, educators or practitioners may be positioned to relay important field observations to researchers for informing and improving future research. The harmonious and synchronous professional exchanges among

researchers, educators, and practitioners will lead to greater outcomes for all couples and other family members involved in family entrepreneurship. Optimally, theory informs practice and vice versa.

**Implications**. During times of change, which creates stress for both firm and family, couple interaction patterns established during times of stability are either enhanced or exacerbated. Moreover, the effectuation process of new venture creation is vitally linked to the level of effective interpersonal dynamics within couples and families. Patterns of resource allocation including social capital resources will have to be reconstructed along with those of human, financial and physical capital as an entrepreneurial endeavor is effectuated. Not doing so may drain the adaptive capacity of the entrepreneur(s) and the business enterprise to the point where the entrepreneurial endeavor fails or the enterprise itself is weakened. Thus, when contemplating or planning entrepreneurial endeavors, it is critical to evaluate social capital interaction within the owning family along with human, financial, and physical capital resources needed to effectuate the entrepreneurial endeavor. Doing so is critical in reconciling intentions, opportunities, and resources as part of the effectuation process in the formulation stage of a venture.

Understanding the emotion/behavior duality must be explored at the behavioral level and then linked to the overall process of reconciling demands versus change as well as the reconstruction within the interface subsystem of SFBT and within the iterative and ongoing effectuation process of the EVCT. To do otherwise is to adhere to a myopic view of the dynamics of the new venture creation with processes. The view needs to extend beyond the "who" and "what" of entrepreneurial decision-making to the "omitted critical connection" of the interactive decision-making processes reflected in the emotion/behavior duality – the bridge between the "who/what" and a successful family entrepreneurship outcome. Researchers, educators, and practitioners must meet the challenge of taking a deeper examination of these dynamics within the new venture creation processes.

## Family Members' Reactions to Their Formerly Incarcerated Loved One's Return Home

Shelia Lumar[1] and Linda D. Ladd[2]
[1]Department of Human Services Management and Leadership, University of North Texas at Dallas, Dallas, TX, USA
[2]Department of Human Development, Family Studies and Counseling, Texas Woman's University, Denton, TX, USA

### Synonyms

Ex-offender; Family members' experiences; Formerly incarcerated; Reentry; Stress

### Definition

Family member responses to the prison release of a previously incarcerated loved one.

## Introduction

Incarceration of parents and partners leaves behind a trail of vulnerable children and fragmented families, which invariably leads to family stress when the offender returns home after incarceration (Arditti 2016; Martinez and Christian 2009) and initiates another adaptation that requires multiple types of support from both the nuclear and extended family (Arditti 2016; Harris et al. 2010). Released formerly incarcerated members return to families who are hopeful for change, but all too soon, the family finds itself involved in hard-fought negotiations for changes in behaviors, relationships, and adjustments as family members learn to cope with the formerly incarcerated members' institutionalized negative behaviors and habits (Furstenberg 1995; LaVigne et al. 2007). The return of formerly incarcerated family members tends to be marked by a negative undertone because the nature of the separation from family members is due to criminal behavior (Clone and DeHart 2014; Day et al. 2005). Most research has focused on the experience of formerly incarcerated members after they returned home; few researchers have focused on the larger experience of adult family members when they are informed that the offender is being released and will return home.

When family members are incarcerated, the harsh separation leads to a deterioration of both family and intimate relationships; upon family reunification, the family faces new burdens as they attempt to reestablish close relationships (Shollenberger 2009; Western et al. 2015). Shapiro and Schwartz (2001) learned that family members replaced their initial hesitations about the released formerly incarcerated member with hard work directed at decreasing the likelihood that the family member would reoffend and provided opportunities for renewed family and friend relationships.

When their family member was in prison, family members were forced to cope, positively or negatively, maintain, and secure the functioning of their family (Shapiro and Schwartz 2001). Upon the formerly incarcerated family members' return, the adult family members renegotiated parental roles and family interactions, added the formerly incarcerated members' legal and personal expenses into the family budget, and learned to deal with addiction, substance abuse, and mental health problems (LaVigne et al. 2004).

## Double ABCX Model of Family Stress, Adaptation, and Adjustment

The Double ABCX Model of Stress, Adaptation, and Adjustment (McCubbin and Figley 1983) can be used to explain how a family adapts and adjusts systemically over time to one stressful event (factors a-b-c-x) which is then followed by a second, similar stressful event (aA-bB-cC-xX). After the initial stressful event (factor a), the family responds by processing and making a systemic and progressive evaluation of the personal resources (factor b) needed to deal with the event; and, finally, family members define that initial stressful event according to their own subjective interpretation of the event (factor c). According to the Double ABCX Model, a second event or crisis (factor x) ushers in the second half of the model which repeats the adaptation and adjustment process. Following the crisis event (factor x), the family members must again deal with a pileup of demands (factor aA) by adapting their personal resources (factor bB) and their perceptions or coherence of the event (factor cC) as they word to manage their stress. This culminates in the evaluation of the adjustment (factor xX). According to Lavee et al. (1985), all factors of the Double ABCX Model lead to either positive or negative family adaptation (factor xX) that is identified as either bonadaptation or maladaptation. Lavee and colleagues found that families contend with a pileup of stressors brought on by daily living activities and unexpected events that required adjustment in the way families function. It was also found that regardless of the stressor impacting the family, the members modified family roles, obtained new coping skills, and adapted to a new way of living that was necessary to bring the family system back to a state of equilibrium (Lavee et al. 1985).

## Purpose Statement

The primary author explored how the Double ABCX Model (McCubbin and Figley 1983) could explain the experience of release from incarceration and reentry as told by family members who provided support to the formerly incarcerated family members. In this exploration, adult family members described their resources and perceptions when coping and adapting to the notification that the incarcerated member was coming home and, then, the actual reentry of the formerly incarcerated family member back into the family.

## Research Questions

### Qualitative Questions

1. How did the notification of the incarcerated offender's upcoming release impact the family?
2. In each family, how did the experience of having the formerly incarcerated family member reenter the family cause stress, and how did the family cope with the reentry?
3. What types of resources did the family find useful in helping them cope with the formerly incarcerated member's reentry?
4. What did the family member think and feel once the formerly incarcerated family member actually reentered the family?

### Quantitative Research Question

5. What is the relationship between family reports of coping and resilience after the formerly incarcerated family member returned home and the four family groups (location where the formerly incarcerated member lived after reentry), length of time of family support (1–24 months), and length of time since reentry (1–24 months)?

## Hypotheses

1. There will be no significant statistical relationship when the scores of family members on *F-COPES* are compared by type of family group as defined by location, the length of time the family member provided support for the formerly incarcerated member, and the length of time since the reentry of the formerly incarcerated family member.
2. There will be no significant statistical relationship when the scores of family members on the *Family Hardiness Inventory* are compared by type of family group as defined by location, the length of time the family member provided support for the formerly incarcerated member, and the length of time since the reentry of the formerly incarcerated member.

## Quantitative Instruments

Two quantitative instruments were used that measured coping and resilience (factor xX). The Family Crisis Oriented Personal Evaluation Scale (F-COPES) (McCubbin et al. 1996a) is a 30-item instrument that identifies problem-solving and behavior strategies that family members utilize to cope during problem situations; the scale yields information on internal and external family coping patterns (McCubbin et al. 1996a). The 20-item Family Hardiness Index (FHI) defines and measures hardiness in terms of those stress-resistant and adaptive resources used by families to buffer the impact of stressors and demands as they facilitate adaptation over time (McCubbin et al. 1996b). Reliability and validity have been established for both instruments.

## Sample

Adult family members who had provided significant support for the formerly incarcerated offender were recruited via purposive and snowball sampling from community groups such as faith-based support groups and universities using telephone, mail, and e-mail. Study criteria required that family members had provided the adult formerly incarcerated member with at least five of nine types of supports (Shapiro and

Schwartz 2001) following reentry. The 16 female and 7 male participants (ages 21–60) had provided support for their formerly incarcerated family member for 6 months to 2 years after release. The sample ($n = 23$) included four family groups: spouses ($n = 6$), parents ($n = 7$), siblings ($n = 7$), and adult children ($n = 3$). In this sample, 17 participants were married and 6 were single. Race included African Americans ($n = 16$), Caucasians ($n = 4$), and Hispanic-Americans ($n = 3$). Income levels varied as 16 participants reported a household income below $100,000/year and the remaining 7 reported earning over $100,000 per year.

## Data Collection

In this exploratory mixed-method study, the primary author completed individual, face-to-face interviews (90 min) that captured both the qualitative and quantitative data concurrently (Creswell 2013). Data on the types of support (Shapiro and Schwartz 2001) that all family types provided following the reentry of the formerly incarcerated members: financial support (100%), access to spiritual/religious support (96%), transportation (91%), housing (78%), employment guidance (52%), childcare (52%), educational support (30%), and medical services and mental health support (30%) (Table 1).

## Coding

The primary author transcribed the 23 interviews and mailed them to 15 participants who had agreed to member check their individual interview. Only 12 transcripts were returned; 3 participants did not respond to further contact. The primary coder read and reread the transcribed interviews, and initial categories were identified based on the Double ABCX Model; the second coder was trained to follow that protocol and identified similar categories (Creswell 2013). The two coders met several times to achieve agreement on the patterns and categories. Acceptable coder agreement (80%) was achieved on patterns and categories after several meetings of the coders.

## Results

Participant qualitative interviews were examined through the lens of the pre-crisis factors (a, b, c, and x) and post-crisis factors (aA, bB, cC, and xX) as described in the Double ABCX Model of Stress (McCubbin and Figley 1983). Families reported being stressed when they were notified that the incarcerated family member was returning home (factor a). Their responses to this stressor fell into two categories: the existing resources (factor b) they identified for coping with the release and their perceptions (factor c) about the upcoming release. This pre-crisis factors conclude with the

**Family Members' Reactions to Their Formerly Incarcerated Loved One's Return Home, Table 1** Nine types of support provided by four family types

actual return (crisis event factor x) of the incarcerated family member. The results drawn from the post-crisis factors (aA, bB, and cC) about the actual return of the formerly incarcerated family members and the level of adaptation (factor xX) will be reported later in this section.

## Qualitative Pre-crisis Factors

### Notification that the Incarcerated Family Member Was Returning Home (Factor a)

Participants identified existing resources (factor b) that would help them manage the stressor of having their family member return from incarceration, as follows: personal resources, family resources, and resources from social, community, and government groups. Participants identified their perceptions (factor c) about the return of their family members: positive perceptions, negative perceptions, and participant perceptions of help from other family members. The crisis (factor x) occurred when the formerly incarcerated family members returned to the participants' homes. Due to the large data set gathered in this study, only findings generated by a minimum of 60% of each group will be reported, unless otherwise noted.

### Resource Categories (Factor b)

#### Personal Resources

Participants identified three types of personal resources: external resources, internal qualities, and maladaptive behavior patterns. They drew on four external resources to help them manage their stress: employment, homeownership, financial stability, and transportation. Participants relied on multiple internal qualities to help them deal with the stress: spirituality, altruism, compassion, forgiveness, patience, self-reliance, resilience, optimism, support, loyalty to the incarcerated member, knowledge about reentry challenges, and strong family togetherness. However, some members of each family type turned to gambling as a maladaptive behavior pattern and adopted an attitude of aloofness about the event; several family members noted that they withdrew from others and isolated themselves.

#### Family Resources

Family members identified resources that existed within their nuclear family: family communication, family emotional support, family spiritual support, family financial resources, family collaboration, and family resourcefulness.

#### Social, Community, and Government Resources

Family members reported that their social resources included friends and church members. Community resources included faith-based organizations, community support groups, and school and transition programs designed for returning formerly incarcerated members. Of the four family types, only spouses and parents were approved to receive government resources such as food stamps and Temporary Assistance to Needy Families (TANF).

### Perceptions About the Return of the Incarcerated Member (Factor c)

The family members' perceptions of the incarcerated members' return comprise the third factor in the Double ABCX pre-crisis model. The perceptions of the participants fell into three broad categories: (1) positive perceptions of the return, (2) negative perceptions of the return, and (3) participant perceptions of help from other family members. The following categories were reported by at least 60% of the study participants.

#### Positive Perceptions of the Return

Participants identified five positive perceptions of the incarcerated members' return: (1) the release would be a joyous occasion, (2) the release would not alter family roles and routines, (3) time was needed for adjustment, (4) incarceration would change the formerly incarcerated member, and (5) family members felt prepared to offer the incarcerated member a home.

#### Negative Perceptions of the Return

The participants reported three general areas of negativity about the return of the incarcerated family members: participants' mixed emotions, adjustment of the incarcerated family member, and community reactions. Participants' mixed emotions were generated by the following:

(1) incarceration had changed the family member, (2) the incarcerated member would have unmet needs and was untrustworthy, (3) prior family strains had not been resolved, and (4) participants felt obligated to support the incarcerated members after their return. Family members reported concern about the incarcerated members' ability to readjust due to the following: (1) return to criminal activity and/or drug use, (2) unemployment, (3) no change in their maladaptive behavior, and (4) eventual return to prison. Negative emotions about the community included a belief that the criminal justice system had not adequately prepared the incarcerated member for release back into the community and that participants felt social stigma from having an incarcerated family member.

#### Participant's Perceptions of Other Family Members

When asked about how other family members (immediate, extended, and fictive kin) would perceive the release and return of the incarcerated members, responses were mainly positive, including (1) children need both parents in the home for healthy child development; (2) after the return, the family members would be together again; (3) helping the incarcerated member was viewed as positive; and (4) family members would be willing to provide support to the incarcerated member for a specific period. Still, some participants shared negative perceptions that the incarcerated family member would not be able to change and that the family's current lifestyle would be altered.

### Reentry of the Formerly Incarcerated Family Member (Pre-crisis Factor x)

According to the Double ABCX Model (McCubbin and Figley 1983), the pre-crisis period ended for the family members when the newly released family member reentered the home (factor x) generating a crisis within that home. Following the Model, participants in this study reported how they dealt with their particular pileup of demands (factor aA) by adapting their resources (factor bB) and their perceptions of the formerly incarcerated family members' return (factor cC). The final piece of the Double ABCX Model measures how well the family member adapted to the return of the formerly incarcerated family member by whether the adaptation was good (bonadaptation) or bad (maladaptation) (Lavee et al. 1985). In this section, the data percentages will be reported, unless otherwise noted.

### Qualitative Post-crisis Factors

The actual return and reentry of the formerly incarcerated family member yielded three categories: personal pileups of demands (factor aA), personal resources and maladaptive behavior patterns (factor bB), and coherence (factor cC). Specific data percentages are reported for the three resource categories below.

### Personal Pileups of Demands (Factor aA)

The pileup of demands (factor aA) signifies the accumulation of stressors associated with the participant adjusting to the formerly incarcerated offender's reentry. Some of the major demands reported by the family members include increased relationship conflicts, severe financial hardships due to legal fees and the formerly incarcerated offenders not finding employment, and lack of formerly incarcerated family members' motivation to change behaviors. The results from this study indicated that the return of the formerly incarcerated family member produced a disruption in the participants' families to a degree that required ongoing adjustments in the way the families functioned.

### Resource Categories (Factor bB)

#### Personal Resources: Maladaptive Behavior Patterns

When reported personal resources were compared for the pre-crisis and post-crisis phase of the Model, no new areas of resources were identified. However, family members did report using existing resources in new ways that were either maladaptive or negative: (1) increased food consumption (73%), (2) increased cigarette smoking (67%), (3) increased substance use (67%), (4) overspending (71%), (5) gambling (50%), (6) isolation/withdrawal (46%), and (7) aloofness (62%).

### Family Resources

Family resources were available resources participants relied on after they were notified that the offender was going to be released. The family resources included (1) family communication (51%), (2) family emotional support (83%), (3) family spiritual support (66%), (4) family financial support (65%), (5) family collaboration (60%), and (6) family resourcefulness (59%).

### Social, Community, and Government Resources

Friends and church members continued to be identified by participants as social resources. Community resources were used by all family members except by adult children, as follows: faith-based organizations (70%), community support groups (56%), and school and transition programs (60%) designed for returning formerly incarcerated offenders. The government resources such as food stamps and Temporary Assistance to Needy Families (TANF) were available only to spouses and parents.

## Perception or Coherence (cC Factor)

### Positive Coherence

During the pre-crisis period, family members had predicted that their role(s) would change within the family when the formerly incarcerated offender returned home. Now in the post-crisis phase, nearly all family members (75%) identified the following behaviors as being important to the reunification of the family: (1) communication between family members, (2) commitment that helped the formerly incarcerated offender master reentry, and (3) the need for community resources was essential. Other family members (50%) understood that emotional and financial supports were critical for the success of the reentry of formerly incarcerated offenders. Finally, the need for maintaining spiritual faith was important for some family members (40%).

### Negative Coherence

Nearly all of the family members (80%), especially spouses, noted that support for the formerly incarcerated offender became difficult to maintain over time. Major examples include the following: (1) the family members grew more resentful as they provided support to the formerly incarcerated offender who returned home with many unmet needs, (2) the formerly incarcerated offender's parole requirements were very demanding, and (3) they felt ashamed and stigmatized for having a family member who had been incarcerated. Most of the family members (90%) predicted that their continued support of the formerly incarcerated offender would be limited or stopped if the formerly incarcerated offender used drugs or reoffended. Concern by family members (60%) for their emotional security and being disrespected by the formerly incarcerated offender was noted. Finally, participants (80%) stated that there was a lack of quality community resources to help the formerly incarcerated offender get on his feet and contribute to the family.

### Ambiguous Coherence

Almost all participants (80%) had mixed emotions about their acceptance of the formerly incarcerated offender upon his/her return as initial happiness became mixed with the challenge of rebuilding the family and negotiating roles. While participants (60%) stated that they were glad the formerly incarcerated offender was out of prison, they also felt that (1) it was difficult to have that family member back in the family, (2) the formerly incarcerated offender was so different that he did not appear to be the same person, (3) family support for the formerly incarcerated offender had limitations so that the family members did not become dependent, and (4) several mentioned resenting the formerly incarcerated offender for going to prison in the first place.

## Family Adaptation: Bonadaptation and Maladaptation (xX Factor)

Family adaptation (xX factor) is the product of the family members negotiating both the pre-crisis and post-crisis phases of the Double ABCX Model; it is a measure of the family's attempt to reduce the stress created by the crisis through adapting existing resources and managing perception or coherence of the event (McCubbin and Figley 1983). No relationship was found between the location (four family groups), length of time of

support, and time since reentry, so both hypotheses were accepted.

## Discussion

Researchers have learned that family ties with their formerly incarcerated family member significantly influences that person's post-release success or failure (Brunton-Smith and McCarthy 2017), but limited research has explored reentry from the family perspective (Martinez and Christian 2009).

Using the Double ABCX Model of Stress, Adaptation, and Adjustment (McCubbin and Figley 1983), 23 family members were interviewed to learn about the resources and perceptions they employed when notified that their incarcerated family members were returning home and how they adapted and adjusted those resources and perceptions after the return of the incarcerated family members. At the end of their qualitative interviews, family members provided self-report data concerning their coping strategies (F-COPES) and problem-resolving strategies (Family Hardiness Index) which allowed us to measure their adaptation to the reentry of the formerly incarcerated offender.

### Assessing Family Member Resources Before and After the Offender Returns

Challenges imposed upon the family members as the formerly incarcerated offenders returned to the family did not deter family members from expressing a sense of willingness, commitment, and obligation toward helping their family members. Still, the results of this indicate that formerly incarcerated offenders' reentry into the family after release from incarceration impacted the family members' social, emotional, physical, and financial resources. The relationships that the formerly incarcerated offenders had with the family members who provided the majority of their support impacted the type of support as well as the depth and length of time the support was provided. For most of the study participants, although committed to rebuilding the relationship with the formerly incarcerated offender after release, providing support took a toll on their well-being because the type of support and the length of time the support was needed to assist the formerly incarcerated offender with transitioning into the family was draining on their resources that eventually increased their level of stress and decreased their sense of being successful. Like this study, other researchers found that even though the family members may be willing to support the formerly incarcerated offender, their providing support can be difficult and can weigh heavily on the family member over time, despite their best intentions toward the ex-offender (Naser and LaVigne 2006; Naser and Visher 2006; Travis et al. 2005).

### Change in Family Member Perceptions and Coherence After the Offender Returns

The initial homecoming of the formerly incarcerated offenders was commonly perceived as ambiguous for most participants who moved from feeling positive about the anticipated reunion to feeling more negative over time. For most family members, their first reports of happiness evolved into a feeling of uncertainty as the formerly incarcerated offender rarely made the necessary positive behavioral changes to keep them from reoffending; similar findings were reported by Martinez and Christian (2009). As found by other studies, the act of supporting the formerly incarcerated offenders after release became a primary source of strain and stress for the family members during the reentry process (Western et al. 2015).

### Usefulness of the Double ABCX Model of Stress, Adaptation, and Adjustment

Using the Double ABCX Model (McCubbin and Figley 1983) provided us with the systemic and linear lens to explore the experiences of families of returning formerly incarcerated offenders in terms of length of time since the return of the formerly incarcerated offender and length of time the family provided support for that family member. By using this theoretical model, we could examine how families reported their stress

both before and after the offender's return and build an evidence-based understanding of coping mechanisms families rely on to promote adaptation over time. Using the Double ABCX provides us with insight as to how and why some families are successful and others are not successful with managing stress manifested in the system. The Double ABCX model is parsimonious and provides a pragmatic view of how families respond to, interact with, and overcome or succumb to stressful situations.

## Limitations

### Double ABCX Model of Stress, Adaptation, and Adjustment

Like McCubbin and Figley (1983), this researcher found that the participants in this study reported their experiences of stress in a circular fashion such that family members were unable to distinguish the stressor event from their reaction to the stressor. The source of stress is not inherent in the stressor by itself, but rather is part of the larger family response to the stressor event.

### Qualitative Sample

Using a small qualitative sample allowed for in-depth exploration of the lived experiences of the family members, but the findings cannot be generalized to larger audiences. Interviewing only one family member may have affected the perspective of how the return of the formerly incarcerated family member impacted the family.

## Implications

### Criminal Justice

Reentry preparation by the criminal justice system needs to include setting realistic goals for offenders upon reintegration into the family (Travis 2001), educating the family on their need to set realistic expectations of the formerly incarcerated offender and themselves, and educating the family on institutionalized offender behaviors after reentry (Clone and DeHart 2014).

### Policymakers

Policymakers need to reconsider the question of how their policies reflect the distinctive demands of the reentry process on the formerly incarcerated and how those policies set up rigid conditions that neither the formerly incarcerated person nor the family members who support them can accomplish (Petersilia 2001).

### Community Social Service Providers

Community social service providers are encouraged to help family members from all four groups consider how their unique family will absorb the changes to their family system when the formerly incarcerated person reenters the family. Strengthening the family needs to happen well before the incarcerated person returns home; the following areas need to be addressed: housing, healthcare, financial management and planning, employment, and vocational training.

### Researchers in the Family and Criminal Justice Fields

Collaboration by researchers in both family and criminal justice fields is essential to develop policy, design programs, and document services that are needed to meet the comprehensive and systemic needs of these families.

## Recommendations for Future Research

Collecting data about the family resources and perceptions of the family members about the future return of their incarcerated family members along with data concerning the actual return of the offender has provided us with a new understanding of this experience for families (Petersilia 2004). The limitation of our qualitative study suggests that using a mixed-method approach with a larger sample would greatly expand our understanding of this experience.

Using this model as the framework, other variables need to be explored such as the effect of the return on the children, how different cultures manage resources and perception of the formerly incarcerated offenders' return, and gender

differences in the offender and the supportive family member.

## Conclusion

By using the Double ABCX Model of Family Stress, Adaptation, and Adjustment (McCubbin and Figley 1983) as our theoretical framework, we discovered that family members display a deep commitment to the formerly incarcerated family members across nine areas of support despite low or often no support from the community and government resources. Most families were unprepared for the needs and demands made on the family system by the return of the formerly incarcerated family members, and these changes often overwhelmed the family members and the family system. Finally, the need for significantly increased support from extended family members, the community, and government agencies is crucial for the successful reintegration of the formerly incarcerated member into their family and community.

# Fatality Management in Crises

Scott C. Warnasch[1] and Emily Carroll[2]
[1]LLC Consulting, Bloomfield, NJ, USA
[2]MSPH, New York, NY, USA

## Synonyms

Disaster victim identification; Mass disaster response; Mass fatality management

## Definition

*Fatality Management* is the branch of a mass fatality incident response accountable for the recovery, examination, and identification of the victims, as well as attending to the immediate needs of the victims' families.

A *Mass Fatality Incident* (MFI) is any natural or manmade incident of scale or complexity, which requires special operations to recover, examine, and identify the victims.

*Chain of Custody* is the legal process of the chronological documentation of the handling, transferal, and examination of remains, evidence, and personal effects from the time of initial recovery to final disposition.

## Introduction

Mass fatality management (MFM) is a fundamental component of a mass disaster/fatality response. Though less publicly discussed prior to a disaster than other aspects of the operation, the accurate and efficient execution of fatality management will have a lasting impact on the effected communities. The success of a fatality management operation is determined by the manner in which the authorities serve the living by efficiently recovering and identifying decedents and returning their remains to their loved ones. An equally important responsibility of MFM is the dissemination of timely and accurate information to the affected families, provided in the most transparent manner possible (Jensen 1999). These tasks are technically and emotionally complex undertakings that require scientific and ethical rigor, complemented with sensitivity and compassion.

## The Basic Components and Objectives of Mass Fatality Management

Mass fatality management is comprised of a diverse set of operations that encompass a wide array of objectives ranging from the large-scale aspects of disaster response to the most intimate details of victim identification (RCPT 2012; INTERPOL 2014). MFM operational tasks are conducted by medicolegal and forensic science experts and bolstered by a variety of support teams. Regardless of the type of mass fatality incident or its location, the fundamental components of fatality management are comprised of four basic components: scene/recovery, morgue/examination, family assistance/antemortem data collection, and reconciliation/identification (Dudley 2013). The terminology of these components may vary from country to country or jurisdiction, and depending on how the jurisdictional authority is structured, these basic components may be further broken down into more specific operational modules; however, the four basic components will remain constant.

The operational tasks of any particular MFI are likely to emphasize different priorities, tactical operations, or incident-specific needs, depending on the circumstances. However, mass fatality management is directly shaped by mission objectives and guided by a standardized set of best practices (RCPT 2012; Dudley 2013; INTERPOL 2014).

## Legal Jurisdictional Authority of a Mass Fatality Incident

Mass fatality management requires a determination as to what agency or authority (local, state, regional, or federal) has jurisdiction over the decedents in a given location. The lead agency may be the local medical examiner, coroner, or equivalent; however, if the incident is geographically large, complex, or criminal in nature, it may be necessary for local authorities to relinquish responsibilities temporarily to their state or federal counterparts or to establish co-responsibilities with another jurisdictions within the region to manage aspects of the operation (RCPT 2012; Gershon et al. 2014; INTERPOL 2014).

Mass fatality incidents are typically complicated operations that require a considerable amount of coordination and communication within the jurisdictional authority's operation, as well as between it and the other branches of the disaster response. The coordination of all participating parties is paramount in ensuring that one operational priority or objective does not impede the proper execution of another (Jensen 1999). The jurisdictional authority coordinates and manages the mass fatality response operation from a central command center where all executive-level decisions are made and disseminated, as well as coordination with the other participation agencies, support entities, and the media. All components of the response operation are assisted by support teams, such as logistics, information technology, communications, transportation, health and safety, and procurement (RCPT 2012; INTERPOL 2014). In addition, a variety of ancillary incident-specific considerations, such as HAZMAT mitigation and security, may be included in the responsibilities of the mass fatality branch of a disaster response or combined with the overall incident operation. In some instances, the military or National Guard may be deployed to assist with these tasks. For a breakdown of the Incident Command and Control Systems, see INTERPOL (2014), FEMA, and RCPT (2012).

## Multiagency and International Incident Response and Investigation

Due to the ease of travel and interconnected nature of the modern world, mass fatality incidents frequently include citizens from several countries. The authorities of the country where the disaster has occurred have primary jurisdiction and responsibility for the recovery and identification of the victims. However, some level of responsibility of the fatality management operation may fall upon the nation of the foreign victims, as well as the international community, which may provide teams of specialists to assist in the operation (WHO et al. 2007; McEntire et al. 2012). This international partnership requires the participating countries to agree on common standards and practices, jurisdictional authority, and command and control arrangements, as well as communication and information management (Morgan et al. 2006; INTERPOL 2014).

If the MFI is determined to be man-made (criminal in intent or not), criminal and/or civil litigation investigations will result, and additional agencies, and possible jurisdictional authority considerations, may be necessary (INTERPOL 2014). Medicolegal systems vary from country to country, and fatality management operations may be handled as a law enforcement responsibility (e.g., by INTERPOL) or by forensic science response entities, such as the private company Kenyon International Emergency Services (Kenyon) or the US Department of Health and Human Services Disaster Mortuary Operation Response Team (DMORT 2015). INTERPOL is primarily an international police organization available to assist national police with security arrangements; it is available to respond in 190 member countries. However, in addition to

law enforcement, it can assume a crisis-management role during serious incidents and coordinate assistance through specialized incident response teams comprised of experts from various disciplines. Interpol's Command and Coordination Centre is in Lyon, France, with additional offices in Buenos Aires, Argentina, and Singapore (INTERPOL CCC). However, incidents occurring outside the USA but involving US citizens may be investigated by the Federal Bureau of Investigations Disaster Squad and supported by DMORT (FBI 2010). The investigation of incidents involving transportation systems in the USA is conducted by the National Transportation Safety Board (NTSB; DMORT 2006; Vidoli and Mundorff 2012).

## Regional Response Planning and Strategies

Although a particular local entity or agency may have jurisdictional authority over a MFI, most local jurisdictions lack the resources and expertise needed to conduct an independent MFM operation. Although the jurisdictional authority has agreements for support and advisement with county, state, and federal agencies, deploying those resources to the affected area can take time. To mitigate potential short-term insufficiencies, many local jurisdictions have developed regional response plans to pool resources and expertise and conduct regional preparedness exercises (RCPT 2012; Houston 2009).

## Quality Control, Remains Tracking, and Data Management

All aspects of MFM are reliant on accurate and detailed information upon which identifications are based. Robust quality control and data management systems are vital to the collection, collation, and matching of relevant identification data. The identification process relies on the maintenance of accurate and detailed information, beginning at the time and place of recovery and continuing throughout the entire identification process. A system for storing and tracking remains, pre- and post-examination, is necessary to ensure that all the remains have been accounted for, processed, and documented. To maintain chain-of-custody protocols, recovered victims' remains and associated personal effects are tagged using a unique numbering system as early in the process as possible. Protocols are enacted to ensure that all documentation created during the several phases of the operation are backed up and subject to strict access control.

## Postmortem Data Collection

Postmortem data collection entails the collection of detailed information pertaining to a particular decedent through investigations conducted during discovery and recovery of the remains and morgue examination. Postmortem data is a crucial component in the identification of victims, as well as determination of manner and cause of death. Postmortem information is matched with antemortem data collected from the victim's family and other close associates, which forms the basis for making an identification.

## Preliminary Scene Assessment

Rescue operations, criminal investigation, and scene hazard mitigation take precedence over remains recovery. However, situational awareness of how these operations could damage or obscure victims' remains is critical to an effective recovery response. This information is gathered firsthand by assessment teams that are deployed as early as possible to characterize the nature and scope of the incident. The assessment team is a critical resource to provide information, communicate with other agencies, and establish the medicolegal authority's presence on scene. Once on scene, the assessment team liaises with other response agencies to understand the scope and scale of the incident, identify hazards, and determine the potential number of fatalities and the condition of the remains. This information is collectively

known as the incident characterization. This information is utilized by decision makers to determine the scale and timing of the deployment of fatality management resources to support the investigation, processing, and recovery of remains and is updated as new information becomes available (INTERPOL 2005; Houston 2009; RCPGP Scene 2015).

## Scene Recovery

The primary objectives of the recovery operation are to locate, expose, document, and extract victims' remains in a manner that produces the least amount of damage, alteration, or comingling (Adams and Byrd 2008; Dirkmaat 2012). Often conducted in teams, the documentation of the decedent includes photographing and describing the condition, position, and context of the remains, mapping their location, and assigning a tracking number. Some of these activities may overlap with the larger scene investigation and may be conducted as a joint exercise with other investigative agencies. Prior to removal from the scene, each remain receives a tracking number. This tracking number supports chain-of-custody protocols that will provide quality control and ensure the location of the remains is known throughout the process, as is who is responsible for them at any given time. The tracking system may consist of tags with handwritten tracking information on paper or preprinted, bar-coded tags. In regions that lack sufficient forensic and mortuary personnel, remains recovery may be conducted by members of law enforcement, first responders, the military, and volunteers (McEntire et al. 2012). Incidents that require heavy equipment for debris removal and other tasks will necessitate the involvement of outside contractors who work directly with the forensic recovery teams.

In cases involving confirmed or potential criminal acts, the recovery and processing of human remains may extend beyond victim identification and become a critical part of a complex criminal or accident investigation (INTERPOL 2014; Vidoli and Mundorff 2012). In these situations, the scene may be placed under the jurisdiction of an investigative agency and include oversight and direction from specialists, such as post-blast, ballistic, and HAZMAT experts. The potential presence of chemical, biological, radiological, nuclear, and explosive (CBRNE) contaminants will likely add additional levels of complexity to the operation and can affect the response time, availability of resources, personal protective requirements, and subject matter experts necessary to conduct the recovery and morgue processes; this may delay the release of remains to the families.

In instances that involve significant amounts of debris and/or a high degree of remains fragmentation, recovery operations conducted using archaeological methodology and led by forensic archaeologists and anthropologists have been demonstrated to be the most thorough and effective (Mundorff 2008; Dirkmaat 2012; Warnasch 2016).

## Body Collection Points and Tracking Systems

Body collection points (BCPs) provide temporary storage for remains prior to transportation to the morgue. BCPs provide security and protection of the remains and are critical for maintaining the integrity of the tracking and chain-of-custody system. BCPs also provide a temperature-controlled environment, which can delay decomposition and extend the period in which visual identifications can be conducted.

The strategy for the storage management of recovered remains depends on several factors, including the number and condition of the victims, location of incident, climate, degree of functional infrastructure, and cultural and religious considerations of the affected population(s) (Morgan et al. 2006). In a large MFI, the number of dead will typically exceed the available storage facility; therefore, augmentation of storage resources may be necessary. Storage options include refrigerated trailers, hospital morgues, funeral parlors, or temporary burial.

## Morgue Operations

A disaster morgue is a systematic approach for collecting postmortem data on the recovered remains and where evidence and personal effects associated with the body are collected and cataloged. The morgue process consists of several sequential operations; however, depending on the scale, type of incident, and hazards, the disaster morgue's arrangement and workflow may vary. The primary forensic tasks conducted during examination are triage, evidence collection, finger/palm/foot print, anthropology, DNA, odontology, pathology, radiology, and toxicology (NIJ 2006). Photographs of each remain are taken throughout the morgue process as necessary. Operational support components include quality assurance, security, health and safety, communication, and information technology. All aspects of morgue operations are conducted in accordance with established forensic standards or best practices (RCPT 2012).

Morgues use case management systems to track and maintain control of the remains, evidence, and documentation throughout the examination, storage, and release processes. Strict access policies are enforced to ensure the integrity of the investigation, maintain the dignity of the deceased, and prevent the contamination of evidence (NIJ 2006).

Disaster morgues are established away from the scene and restrict family access. Morgues can be set up in buildings or mobile facilities, as long as they provide adequate space, sanitation facilities, and security. In the instance of an MFI affecting a large geographical area, such as the 26 December 2004 Asian tsunami, it may be necessary to establish several morgues, and BCPs, throughout the region; depending on the jurisdiction, various agencies and organizations may have a role in the disaster morgue operation (WHO et al. 2007; RCPGP Morgue 2015).

## Antemortem Data Collection

Antemortem data collection is the other half of the identification process and is conducted in a separate location apart from the morgue. Antemortem data are the descriptive and comparative attributes of a potential victim collected through family member interviews, DNA samples collected from the missing person's personal effects, and their photograph, dental records, and radiographs.

## Missing Person Call Center

The missing person call center is a centralized mechanism for individuals to report their loved ones missing or unaccounted for following an incident. The callers will provide contact information and basic descriptive information about the missing person, such as their residence, place of employment, and last known location. This information is compiled into a preliminary missing person list. A missing person report prompts a preliminary investigation to determine if that person was actually involved in the incident and, if so, will determine if the person is unharmed and alive, injured and in the hospital, or potentially deceased. The reported missing list will ultimately be vetted through these preliminary investigations, and duplicate, fraudulent, and non-incident associated names will be removed. In addition, the call center may provide contact information regarding support groups and other immediate assistance. Past incidents and call center activations have shown that for every decedent involved in an incident, there will be approximately 100 calls. This requires the call center to be scalable to handle large call volumes (RCPGP FAC 2015). For an overview of the activation and operations of a call center, please see the 7 July Review Committee Report summarizing the use of the Metropolitan Police Service Casualty Bureau Call Center following the 7 July 2005 London Bombings (Greater London Authority 2006).

## Family Assistance Center (FAC)

Family Assistance Centers (FACs) provide several functions critical to the victim identification process, as well as support to the decedent's

families (Blakeney 2002; NTSB; RCPGP FAC 2015). The FAC provides a central location for the timely dissemination of information by the jurisdictional authority to the families regarding the relevant aspects of the operations prior to release to the media. The FAC also provides a private space where antemortem interviews with family members are conducted and DNA reference samples are collected. This space is referred to in the USA as the Victim Information Center (VIC) but may have other names elsewhere. The VIC is typically set up inside a restricted area of the FAC or in a separate facility. The antemortem interviews are typically conducted jointly by law enforcement and medicolegal investigators, with the support of mental health professionals, translators, and/or chaplaincy services as requested by the family. The antemortem interview, which can last several hours, collects descriptive information about the missing person, including, but not limited to, name, aliases, race, sex, eye color, known piercings, tattoos and/or implants, or other unique physical characteristics. In addition, the family may describe jewelry, clothing, or personal items carried by the missing person. During the interview, additional materials may be requested to support the investigation and identification process, including medical records, dental records, photographs, and DNA samples (NTSB).

In addition to descriptive information collected through family interviews, other antemortem data collected includes DNA reference samples acquired from the victims' personal items, such as hairbrush or razor, as well as buccal DNA swabs from family members for kinship comparison analysis. Other medical information, such as dental records, radiographs, and fingerprints, are also collected during the identification process (INTERPOL 2014; Gill et al. 2011).

The FAC model is situational, scalable, and need based. The decision to establish an FAC depends on several factors, including the number of fatalities, the impact to the local community and larger population, the number of victims' families that do not reside in the disaster area, and the complexity of recovery and identification operations. FACs are typically established near the incident scene, but not within sight or walking distance, or at another location convenient to the impacted community. In some transportation-related incidents, FACs may be set up at the departure location, the destination location, and the incident location. As a result, potentially three jurisdictions will coordinate and work with the transportation carrier to support the families and conduct investigations.

To best serve and assist the families, FACs must consider the number and type of religions and cultural groups involved in the incident. In addition, the facilities provide professional mental health counseling to families and staff (INTERPOL 2014; Houston 2009). Support providers may be federal agency victim specialists, transportation carrier assistance teams, or local community social service providers.

## Disaster Victim Identification/ Reconciliation Center

The Disaster Victim Identification (DVI) operation consists of matching the antemortem data collected at the Victim Identification Center and the postmortem data collected at the morgue. The reconciliation process typically begins with teams of forensic specialists performing analysis to reconcile the two sets of data to produce a preliminary or presumptive identification, which is presented to an identification review group. Ultimately, it is the lead authority that makes the final determination of identification and is responsible for issuing a death certificate. In certain circumstances, when the proper evidence is at hand, a death certificate may be issued in the absence of a victim's remains. The analysis/comparison is conducted using scientific methods, or modes, comparing the antemortem and postmortem data. For incidents involving a large number of fatalities, or fragmented remains, this process can be very time-consuming and complex, and a combination of modalities may be necessary to confirm a positive identification (DMORT 2006; WHO et al. 2007; INTERPOL 2014).

A significant factor determining the complexity and length of an identification operation is if the incident involved a closed or open population

of victims. A closed population typically relates to ticketed transportation incidents that do not involve anyone besides the passengers and the crew, and therefore the identity of all victims is known, such as airline incidents. However, the identification process of an open population consists of identifying an unknown number of victims, such as in case of the World Trade Center attacks or the 2004 Asian tsunami, which, regardless of the number of victims, is an innately more complex process (WHO et al. 2007; Gill et al. 2011; INTERPOL 2014).

## Remains Release

The final stage of a mass fatality management operation is the release of the remains to the legal next of kin. Determining a victims' legal next of kin can be complicated and emotional. The handling and return of victims' remains and property to families is an exceptionally sensitive aspect of mass fatality management, and how this process is conducted will have a significant influence on how the entire operation is judged (INTERPOL 2014). Typically, once a victim has been identified, the next of kin are notified by the jurisdictional authority or specific agency, and arrangements are made to collect and transport the remains to their final disposition.

Cultural and religious considerations of the victim and their family are also important factors in the handling and timing of the release of the remains. In international incidents, release and transportation of foreign nationals' remains are typically managed by the consulate of the victim's nation of origin.

In incidents that result in high body fragmentation and prolonged complex recovery situations, additional considerations may need to be addressed, such as whether all fragments will be identified, versus just a representative of each victim, and if the latter, what will be the final disposition of the unidentified remains (Vidoli and Mundorff 2012). After the initial identification has been made, the jurisdictional authority may consider a notification system/agreement that provides family members with options regarding when and how families are notified of additionally identified remains or if they wish to continue with the notification process at all (RCPGP FAC 2015).

## Long-Term Family Management

Long-term family management is maintained until the incident's conclusion and all remains and missing persons have been identified. The continuation of services after the FAC operation has ended is the responsibility of the jurisdictional authority, local government, or investigative agency. In the event of protracted recovery and identification operations, the jurisdictional authorities must be prepared to participate in government-sanctioned efforts to support decedent families over an extended period. This support may include providing official documentation pertaining to decedent identification to produce death certificates in the absence of recovered physical remains, managing families' expectations during an extended recovery and identification process, and liaising between the family and government agencies to obtain financial support for final disposition. This may include participating in the development of a memorial strategy (RCPT 2012).

## Conclusion

The effect of a mass fatality incident takes a heavy toll on the survivors and victims' families; however, if the mass fatality management plan is conducted properly, the added anxiety, and legal and financial complications, may be significantly reduced. Conversely, a poorly conducted or incomplete recovery operation can create additional heartache and prevent emotional closure for the affected families, as well as cause mistrust and resentment among the general population.

As the frequency and magnitude of natural and manmade disasters continues to increase, the role of mass fatality management within a disaster response arena has also grown in significance. Improvements in scientific technologies and

forensic methodology, in addition to the lessons learned from past mass disaster response operations, have significantly increased the efficiency and effectiveness of the response, increasing the likelihood that all or most victims will be identified. A consensus regarding the fundamental goals and methods of mass fatality management has been established by the international community, and such responses are becoming standardized in the developed world. However, factors such as geography and resource distribution, and political and cultural differences, on local and national levels, remain significant challenges to a fully global implementation system.

# Features of Italian Public Administration

Andrea Tomo
Department of Economics, Management, Institutions, University of Naples "Federico II", Naples, Italy

## Synonyms

Bureaucracy; Organization; Rules and regulations; Standardization

## Definition

Features of Italian public administration refer to high degrees of specialization (both horizontal and vertical), showing that the tasks performed by the participants may be collocated perfectly within the bureaucratic domain. According to the literature, these kinds of tasks are usually associated with a low motivation degree due to the high specialization and repetition of the activities carried out by employees. Instead, here the results from the analysis show a high degree of motivation associated with high degrees of horizontal and vertical specialization.

F

## Introduction

This short entry comments on the most recurring models per type of public administration and the overall model recurring in the Italian public administration. The discussion draws upon the results emerging from questionnaires administered to 156 Italian public servants. While the findings of these analyses are reported by Tomo (in press), in this essay the focus is set on the discussion of the models.

On these grounds, this entry offers insights into the complex and often unclear context of the public sector management, providing an in-depth analysis of the organizational features and of the activities carried out by public servants in the modern public administration. The paper is grounded in the awareness that public sector has too often shown inefficiencies despite the bloody costing measures undertaken and from manifold perspectives such as the economic (Rothstein and Downer 2012), social (Knott and Miller 2006), organizational (Meyer et al. 2014), and institutional ones (Magone 2011).

First, the discussion will focus on the features characterizing the specific types of public administration. Then, in the second section, an overall consideration will be done on the features characterizing the Italian Public Administration.

## Features per Type of Public Administration

*Central government*: By examining the characteristics emerging from the analysis, the resulting

model reflects perfectly the NPM features. Indeed, the findings support a great focus on performance as the priority, monetary incentives, a high formalization degree, and developed role for employees, in line with the principles introduced by the NPM approach.

*Local government*: In contrast to the first model, here it is possible to find the features of the classical bureaucracy. In this case, the priority is set on the attention to rules. Additionally, the features characterizing the Italian local government are high horizontal and vertical specialization degree. Along with this, a low degree of motivation emerges between the local government employees, thus confirming the general statement that the bureaucratic model is associated to a low motivation degree. This result might be commented on considering that local governments are characterized by highly standardized and repetitive tasks oriented toward providing basic services to the citizenship. Standardization, on the one hand, facilitates the response to massive request of similar services. Instead, on the other hand, since local governments are much more close to the citizenship than other public administrations, standardization may represent an hurdle to the request of differentiated and personalized services. This represents a critical issue to be debated, especially taking into account the increasing degree of complexity that characterizes the modern society, often connected to the need to find customized solutions for citizens/customers/stakeholders.

*Health and social care institutions*: here, the prevailing orientation is toward customer satisfaction and career development as the main incentive to improve employees' motivation. This confirms the adoption of the professional bureaucracy model.

*Education and research institutes*: these public administrations interestingly show some features that might be labeled in a model to be defined as anarchy, despite their employees report high degrees of motivation. These results could be commented in association with the fact that Italian institutions in these fields suffer from the assignment of low budgets to their activities; thus, employees working in these institutions require high degrees of intrinsic motivation to carry out their activities and develop a flexible way of working and reasoning that might help them to overcome the highly formal and staid bureaucratic procedures, thus resulting in a sort of anarchy.

*Social insurance institutions:* this type of public administration proved to be the most informal, as findings support the adoption of a participative managerial style, a high motivation degree, and a motivation incentive represented by the presence of informal leadership. This result is, at least, surprising, since it is expected that this kind of public administration is strongly characterized by bureaucratic features.

## An Analysis of the Italian Public Administration

Aiming at understanding also what may be the features characterizing overall the Italian public administration, Mintzberg's (1979) specialization matrix was applied to determine whether Weber's (1922) statement about the high specialization degree associated with the bureaucratic model occurs in the specific case analyzed. On this basis tasks' characteristics, as they emerged from the participants' answers about their tasks' specialization degrees, were analyzed. The results from the analysis show high degrees of specialization (both horizontal and vertical), thus confirming that the tasks performed by the participants may be collocated perfectly within the bureaucratic domain.

According to the literature, these kinds of tasks are usually associated with a low motivation degree due to the high specialization and repetition of the activities carried out by employees. Instead, here it has been considered what stated by Merton (1940) on the fact that bureaucrats took pride in their craft, which leads them to resist changes in established routines. The results from the analysis are perfectly in line with this claim, showing a high degree of motivation associated with high degrees of horizontal and vertical

specialization. On this ground, it could be argued that Italian public employees are "happy bureaucrats": they are strongly motivated by performing highly standardized tasks with low responsibilities, by the presence of monetary incentives and by having career development possibilities.

Along with these results, another interesting discussion emerges considering the conflict degree: by cumulating the percentages associated with the higher degrees, an overall percentage of 87% emerged, indicating a very high degree of conflict occurring within the observed public administrations. These data, associated with the desire expressed by 88% of the participants for a different managerial/leadership style that is much more oriented toward a participative one, produce an issue related to the low degree of involvement of employees in the processes and a negative organizational climate. This is also confirmed by the answers given by the participants about conflict resolution, in which 50% indicated the need for shared targets and 19% reported the need to create a positive organizational climate.

Again, the fact that, in reporting which kind of style/organizational model is adopted within their administrations, 33% of the participants indicated "anarchy" shows that Italian public administrations are often characterized by the absence of a well-structured organizational model, with no clear attribution of roles and responsibilities, as highlighted by 27% of the participants when asked which kind of interventions they imagined in the formalization degree.

The findings from this analysis support the conclusion that two faces of the Italian public administration exist: on one hand, employees are "happy bureaucrats," strongly motivated, despite repetitive and standardized tasks, by monetary incentives and strongly convinced to maintain the *status quo*, as assumed by Merton (1940) and as revealed by the high percentages of participants not reporting/proposing solutions to solve problems related to the specialization and formalization degrees. This result might be commented on by the fact that the introduction of the NPM principles has probably only led to employees' target displacement from the rules to the achievement of personal targets related to monetary incentives.

On the other hand, there are employees working in contexts in which anarchy is the most recurring organizational model, with no clear attribution of roles and responsibilities and no employee involvement.

Considering the results produced by this analysis, it seems that in Italy the reform led by the NPM principles during the 1990s has never been completed. The NPM principles have only been applied partially to some aspects of the public service provision process, while it appears that managers and employees are still rooted in the ancient bureaucratic way of thinking, operating, and behaving. Indeed, they reported to be "happy," despite being entrapped in standardized and repetitive tasks: results support the conclusion that the NPM introduction of monetary incentives, related to the achievement of specific targets, is a sufficient reward and motivating factor for Italian public servants.

On this basis, the results from this analysis show that a decoupling is taking place between theory and practice. In fact, while most of the literature suggests that employees carrying out repetitive tasks suffer from turnover, alienation, and low motivation, in practice, at least in the case analyzed, we are closer to what stated by Merton (1940) on the fact that bureaucrats took pride in their craft and resist to the changes in their established routines. In the Italian case, employees show a high degree of motivation, as it seems that they are defending the *status quo* that allows "having more by doing less."

Surely, an action that the Italian Government should consider taking is related to a tentative to reduce the excessive regulations, which often create overlapping laws and confusing situations, for which public employees themselves have no instruments to find solutions.

Then, the fact that many of the participants spontaneously indicated "anarchy" as the "organizational model" operating in their administration shows that the Italian Government needs to rethink the way in which public administrations are organized and managed, especially in

consideration of the fact that 27% of the participants highlighted no clear attribution of roles and responsibilities within their administrations.

The results obtained from the questionnaires confirm that the core problem to be faced within public administrations is related to the lack of an organizational culture oriented toward managing the public in the public interest and not in the interest of managers and employees trying to attain personal performance rewards. Thus, a suggestion for future research is to provide more in-depth analyses of the individual and behavioral dimensions to assure that managers' and employees' behaviors are in line with the development of a different culture that should then improve the way in which public administrations are managed and organized to pursue the public interest. Additionally, future research might provide a more in-depth analysis on the reasons behind the rise of the "anarchic" model in the Italian context.

Manifold interesting implications emerge from the present study. First, it contributes to the literature on public management by providing an advance in the discussion on bureaucratic and post-bureaucratic models. Second, it suggests that there is a need to pay much more attention to the individual and behavioral analysis, both in studying and in managing public administrations. It builds a discussion on issues that may support the development of solutions to improve operational management and perform a better change management in the public sector: if the awareness about the abovementioned dimensions is also raised in the public sector domain, it will be possible to develop better organizational models that balance the satisfaction of public stakeholders and the respect of the principles of performance and efficiency. Third, despite the Italian setting may represent a peculiar case, this study contributes in giving insights in one of the countries belonging to the group of Continental European countries – especially those in the Southern area – less regarded and still under-investigated by the literature.

# Federal Criminal Appeal Process and Social Policy

Randy L. T. Jacobs
Department of Public Policy and Administration, Jackson State University, Jackson, MS, USA

## Definition

Adjudicate: To make a formal judgment or decision about a problem or disputed matter, particularly in a court of law.

Right of appeal: An appeal may be granted as a matter of right, such as from a trial court to an intermediate appellate court or only at the discretion of a superior appellate court.

Jurisprudence: A legal system.

Majority opinion: A judicial opinion agreed to by more than half of the members of the court.

A majority opinion sets forth the decision of the court and an explanation of the rationale behind the court's decision.

Dissenting opinion: An opinion in a legal case in certain legal systems written by one or more judges expressing disagreement with the majority opinion of the court which gives rise to its judgment.

Habeas corpus: A writ requiring a person under arrest to be brought before a judge or into court, especially to secure the person's release unless lawful grounds are shown for their detention.

Writ: A form of written command in the name of a court or other legal authority to act or abstain from acting.

Writ of certiorari: Orders a lower court to deliver its record in a case so that the higher court may review it, at its discretion.

Writ of error: A writ issued by an appellate court to the court of record where a case was tried, requiring that the record of the trial be sent to the appellate court for examination of alleged errors.

En banc: A session in which a case is heard before all the judges of a court (before the entire bench) rather than by a panel of judges selected from them.

Verdict: A decision on a disputed issue in a civil or criminal case or an inquest.

Concurring opinion: An opinion written when a Supreme Court Justice agrees with the majority of the court on the final result, but not on one or more point.

## Introduction

Courts of appeal have existed for centuries. Hammurabi, of the first dynasty of Babylon, and his governors, served as the final Supreme Court of Appeal of Babylon (Dellapenna and Gupta 2009). Ancient Roman law provided for an intricate formally ranked system of courts of appeal, in which some appeals were heard by the emperor (DuPlessis 2015). Courts of appeal existed in Japan from at least 1185 CE; Kamakura Shogunate established the final Supreme Court of Appeal of Japan, known as hikitsuke (Bowman 2013). During the eighteenth century, William Blackstone noted in his Commentaries on the Law of England that during the reign of Edward III of England, courts of appeal existed as a form of error rectification in the common law (Blackstone 1769).

Although courts of appeal existed in many forms throughout history, the right of appeal was fairly recently integrated into criminal jurisprudence. For illustration, the United States first established a system of federal courts of appeal in 1789, but a federal right to appeal was not created until the Congress passed the Judiciary Act of 1879, which authorized appeals in capital cases (Marshall 2011). However, it was not until 1891 that the right to appeal was expanded to include all criminal cases (Levenson 2017). This chapter will explore the development and function of the federal criminal appeal process.

## Federal Criminal Appeal Process as a Social Policy

The losing party in a judgment by a federal criminal district court, in general, has a right to appeal the judgment to the next highest court, which is usually the US Circuit Court of Appeals. However, the prosecutor has no right to appeal a verdict of not guilty but may appeal the sentence. The defendant, on the other hand, has the right to appeal the conviction and the sentence.

The party who files the appeal is the appellant. The appellant has the burden of proof. The appellant must demonstrate to the US Circuit Court of Appeals that the federal district made a substantial legal error, which affected the judgment in the case. The party in opposition to the appeal is the appellee. The appellee must demonstrate that the federal district court was accurate in its judgment or why any alleged error was not substantial and did not affect the judgment in the case.

### Criminal Appeal Basics

An appeal of a federal criminal conviction is a review of the record of federal district court's trial procedure and judgment for error. The US Circuit Court of Appeals may only review the federal

district court's record and cannot consider new trial evidence. The record is a detailed account of the district court proceedings, which includes the court reporter's transcripts and any exhibits or documents entered into evidence.

The appellant must file a brief or written explanation of the errors alleged to have occurred during the trial proceedings. The appellee must also file a brief confuting the alleged error or demonstrating that the alleged error was not substantial. In rebutting the appeal, the appellee contends that federal district court was accurate in its judgment; thus, the conviction and sentence should be upheld.

### Winning an Appeal

Winning an appeal is notoriously difficult, primarily for two reasons. Firstly, the US Circuit Courts of Appeals are decidedly deferential to the judgment of the lower federal district courts, except in cases in which the errors and/or judgments of the lower federal district court are egregious. Secondly, as stated above, the burden of proof is on the appellant to prove that an error occurred and that the error was substantial. Errors that do not impinge on the substantial rights of the appellant are disregarded as harmless error.

### Number of Appeals Overview

As a general rule, the final judgment of a lower district may only be appealed once to the next higher court. Therefore, the total number of appeals is dependent upon the total number of superior courts to the lower district court, which rendered the judgment. The first appeal is the "appeal as of right" (Levenson 2017). The "appeal as of right" entitles the appellant to the assistance of counsel (Levenson 2017).

### Steps in Filing a Timely Appeal: File the Notice of Appeal

Filing an appeal is ordinarily a two-step process. Firstly, file the notice of appeal within 10 days from the date of the filing of the district court's judgment (Levenson 2017). The notice of appeal is filed with the lower district court, which simply notifies the lower district court that the defendant is appealing the case. The US Circuit Court of Appeals may not consider an appeal, if the lower district court has not received timely notice of appeal. Secondly, file the appellate brief with the US Circuit Court of Appeals. As stated above, the appellate brief will allege that substantial error occurred during the trial at lower district court. The appellate brief will include the lower district court's trial record as evidence of the occurrence of the substantial error.

### Grounds for Appeal

Assuming that the error in the trial of the lower district court was substantial, there are four general justifications for appeal:

1. The lower district court made a substantial error of law.
2. The weight of the evidence does not support a guilty verdict.
3. The lower district court abused its discretion in making an erroneous ruling.
4. A claim of ineffective assistance of counsel, under the Sixth Amendment.

### How the Appeal Is Decided

The federal criminal appeal is decided by US Circuit Court of Appeals, which consists of a panel of three judges. As stated above, the US Circuit Court of Appeals may not entertain evidence or hear witness testimony not presented during trial at the lower district court. The judges must make their decision regarding the appeal based solely on the written record of the trial court proceedings, the appellate briefs, and oral arguments, if allowed.

The three judges will then meet and vote on the verdict. One of the three judges will write a majority opinion of the court, announcing the verdict and explaining the rationale for the verdict. If the vote on the verdict is not agreed to by all three the judges, the judge in disagreement may write a dissenting opinion, explicating his or her rationale for disagreeing with the majority of the court. The appellate court may:

1. Uphold or affirm the lower federal district decision, meaning the lower court's decision will stand.

2. Reverse or overturn the lower federal district court decision, meaning the argument of the appellant was successful; there was substantial error in the lower district court's trial proceedings.
3. Send the case back to the lower district court for supplementary action or a new trial.

Ordinarily, the ruling of the US Circuit of Appeals is final; however, on occasion, the appellee or appellant may request a rehearing of the case en banc, which is a rehearing of the case by all judges of the court of appeals in that circuit (Levenson 2017). If the en banc request is permitted, the three-judge panel verdict is removed from the appellate record, and the verdict of the en banc court will replace it (Levenson 2017).

The appellee and the appellant also have the right to appeal the decision of the US Circuit Court of Appeals to the US Supreme Court. However, the Supreme Court, unlike the appellate court, is not obligated to hear all cases. Similar to filing an appeal at the US Circuit Court of Appeals, the appellant will file a petition for writ of certiorari, at the US Supreme Court (Levenson 2017). A "grant of cert" indicates that the Supreme Court will hear the case (Levenson 2017). Also, unlike the three-judge panel at the US Circuit Court of Appeals, all nine justices of the US Supreme Court will hear the case and participate in the deliberation of the final decision or verdict, unless a justice recues themselves, due to a conflict of interest. The chief justice of the Court will appoint a justice to write the majority opinion of the court. The majority opinion announces the verdict of the court and explains the Court's rationale in reaching the verdict. If the verdict is not unanimous, a justice in disagreement with the majority of the Court may write a dissenting opinion, in which he or she explains the rationale for disagreeing. Any remaining justices may join in the dissenting opinion, join in the majority opinion, or write a concurring opinion. A justice writing a concurring opinion agrees with the final verdict but not the rationale for the final verdict. In the atypical occurrence of a tie vote or if the Supreme Court does not "grant cert," the decision of the US Circuit Court of Appeals stands.

## History and Evolution

### An Overview of the History of Federal Criminal Appeal Process

The federal judiciary system is comprised of lower district courts, intermediary circuit courts of appeal, and the Supreme Court of the United States. Federal criminal cases are decided in the lower district courts, and either party has the right to appeal that decision to the circuit courts of appeal and ultimately to the Supreme Court of the United States. Several legal scholars contend that the right to appeal from lower federal district courts to circuit courts of appeal and to the Supreme Court is a "substantive liberty interest"; however, for more than one hundred years of the establishment of the federal court system, there was no federal legislative or constitutional right to appeal in criminal jurisprudence (Stein 1986).

The Judiciary Act of 1789 established the appellate jurisdiction of the US Supreme Court. The Judiciary Act of 1789 authorized the Supreme Court to review writs of error of judgments in civil cases, in which the "matter in controversy exceeds $2,000 in value (Rossman 1990). The Judiciary Act of 1789 did not authorize the Supreme Court to review writs of error in federal criminal cases but it also did not explicitly prevent the Supreme Court from reviewing writs of error in federal criminal cases. Therefore, whether appellants may attain writs of error in federal criminal cases was an unsettled question. However, that uncertainty was resolved in 1805, when a writ of error for a federal criminal conviction came before the Supreme Court. In *United States v. Moore*, John Mason, the appellant, argued that Article III Section 2 of the United States Constitution authorized Supreme Court appellate jurisdiction in all cases of law, subject only to Congress' explicit exceptions (Rossman 1990). Thus, Mason's position was that, the Supreme Court had appellate jurisdiction in both civil and criminal cases, because congress did not explicitly exempt appellate criminal jurisdiction from the Supreme Court.

Moreover, Mason argued, that fourteenth section of the Judiciary Act of 1789, authorized the Supreme Court to issue writs of error in federal criminal cases (Rossman 1990). The Fourteenth Section of the Judiciary Act of 1789 provides that, federal courts have authority to issue all writs "necessary for the exercise of their respective jurisdictions. . ." (Judiciary Act of Sept. 24 1789, ch. 20, sec 14, 1 Stat.8). However, the Supreme Court denied the writ of error, in *United States v. Moore*; Chief Justice Marshall, writing the majority opinion of the court, based the opinion wholly on an interpretation of Section 22 of the Judiciary Act of 1789, which concerns the Supreme Court's authority to issue writs in federal civil cases. Marshall interpreted the grant of authority to issue writs in federal civil cases in Section 22 of the Judiciary Act of 1789, to connote that the Congress did not intend to grant the Supreme Court authority to issue writs of error in federal criminal cases (Rossman 1990). Therefore, after *United States v. Moore*, federal writs of error in all federal courts, including the Supreme Court, were limited to federal civil court cases only.

This limitation on the appellate jurisdiction of federal courts continued until March 3, 1879, when the Congress created a federal legislative right to appeal federal criminal convictions from the federal district courts to the federal circuit courts of appeal (Rossman 1990). Later, the Congress passed the Evarts Act of 1891, which established a federal legislative right to appeal criminal convictions in capital cases or "otherwise infamous crimes" to the US Supreme Court. The Supreme Court construed "otherwise infamous crimes" to mean "all cases in which a penalty of imprisonment was possible" (Levenson 2017).

Although the Congress passed legislation to authorize appeal in federal criminal jurisprudence, this legislation did not create a constitutional or absolute right to appeal federal criminal convictions. This fact was illustrated in the majority opinion of *McKane v. Durston*, a 1894 habeas corpus case; the Court stated "an appeal from a judgment of conviction is not a matter of absolute right, independently of constitutional or statutory provisions allowing such appeal. . .a review by an appellate court of the final judgment in a criminal case. . .was not at common-law and is not now a necessary element of due process of law" (Mckane v. Durston 153 U.S. 684). The Court affirmed its holding in *McKane* in *Jones v. Barnes*, a 1983 habeas corpus case; the Court declared that "there is, of course, no constitutional right to an appeal" (Jones v. Barnes 463 U.S. 745 1983).

Therefore, a review of the legislative history of the Congress and federal law jurisprudence reveals that the right to appeal a federal criminal conviction is a not a constitutional right and it is not a necessary element of the due process of law. The right to appeal a federal criminal conviction is a legislative right, created by the Congress and slowly developed over time. It is indubitable that the original design for the federal court system did not include a right to appeal federal criminal convictions.

## Conclusion

The United States first established a system of federal courts of appeal in 1789, but a federal right to appeal a criminal conviction from federal district courts to the US Circuit Court of Appeals was not established until March 3, 1879 (Rossman 1990). Later, the Congress passed the Evarts Act of 1891, which established a federal legislative right of direct Supreme Court review of capital cases or otherwise infamous crimes (Kane and Wright 2002). Although the Congress passed legislation to authorize appeal in federal criminal jurisprudence, this legislation did not create a constitutional or absolute right to appeal federal criminal convictions.

Through federal legislation, the losing party in a judgment by a federal district court has a right to appeal the judgment to the US Circuit Court of Appeals. The party who files the appeal is known as the appellant, which has the burden of proof. The appellant must demonstrate to the US Circuit Court of Appeals that the federal district made a substantial legal error, which affected the

judgment in the case. The party opposing the appeal is known as the appellee. The appellee must demonstrate that the federal district court was accurate in its judgment or why any alleged error was not substantial and did not affect the judgment in the case.

Ordinarily, the ruling of the US Circuit of Appeals is final; however, every now and then, the appellee or appellant may request a rehearing of the case en banc, which is a rehearing of the case by all judges of the court of appeals in that circuit (Levenson 2017). If the request is granted, the three-judge panel verdict is vacated from the appellate record and the verdict of the court en banc is entered.

The appellee and the appellant also have the right to appeal the decision of the US Court of Appeals to the US Supreme Court. In the atypical occurrence of a tie vote or if the Supreme Court does not "grant cert," the decision of the appellate court stands.

The federal right to appeal a federal criminal conviction is a legislative right, not an absolute right or constitutional right. It is indubitable that the original design for the federal court system did not include a right to appeal federal criminal convictions. However, a review of federal criminal convictions has become a mandatory attribute of federal law jurisprudence.

The order in which state bureaucracies and democracy occur in nations has a tremendous impact on political development. Approximately 2,200 years ago, the Ch'in dynasty (221–206 BCE) created a centralized unitary state in China, and the subsequent Western Han dynasty (206 BCE–9 CE) introduced a civil service and examination system to guide it (Raadschelders 1998). Both occurred long before any effort at democracy. Consistent with Confucian principles of hierarchy, the state was to be run by a cadre of meritorious elites, defined – and selected by civil service exam – as those steeped through education in the history and culture of China. In today's vernacular, these elite mandarins in nondemocratic societies were generalists rather than specialists.

Centuries later, European nations (Austria-Hungary, France, Prussia, and, later, Germany under Bismarck) and the British took a similar perspective, the former emphasizing elite legal expertise and the latter a general liberal arts education. Members of the Parliament could hold both elected office and be ministers in the government, thus centralizing rather than diffusing state power. Elite schools of public administration were also established to lead and staff the career civil service (e.g., the École Nationale d'Administration in France and the University of Oxford and the University of Cambridge, or "Oxbridge," in Great Britain).

In contrast, a decidedly different pattern emerged and evolved in the United States, where democracy (albeit flawed) evolved largely before the creation of a national state bureaucracy. Reflecting its democratic heritage, state power was defused in the American system of separate institutions sharing power, checks and balances, a bicameral Congress, and federalism. Moreover, the constitution precluded anyone from simultaneously holding a seat in Congress and in the executive branch of government. Nor initially was the federal bureaucracy seen as vital to governance. During the eighteenth century and most of the nineteenth century, positions in the bureaucracy were seen as the property of the white male socioeconomic elite and, subsequently, as succor to be doled out by political parties on the basis of loyalty. It was only in the late eighteenth century and early twentieth century that the idea of merit gradually took hold. In 1883, Congress enacted the Civil Service Act, and in 1887, future US President Woodrow Wilson called for borrowing European principles of administration and applying them to government agencies. Likewise, the idea of running government bureaucracies on business principles after decades of corruption and inefficiency informed the reform agenda of the early progressives in America (1887–1920).

As the federal government grew in size in the twentieth century and Congress granted greater discretion for making policy to federal agencies, further calls ensued for shifting power from the Congress to the executive branch. However, Congress also tried to increase its ability to hold the federal bureaucracy accountable for its actions by creating the Administrative Procedure Act of 1946, forming permanent legislative oversight committees and exercising its traditional power of the purse. Also unlike in Europe, preparation for the public service started early as in-house training, then continued as hands-on training in bureaus of public administration, and later carried into university curricula. Moreover, no single elite school was created to prepare students for public service, and today, nearly 280 universities offer various degrees for these purposes. Additionally, a variety of professions (e.g., law, engineering, social work) enter the federal service without any formal education in public administration.

Americans also have tended to have less respect for, and deference to, the judgments of the federal bureaucracy than citizens in parliamentary systems. This stems partly from the nation's founding experience, premised as it was on the abuses of Britain's colonial administrators as they implemented the King's policies. Yet it was also, again, a product of democracy preceding the founding of a national state apparatus in America, as well as Americans' self-conception of their nation as a commercial republic premised on individualism, limited government, minimal intervention in markets, and volunteerism. This self-conception has resulted in efforts to limit the visible size of government by relying on American states, the private sector, and nonprofits to do what state agencies in Europe typically have done directly. It has also meant that the United States has exhibited much more of a reliance on regulation of business, as well as on the federal courts, to refine over time the interpretation of the substance and scope of federal power.

What each of these nations *has* effectively agreed on by their actions is the centrality of public management to good governance. In the United States, as new public problems are identified, the size of federal bureaucracy has changed, as have both the nature of federal agency responsibilities and the levels of professionalization needed to fulfill them. As late as the 1930s, the federal spending was less than 3% of the US gross national product (GDP). In 2014, it was approximately 20% of GDP, after peaking in 2011 at 24%.

The historical average since 1963 has been approximately 19%.

Today, the federal government has approximately 180 agencies that have produced more than 170,000 pages in the Code of Federal Regulations. Annually, anywhere from 2,500 to 4,500, rules are issued by regulatory agencies. Significant enough in their own right, these rules require further interpretation by agency managers. The two most common approaches involve the use of (1) "guidance documents" (or "interpretations") from the Office of Management and Budget to agencies and from agencies to regional offices and (2) "compliance manuals." The former advise agencies on how to interpret regulations for regulatory targets, while the latter tell enforcement personnel how to do their jobs. Importantly, each changes over time to reflect White House priorities.

Although the reach of government has expanded significantly, the federal workforce has not. Currently, approximately two million individuals are employed in the civilian workforce, excluding the 500,000 persons who work for the US Postal Service and undisclosed staff levels for national security agencies such as the Central Intelligence Agency. In the past decade, federal employment has increased by some 200,000, with the most expansion in national security agencies. Over the past half-century, however, the number of federal employees has been flat, while federal spending has quintupled. In 2015, both houses of Congress included provisions to shrink the size of the federal civilian workforce even further. In the process, many former federal responsibilities have been further pushed upward to international bodies, downward to states and localities, and outward to the private and nonprofit sectors.

At the same time, the nature of the responsibilities of federal agencies has changed. Prior to the 1960s, federal agencies not involved in regulation or national defense were involved in the direct delivery to citizens of goods, services, and opportunities. In contrast, today's federal civilian workforce functions in four major areas: determining and allocating subsidies, transferring money to state and local governments intergovernmentally, allocating and monitoring grants and contracts to private and nonprofit actors, and regulating business (DiIulio 2014).

Consequently, the federal workforce today is much more highly professionalized than in the mid-twentieth century, as well as relative to the private workforce (making salary comparisons a tricky proposition). It is also much more appropriately characterized as a "plural" civil service system rather than a unitary one. As the inflexibility of federal civil service regulations has become clear, many agencies and job categories have relied on an exempted service to meet their needs. Merit principles are in effect, but hiring, salary, and special needs adjustments are made (e.g., in the State Department and the Central Intelligence Agency).

With federal agencies wielding various kinds of policymaking authorities, holding them accountable for their actions is imperative. Partly, again, because democracy preceded the building of a centralized bureaucratic state in America, federal agencies have historically been viewed as "tools" or "instruments" of elective officials (Cook 2014). This has happened despite their performing an essential policymaking role in governance as they implement often vague, ambiguous, and contradictory federal statutes.

Major efforts have occurred in the twentieth and twenty-first centuries to "control" the discretion of civil servants in federal agencies. Some have been initiated by presidents (e.g., the Budget and Accounting Act of 1921, the two Hoover Commissions in 1948 and 1952, and President G.W. Bush's President's Management Agenda [PMA], with its accompanying focus on the Performance Assessment Rating Tool or PART), others by Congress (e.g., the Government Performance and Results Act [GPRA] of 1993 and the Chief Financial Officers Act of 1990), and still others jointly. If reformers do not like the way federal agencies are exercising their discretionary authority, the "solution" tends to be more bureaucracy, more astutely applied, and achieved in a dysfunctional "one-size-fits-all" approach. Alternatively, various federal activities are contracted to private or nonprofit actors or devolved to the states.

The rationales for federal administrative reform typically fall into four categories (Light 2006). Some – such as the Budget and Accounting Act of 1921 and the Clinger–Cohen Act of 1996 creating chief information officers in agencies – have been heralded as focused on achieving greater efficiency and effectiveness through the application of scientific management and information technology principles. Others – such as the Whistleblower Protection Act of 1989, the recommendations of the Ash Council and the Grace Commission in the 1970s and 1980s, and various federal reorganization plans over the decades – claim to focus on gaining economy (less spending); reducing waste, fraud, and abuse in agencies; or eliminating overlap and duplication of federal agencies or programs. Still others – such as the Legislative Reorganization Act of 1949 (and its successors), the Inspector General Act of 1978, the Chief Financial Officers Act, and the Congressional Review Act of 1996 – are justified as enhancing the transparency of agency operations to congressional and presidential oversight. A number – such as "reinventing government" in the 1990s and, as noted, the PMA and PART – aim at enhancing agencies' performance by evaluating them on their commitment to strategic planning and policy outcomes or "results."

Fundamentally, however, most reform movements are animated by considerations of power, access, and influence. As one scholar famously asked, "Whose bureaucracy is this, anyway?" (Rourke 1993), because both members of Congress and presidents seek to influence the ways in which federal agencies exercise the discretion granted to them by statutes. With the political and material stakes of these decisions often substantial, the federal bureaucracy as a whole becomes a battleground for control between the White House and the Congress, with the federal courts called on to resolve many of the disputes that arise between them.

Challenging enough as a context for federal executives trying to lead or manage these agencies while remaining responsive to multiple elected officials, interest groups, and competing values, they must do so today amidst a political zeitgeist that demeans public service and that favors such things as federal pay freezes, benefit cuts, restraints on collective bargaining, and at-will employment. Meanwhile, federal executives – alone or in cross-sectoral networks – must deal with the stop-and-go nature, uncertainties, and disruptions of the congressional budgeting process. Always difficult, this situation has been complicated further in recent years by repeated threats to shut down the federal government for various political causes (e.g., debt-ceiling limits and Planned Parenthood funding).

As such, this "compensatory" state (Eisner 2000) – a state wherein federal agencies must rely on "third-party" actors to fulfill their legislative mandates – creates a situation where federal executives must learn to "network in the shadow" of inflexible rules and "stovepiped" federal bureaucracies (Scharpf 1997). In terms of inflexibility, for example, rules for receiving intergovernmental categorical grants often make it hard, if not impossible, for agencies at all levels of government to address public problems effectively. Stovepiping is the tendency for agencies and programs within and across the federal government to become insular in their thinking, to hoard information, to reject policy ideas developed by other agencies, and to resist working with other government agencies. These "bureaupathologies" are the product of a series of perverse incentives, including a congressional oversight process that focuses on individual programs, a federal budgeting process that pits agencies and programs against each other in a zero-sum competition for resources and influence, and the risks of being held accountable for outcomes they cannot control or that are performed by agency partners.

Collectively, these interrelated long-term trends show no signs of abating in the near term. Consequently, they pose significant challenges, choices, and opportunities for federal executive management in the years to come. Particularly noteworthy are the prospects for the perdurability of toxic ideological politics, a cacophony of competing interest groups in issue networks, a competing set of institutional overseers seeking responsive competence rather than neutral competence, long-term financial and human capital resource constraints, the need for civil service

system reform, and a Janus-faced information technology (IT), cybersecurity, and social media environment. These will produce persistent pressures for major federal management reforms and will require federal management leaders to hone several skill sets. Historically, the responsibilities, skill sets, and normative criteria for federal executive management have departed substantially from those of private sector executive management. Over the past three decades, and likely to continue into the future, there has been a concerted effort to apply the latest business innovations to government agencies, as well as to their nonprofit sector partners. This "logic of business," however, often runs directly into the realpolitik of differences in executive management between the private and public sectors.

## The Perdurability of Toxic Politics

Today, many rue the legislative gridlock that a de facto "responsible party" system has wrought. The development of ideological parties with distinct programs and priorities has occurred without a commensurate change in the institutional structure of our Madisonian system of separate institutions sharing power, checks and balances, bicameral legislatures, and federalism. We are left with European-style parliamentary parties unwilling to compromise on their defining issues but operating in a Madisonian system where compromise is usually necessary to get anything done (Mann and Ornstein 2012).

Further reinforcing this tendency are residence patterns in the nation today. Researchers find that the American electorate has "sorted itself out" geographically, with those sharing social, political, and economic views clustering together. Not only do they then vote in similarly striking ways, but they tend to avoid contact with others holding different opinions. Media segmentation (e.g., liberal and conservative "news" shows) that allows voters to avoid opinions differing from their own exacerbates this problem and reinforces existing biases among voters.

Taking advantage of this residential sorting, both political parties use computer programs to draw favorable congressional districts for themselves after each decennial census when they control state legislatures. In effect, candidates can now choose reliably partisan districts in which to run, thus nearly guaranteeing their election and reelection. In these safe Democratic or Republican districts, primaries become more important than general elections, because the minority party often struggles to find quality candidates to run in general elections. Primary voters, however, tend to be the most committed voters politically and ideologically, meaning that those elected from safe districts need only play to their primary electoral base once in Congress. This makes them decidedly less willing to compromise over issues in Congress, because compromise can jeopardize their chances with primary voters the next time around.

Consequently, federal executives must learn how best to hire, train, promote, and retain talented federal employees in an inhospitable political climate wherein elected officials and segments of the public demean public servants. Relatedly, they must enhance strategic human capital planning (SHCP) that embraces both racial, gender, and ethnic diversity and the millennial generation (persons born between 1982 and 2004) who have very different work expectations than prior generations. Making this transition offers opportunities for policy and program change and resetting agency program priorities as employees retire. However, it also risks a loss of institutional memory as retirees leave who hold critical positions.

## A Cacophony of Competing Interests

During the Progressive Reform Era (1887–1920), most of the founders of American public administration believed that politics *should* be separated from administration as much as possible. However, they realized that, in practice, it never *could* be totally eliminated. The founders' concern, then, was *where* politics would happen to best advance the public interest: in the legislative or the executive branch of government. Most came down on the side of shifting the focus on politics

to the executive branch because of the inefficiency and corruption rampant in Congress, state legislatures, and city councils due to party machines. Although presidents were also elected, the founders argued that they were more likely to pursue the public interest rather than particularistic ones, as they alone were elected by all citizens (rather than merely congressional districts).

Nor did they see shifting power to unelected experts in the executive branch as a threat to democracy, because politics and administration could be separated. The "politics–administration dichotomy" asserted by most claimed that politics took place in the legislative branch as statutes were enacted and that agency administrators merely executed the will of legislatures as they implemented statutes. As Woodrow Wilson put it in 1887, public administration was a field of business and should be driven by business principles, not political machinations.

However, implementing statutes is itself making policy because of the discretion administrators wield in determining, in this case, congressional intent and the best ways to carry it out. Politics, in turn, follows discretion. Thus, by the early 1950s and 1960s, scholars and observers acknowledged that politics (in the form of interest group pressures) was a central component of federal executive management. Specifically, they argued that "subsystem" politics drove this process in regulatory agencies, with "iron triangles" as the earliest manifestations of development. Iron triangles were comprised of cozy relationships that developed between agencies, interest groups affected by agency decisions, and legislative oversight committees charged with overseeing agencies (Redford 1969). Policy bubbled up from these whirlpools of cozy relationships, and it was in the interests of members of iron triangles to keep conflict low among themselves lest other actors with different values became involved.

Indeed, some scholars pointed out the necessity for agencies to develop these kinds of relationships if they were to survive and effectively pursue their policy responsibilities. Norton Long (1949) famously wrote that "power is the lifeblood of administration." Agencies that failed to develop and increase close ties to interest groups and other stakeholders were destined for underperformance, if not failure, because no central point of hierarchical authority existed in the Madisonian system that could coordinate federal government initiatives and resolve agency disputes. Moreover, competition among these subsystems could, and would, afford a kind of coordination among agencies.

However, three things happened. In the short term, regulatory agencies were "captured" by the interests they were supposed to regulate (meaning that they were controlled by the interest groups involved), and the "stovepiping" of agencies and programs occurred. In the longer run, replication of programs developed across federal agencies as various interest groups sought redress for their narrowly tailored needs. For example, today, federal job training programs, each with their own narrow focus and interest group constituencies, can be found across over 60 federal agencies. Moreover, efforts to consolidate them have largely failed because of resistance from affected interest groups and agencies.

By the late 1970s, the idea of "issue networks" began to replace iron triangles and agency capture as the dominant metaphor portraying subsystem relationships in the federal government (Heclo 1977). Issue networks depict the reality that agencies are overseen by a number of congressional committees, often with diverse preferences, and that the interests surrounding various policy issues both splintered and expanded exponentially during the 1960s. For example, although agricultural interest groups once dominated food stamps and farm subsidies, by the 1970s, these were also drawing the attention of health and nutrition groups that tried to influence agency discretion. The concept of issue networks had major consequences on both the political and administrative leadership of federal agencies.

Others described a "new partnership" comprised of congressional committee staff, agency program managers, and liberal-minded judges and created to protect and expand programs in the face of Reagan administration cuts (Melnick 1985). Additionally, by the 1990s, others identified "advocacy coalitions" as the dominant drivers of agency programs and policy agendas (Sabatier

and Jenkins-Smith 1993). These consisted of enduring networks of interacting interest groups, agency bureaucrats, journalists, academics, and public managers who, over time, developed core beliefs and ways to approach problems.

For the career bureaucracy, these developments meant that the prior influence of mid-level public managers in closed subsystem politics was reduced significantly. Policy knowledge supplanted pure administrative skill as the coin of the realm. Moreover, policy knowledge extended beyond agencies to the thousands of policy think tanks in Washington, removing the near monopoly agencies previously had on policy analysis.

## Competing Sources of Institutional Control of the Federal Executive Branch

Neither presidents nor the Congress sat by idly and watched these developments occur; nor will they in the future. They "coevolved" to develop tools of their own to reassert their often competing policy agendas. Their effectiveness notwithstanding, these tools further complicated executive management in federal agencies. Presidents have centralized policymaking related to their various priorities into the Executive Office of the President, as well as into the White House itself. They have done so, for example, by creating clearance processes for regulations in the Office of Information and Regulatory Affairs in the Office of Management and Budget. They have also centralized key personnel appointment decisions in the White House Office and have sometimes developed domestic and national security policies without departmental input. This so-called institutional presidency is now itself highly bureaucratized and laced with turf wars, information hoarding, and internecine conflicts. It also creates morale problems in agencies, along with tensions and resentments between the White House and agencies.

Beginning with the Nixon presidency, the institutional presidency has been complemented by the "administrative presidency" (Durant 1992; Nathan 1983). This strategy is premised on the idea of using presidential appointees (roughly 3,000 today) to advance a president's policy agenda administratively, instead of legislatively, or in conjunction with a legislative strategy. These appointees try to advance presidential policy agendas by aligning agency structures, decision rules, personnel policies and evaluations, and budgets with them. Specifically, they try to impose more limits on bureaucratic discretion, cut or increase program budgets or rates of spending, alter behavior through performance appraisals, reorganize agencies to give less authority to those opposing their policies, or leave program leadership positions vacant.

In doing so, presidents have used a key component of the Civil Service Reform Act (CSRA) of 1978: the Senior Executive Service (SES). The SES was established for a variety of management purposes, including creating an elite cadre of generalist executives that could move from agency to agency, broadening the perspective and interagency contacts of SES members to reduce stovepiping, and rewarding and retaining talented federal managers by instituting a bonus system for outstanding performance. However, it was also designed to increase responsiveness to presidents by allowing one-tenth of all SES members to be political appointees, placing appointees deeper into agencies than previously possible, and letting them evaluate the performance of career civil servants (e.g., with pay-for-performance systems).

The straightforwardness of the logic of the administrative presidency strategy belies the hurdles that it encounters in practice, however. Researchers suggest that administrative strategies are neither as powerful as their proponents hope nor as powerless as opponents predict. Collectively, they have found that bureaucratic responsiveness to contextual tools wielded by political appointees is contingent on a variety of factors (e.g., Durant 1992). Success in advancing presidential agendas is more difficult when the following conditions exist: the greater the extent of change required, the less clear presidential goals, the more controversial the agency or program involved, the more misaligned agency reward systems, the less professionalized the agency,

and the more opportunities for private sector employment.

Unpacking these points, prior research shows that reorganizations can advance presidential goals (Lewis 2008), but they are disruptive to agency operations and, thus, can delay or permanently foil presidential goals. At the same time, existing organizational structures are not efficient or goal related but, rather, are "treaties" reflecting the results of past agency battles over policies. Thus, when reorganizations are launched, the scars of past agency battles can rise to the fore again, rallying subsystem actors who stand to lose access, influence, and power. In doing so, they can delay or derail implementation of presidential goals (Seidman 1998), as well as other ongoing agency programs. Consequently, when appointees try to reorganize in order to implement presidential agendas administratively, they are, in effect, trying to reorganize congressional oversight systems as well. Hence, even if successful, reorganizations bring little behavioral change as long as congressional oversight committees remain the same, as they have since the massive reorganization that created the Department of Homeland Security after the 9/11 terrorist attack.

Moreover, although presidents have intensified efforts to politicize the career bureaucracy, politicization can be problematic. For example, as presidential loyalists are placed deeper into agencies, the relatively lower pay makes it likely that younger and more managerially inexperienced persons will be appointed. This, in turn, means that they will be vulnerable to the strategic and tactical mercies of more experienced civil servants, turn over more quickly in their positions as they seek swift advancement up the hierarchy, and want quick accomplishments to boost their chances of moving up the chain of command. These traits often reduce respect for appointees by careerists and create frustration for program managers. Finally, the greater the number of political appointees in an agency, the greater the levels of hierarchy, and the less control presidents and their appointees have over implementation of their policy preferences.

Many of the SES's aims have also been sorely compromised, if not undermined, in the decades since. For example, the awarding of bonuses has been undercut by both congressional reneging on the size of bonuses and subsequent gaming of the award system in some agencies. Some presidents have used the SES as part of a broader strategy to politicize the federal bureaucracy. Most research suggests that pay-for-promise has not worked, works only under particular circumstances that are difficult to bring about in the public service, is counterproductive for team-based projects, and runs counter to professional norms and public service motivation. In addition, federal employees eligible to join the service find it increasingly unattractive to do so. As such, the diversity of the SES needs continuing improvement, salaries commensurate with responsibilities and comparable positions in the private sector, and a more appropriate balance between political and careerist influence over policy. At the same time, advances in succession planning in the wake of an aging SES workforce are critical.

But perhaps the most decisive constraint on the success of these tools is the reality that agencies have multiple actors overseeing agency structures, budgets, personnel regulations, and decision rules. These include the power of the purse, normal oversight and investigations, legislative reports that stipulate congressional preferences rather than a president's agenda, and review of agency rulemaking. Additionally, were these powers not enough, the power of judicial review of agency regulations is omnipresent. Nor, in the wake of these presidential actions, has the Congress been shy about passing legislation to increase the transparency of agency operations.

For example, the GPRA of 1993 and the GPRA Modernization Act of 2010 both require federal agencies and state and local recipients of federal funds to engage in strategic planning, review progress toward meeting agency goals, and report and make use of performance data. Policy-specific changes in areas such as welfare (the Personal Responsibility and Work Opportunity Reconciliation Act of 1996) and education (the No Child Left Behind Act of 2002 and the Race to the Top initiative of 2009) further encourage the use of performance measures that allow enhanced congressional oversight of presidential

initiatives. To these must be added a variety of other congressional statutes that open up the actions of presidents to congressional scrutiny, including the Inspector General Act of 1978 and the Congressional Review Act of 1996. Thus, agencies sometimes are more responsive to congressional direction; to multiple principals (including the courts) rather than to just presidents and their appointees; to interest groups, subnational actors, and local contexts rather than to political appointees; and to either the Congress or presidents, depending on policy domain (e.g., domestic, foreign, or intermestic).

With partisan polarization rising in Washington since the 1980s, the power of presidents to bargain with Congress has diminished and has pushed them into greater use of the unilateral powers they have under the US Constitution. These include the use of executive orders, presidential signing statements, national security directives, and (less so) presidential proclamations. The second term of the Obama presidency, for example, has seen a major, albeit controversial, application of unilateral tools (e.g., regarding immigration and climate change). Yet the president's actions are consistent in many ways (but not all) with the way his recent predecessors have relied on unilateral tools to advance their policy agendas. What is different is the way he has urged agencies to look for opportunities to advance his priorities within the confines of their existing authorizing statutes and in controversial interpretations of their authority to act that have found their way to courts for resolution.

Evidence exists that first-mover advantages occur for presidents when using unilateral powers (Howell 2003), but they also have shortcomings. Executive orders may require a reprogramming of funds that is politically difficult and may harm other programs that are valued more by members of Congress or the president. Members of Congress on key oversight committees may effectively resist them, for example, by not funding their implementation. Moreover, executive orders can be summarily reversed by their successors. In addition, unilateral initiatives are frequently challenged as giving inordinate – and even unconstitutional shifts in – power to presidents. Regardless, they pose significant challenges for federal executive management. They can cause disruptive stops and starts in policy implementation, incur heavier-than-normal congressional and interest group scrutiny, and threaten reallocation of resources when they fall outside normal budget cycles.

## Fiscal Stress, the Gray Dawn, and a Blended Federal Workforce

For several decades, the federal government has not been able or willing to raise enough money to pay for what it spends. This has produced what some scholars have called a movement from a "tax state" to a "debt state" to a "consolidated state" in the United States (and worldwide) wherein financial market preferences and concerns trump social values of democratic institutions (Streeck 2014). Downward pressures from international financial markets on the visible size of governments combined with antitax sentiments and polarized politics in the United States to trump fiscal prudence. Unfortunately, this has occurred as the responsibilities assigned to federal agencies have spiraled, as social problems have grown more complex to understand and address, and as large numbers of federal civil servants with critical skills and institutional memories are expected to retire. These factors, along with the political ascendancy of neoliberal economics and its neomanagerialist equivalent – the New Public Management – have produced growing levels of contracting out in the federal government over the past several decades.

Overall, the US national debt stood at approximately $7.3 trillion in 2004, rose to about $10 trillion in the Great Recession of 2007–2009, was $18.2 trillion in late 2015, and was projected to reach $21 trillion by 2019. This is the case despite economic recovery from the Great Recession, lower-than-projected costs in healthcare, and across-the-board cuts in the federal budget under sequestration (excluding, e.g., entitlement programs such as Social Security and Medicare). All slowed the rate of annual deficits down somewhat. Yet factors such as an aging population with

medical and social service needs, as well as the war on terror, mean that structural deficits will continue to put the economy – as well as domestic agency budgets – at risk. The Congressional Budget Office estimates that, if no changes are made to existing spending and tax revenue trends, the federal budget in 2025 will be able to finance only interest payments, Medicare, Medicaid, and Social Security (Gorman 2012). In the midst of these trends, massive income inequities have also occurred, to the benefit of the top one percent of earners in the country.

The implications of these budget and social equity concerns are profound for federal executive management. Stagnant wages for working and middle-class workers can lead to greater demands for government redress. Structural deficits mean that nearly three-quarters of the federal budget are in so-called uncontrollable "entitlement" spending categories (e.g., Social Security, Medicare, and veterans' pensions) and used to pay off interest on the national debt. None of these programs go through the annual authorization process, as do domestic agency budgets, defense discretionary funding, and federal intergovernmental aid. Thus, although individual agency budgets may increase or decrease, domestic agency operating budgets and intergovernmental programs have borne the burden of spending cuts over the past three decades.

Congress has also repeatedly put hiring caps on federal agencies in an effort to cut costs and further reduce the visible size of the federal government. It is also common for congressional proposals not to replace all federal retirees projected to leave federal agencies (e.g., hiring one person for every two retirees). Approximately 263,000 federal careerists were 60 years of age or older in 2012, and these numbers will continue to grow in the years ahead. Moreover, roughly 650,000 federal workers are in their 50s. Historically, federal employees in their late 50s leave the civil service soon after becoming retirement eligible. In 2016, for example, nearly 45% of employees at the Department of Housing and Urban Development and the Small Business Administration are eligible to retire, while two-thirds of all administrative law judges reviewing disability claim decisions at the Social Security Administration are eligible to do so.

Consequently, since the 1980s, federal agencies have had to turn to private and nonprofit contractors to compensate for their staffing shortcomings and deficient skill mix. Contracting was also a major ideological staple of conservatives and the aforementioned New Public Management. These critics portrayed federal agencies as monopoly providers of services. Thus, competition for contracts would reduce employee costs, as well as the total cost of service provision. It would also decrease agency inefficiencies, increase agency responsiveness to citizens (redefined as customers), force agency priority setting, and enhance agency learning. Others less critical of federal agencies argued that contracting made sense under certain circumstances (e.g., when agencies could not compete with the private sector for talent and when the need for their services was temporary or cyclical).

Contracting quickly expanded from its historical focus on buying products from the private sector to include buying services (e.g., providing IT services) and even inherently governmental functions (e.g., interrogation of terrorist prisoners) – to the concern of many. The apogee of the contracting movement occurred during the George W. Bush administration in the 1990s, with contracting consuming approximately a quarter of federal discretionary spending (GAO 2006, p. 1). However, questions about the claimed benefits of contracting out, as well as concerns about service quality, have prompted a rethinking of contracting out and a movement toward what is known as "insourcing" of previously privatized functions and services. For example, the Obama administration has tried to insource some previously contracted work, with some success at agencies such as the Internal Revenue Service, the US Army, and the Department of Homeland Security. But given underlying trends, it remains likely that contracting will be a fact of life for the foreseeable future in the federal government, as well as among its state and local partners.

All this offers opportunities for federal agencies to restructure, resize, and reskill their workforces to comport better with today's policy and

implementation needs. Turnover in agencies may facilitate IT modernization not embraced by older employees, may help abandon dated policies, and may make agencies more efficient. However, these trends collectively also pose significant challenges for federal executive management. Notably, they have created recruiting, operational, and morale problems for federal agencies. With public service sold as performed in both the private and public sectors, and with pay and benefits often higher in the former, recruitment of highly talented individuals to federal agencies has become challenging.

Operationally, contract monitoring in the federal government is woefully inadequate relative to the size of the contracting task, risking waste, fraud, and abuse. Better monitoring is imperative and will involve increased numbers of monitors and removal of career disincentives to becoming contract monitors. Also in need of addressing are the morale challenges that arise from a mixed workforce wherein higher-paid private contractors work side by side with federal employees.

## Reform of the Federal Personnel System

A 2014 report by the prestigious Partnership for Public Service argued that the federal civil service system was "obsolete and in crisis, and an obstacle rather than an aid in attracting, hiring, retaining and developing top talent." The most significant piece of federal legislation dealing with merit today is the aforementioned CSRA of 1978. Specific criticisms and reform proposals are multiple and come from both friends and foes of activist government.

Some rightly criticize the inflexibility of the system and inordinate time delays in hiring, meaning that top-notch candidates are often lost to the private sector. The CSRA made some provisions for decentralizing personnel management authority to agencies, especially in evaluating and rewarding employee performance. But it was during the 1990s under the Clinton administration that decentralization of personnel authorities was pushed most aggressively by the White House out into agencies and programs. Then, in 2002 under the George W. Bush administration, the Chief Human Capital Officers Act was passed. Among other things, it gave "direct-hire authority" to agencies. This meant that they could hire outstanding candidates without following civil service regulations. Almost immediately, the rate of direct hiring in agencies tripled, and it continues to be very popular.

Efforts were next made during the Obama administration to speed up hiring. For example, efforts were made to move toward a "category-rating" approach rather than the historic "rule-of-three" approach. The former allows agencies to avoid having to select from only the three highest-scoring applicants. In addition, the administration's Hiring Reform initiative overhauled the federal hiring process. Among other things, the Office of Personnel Management moved to a résumé-based system, eliminating the "KSA essays" (knowledge, skills, and abilities). Launched, too, was the Pathways Programs, which were designed to recruit new agency talent by creating clear pathways to federal service for students and recent graduates. Targeted were "mission-critical jobs and professional careers where there are skill gaps."

A second major criticism of the federal personnel system is that its pay classification position system poses obstacles for the hiring and reward process. Pay classification systems in the federal government originated in the Classification Act of 1923 and have long dominated public personnel management in the United States. They were an effort to take power away from corrupt political machines and their minions in Congress. The act established the principle of classifying similar jobs together, standardizing pay for those positions, and providing common rating systems for performance. It also established the principle of rank-in-the-position (rather than in-the-person). However, problems in implementing the act led to the Classification Act of 1949. This act reduced the number of pay systems to two: the GS (general schedule)-1 to GS-8 categories for white-collar workers and a separate one for blue-collar workers. Moreover, levels GS-16 to GS-18 were called "supergrades" and were reserved for top career civil servants. The CSRA of 1978

eliminated the then highest three pay grades (or "supergrades") in the GS system – GS-16 to GS-18 – and created the SES. Thus, today, the federal GS consists of 15 pay grades for white-collar workers, over 450 job categories (or "series"), and ten steps for within-grade pay increases.

The GS system has long been criticized as an obsolete approach to job and pay classification. In a 2002 report, for example, the Office of Management and Budget identified the GS as a "system whose time has come, and gone" (p. i.). The report noted that at the time the Classification Act of 1949 was enacted, "over 70 percent of Federal white-collar jobs consisted of clerical work" that was easy to classify (p. i.). But for decades since, "knowledge work" has dominated public employment, and these jobs are less well defined and distinguishable from others. Prominent critics also charge that the rigid nature of the GS system impedes organizational change.

Solutions offered to this problem include "broadbanding" – that is, combining and reducing the number of pay grades – and eliminating automatic step increases within GS levels that are based on length of service rather than performance. In a 1995 publication, the National Academy of Public Administration noted that "broader bands allow managers to shift their workforce to new roles more easily" (p. 1). Broadbanding obviates the need to make fine distinctions in levels of job difficulty and responsibility, and federal managers can play a larger role in classification decisions. It also provides recruitment advantages, as qualified recruits can be offered salaries anywhere within the specified range rather than only at step one of the position grade. Yet another criticism of the GS is that it is insufficiently sensitive to the market because of its focus on "internal equity" rather than external job markets.

A third major criticism of federal personnel management systems is that personnel decisions are not well linked to agency missions and trends. To remedy this, critics recommend movement toward SHCP, especially in the face of the graying of the federal workforce. Human capital plans, in turn, are defined as a "coordinated set of actions aimed at integrating an organization's culture [symbols, norms, and underlying beliefs], organization [structure and job roles], people [skill and competency levels and potential], and systems [human resource management or people-focused mechanisms]" (Selden 2009, pp. 20–21). The SHCP seeks to link in greater detail for the human resource management function the larger goals enumerated in the agency's strategic plan.

Specifically, SHCP means doing analyses of (1) the skill or competency mix that presently exists in agencies; (2) the competencies needed to effect the plan; (3) the difference between skills and competencies needed and those available; (4) the short, medium, and long-term (10-year) strategies for closing those gaps and aligning human capital systems with goals; and (5) the status of implementing the plan and adjusting it where necessary in light of obstacles that are arising and changes in the environment (Selden 2009, pp. 23–24). This means that the traditional responsibilities of personnel specialists in public agencies – job and pay classification, hiring, discipline, performance evaluation, training, and retirement – are consciously integrated with agency goals, thus making personnel offices co-workforce planners, collaborators, and partners with agency leadership. This is a major change that has so far met resistance, as human resource offices traditionally have been regarded as "police officers" protecting merit and as isolated from programs and their planning.

Finally, overlaying these challenges is the need to improve representation of the racial, ethnic, gender, and LGBTQ community among the federal workforce and agency contractors. Some progress will occur naturally as the pool of recruits changes to reflect demographic changes underway in the nation. Although the federal government does better than the private sector as a whole in representing groups that have been discriminated against in the United States, it still needs higher levels of representation in the upper management and, as noted, in the SES. Thus, concerted efforts will have to be made by federal agencies to identify and hire qualified minorities and women, retain them, and ensure advancement opportunities for them. Diversity management skills will also have to be valued in federal

executive management given cultural differences among federal employees.

This is not merely an exercise in social engineering. Not only does it not make sense to limit the federal governments' recruiting pool of applicants for non-job-related reasons. Researchers also find mixed evidence of a positive relationship between the percentage of women and minorities in agencies and agency responsiveness to the needs of women and minorities. Mixed evidence also exists that the higher the proportion of minorities and women in some agencies, the higher the perceptions of service quality for relevant groups (e.g., rape victims). Greater diversity has also been linked to better agency outcomes for historically disadvantaged groups (e.g., school graduation rates).

## The Race to Keep Up with Technology

Today's federal managers are faced with both the promises and pitfalls of the revolution in IT, social media, artificial intelligence, geographic information system (GIS) technology, and "Big Data" mining. In theory, the information age has tremendous potential to improve agency management and to target resource expenditures better through statistical analyses and GIS applications, for more "evidence-based" policymaking and for greater cross-agency collaboration and data sharing (e.g., through "enterprise management" software). As a former chief financial officer and assistant secretary for administration at the US Treasury Department writes:

> With investments in new technology over the past decade such as Enterprise Resource Planning (ERP) solutions, agencies are now capturing the necessary data to understand agency performance. This data, combined with the emergence of advanced, predictive analytic technology and a focus on change management and execution, is enabling agencies to meet these efficiency challenges head on. They are starting to recognize how data-driven efficiencies can achieve targeted savings and better service delivery at a scale large enough to absorb cuts and sustain mission capabilities. (Quehl 2014)

They also make the consequences of managers' actions more transparent to citizens, something to which they are not accustomed. In advancing the "open data movement," for instance, the Obama administration has sought to improve the responsiveness and timeliness of agencies to Freedom of Information Act requests, as well as to release hundreds of thousands of agency data for citizens and interest groups to analyze.

Prior research on e-government, IT, and social media initiatives in public agencies identifies some successes but also suggests that reaping the potentially immense benefits of these technologies has been quite challenging. For instance, the most common use of e-government has been sharing information and allowing service transactions rather than collaboration or civic deliberation. Moreover, most IT applications have focused on monitoring the status quo to make it run better. Also, because the quantitative measures used in IT systems simplify real-world complexity, they can narrow policymakers' focus to policy problems that are quantifiable and for which data are available. Finally, both privacy and cybersecurity issues also arise. Daily attacks by hackers on government agencies and their private sector partners, as well as major security breaches at federal agencies, have occurred. The latter include devastating breaches in 2015 at the Office of Personnel Management where personnel information, including security clearances for 21.5 million employees, was stolen. Breaches also occurred in 2014 at the US Department of State where Russian-backed hackers jumped for 6 months between State Department and White House unclassified email systems. Indeed, national security vulnerabilities are immense. At the Pentagon, seven million digital devices are connected to military data or weaponry, further increasing the vulnerability of its systems to hackers.

In addition, despite the benefits of social media for connecting with citizens, federal agencies have to become more adept in its use. As illustrated during such recent catastrophes as Hurricane Sandy and the Boston Marathon bombings, social media offers public managers a way to connect quickly and directly with citizens. As such, the "future of public-sector communication lies in clouds and ether – Twitter, Facebook, Instagram, Pinterest and their ilk" (Walters

2014). At the same time, the ascendancy of social media has also opened federal agencies to greater scrutiny, along with unfounded rumors and inaccurate information about their operations that spread quickly throughout the blogosphere. As such, it requires constant monitoring and response by federal agencies.

Similar issues arise in the use of GIS technology in the government. On the positive side, GIS is being used for planning and community development, environmental protection, integrated public safety, infrastructure management, transportation planning/modeling, assessments, facility siting, vehicle routing, permitting/licensing, election management, and parcel/real estate management. On the negative side, issues related to democratic governance arise, including the same privacy and social equity issues that federal managers have to struggle with in the IT and social media areas.

Given Moore's law that the information processing capacity of computers doubles every 2 years, dealing with the privacy, income redistribution, social equity, and possible distortion of political power, technology is likely to be a persistent agenda item in federal executive management. However, federal agencies are not keeping pace with the technology revolution and often lag considerably behind. This is happening despite increased funding by the Obama administration, aggressive IT marketing campaigns by consultants and social media companies, and the Obama administration's cybersecurity "sprint" effort in 2015. Stressed in the process has been the need for strategic IT planning, as well as efforts to move federal agencies toward the Cloud and away from outdated and hacker-vulnerable IT "legacy" systems.

Difficulties in keeping pace with the information revolution stem from several sources. Part of the problem has been IT purchasing and contracting snafus such as those at the Internal Revenue Service, the Office of Personnel Management, and the Centers for Medicare and Medicaid Services. But so, too, has Congress contributed to the situation through persistent underfunding of IT and cybersecurity purchases. For instance, according to two reports from the inspector general at the Defense Department, the Obama administration's Cyber Mission Force teams at the Pentagon need a substantial increase in funding to do their job effectively. Moreover, pressure on agencies to move away from IT legacy systems and migrate their data to the Cloud for cost savings and better cybersecurity has often been opposed by federal managers.

## A Future of Competing Pressures for Managerial Change

As the preceding summarizes, formidable pressures have existed on federal executive management reform. They are likely to continue in the foreseeable future. Federal agencies are – and will continue to be – asked to (1) reconceptualize the purpose of their organizations; (2) redefine the hierarchical models that have passed for administrative rationality in most agencies in favor of decentralization of authority and networked governance; (3) reconnect with citizens, many of whom feel estranged from government; (4) reengage scarce resources from lower to higher priorities; (5) recapitalize human resources in a tough political and fiscal environment; and (6) do these things while revitalizing a sense of common purpose informed by ethical, legal, and democratic constitutional values (Durant 2014).

As such, effective federal executive management in the future will depend on leaders (who, because of decentralization, can exist at all levels of agencies) honing six interrelated but analytically distinct sets of skills (see Durant 2014). Aside from those associated with their professional specialties, these skills are (1) analytical, (2) systemic, (3) technological, (4) strategic, (5) institutional, and (6) legal, constitutional, and ethical. Thinking *analytically* means that leaders must have methodological, econometric, performance measurement, and statistical skills. These are imperative to interpret accurately the quality and utility of research, data analytics, and

performance measures in an era where evidence-based decision making and outcome-based management are expected to inform policy and program design, implementation, and evaluation. But analytical skills go far beyond leaders being critical consumers of data-based research; executive leaders must be able to engage skillfully in "evidence, argument, and persuasion" within their agency, with agency stakeholders (e.g., congressional oversight committees and issue network members), and with the public (Majone 1989).

Persistently honing and refining their ability to think *systemically* can give leaders a competitive edge in the policy and administrative marketplace – especially in today's networked state. This means asking themselves, "Who has to do what, in what ways, with what resources (human and financial capital), under what political or economic constraints, and with success measured in what way(s)?" Leaders must also have skills in identifying or participating in opportunities for partnering, negotiating over the terms of a partnership, holding the partnership together (due to a tendency for them to atrophy over time), and keeping partners and subordinates from leaving and focused on goals.

Executive leaders must also have a working knowledge of the opportunities, challenges, and caveats of today's *technological* revolution. They need not be technology experts, unless that is their area of expertise. However, they must be savvy enough to realize the potential of new technology, rather than see it as a threat. Otherwise, federal agencies will miss out on the ability of data mining and data analytics to reveal patterns of needs or administrative shortcomings previously unknown or unspoken of in agencies, to provide greater efficiencies and effectiveness in service delivery, and to garner greater levels of accountability. But more than technical familiarity is needed; leaders must understand the strategic and tactical advantages and caveats of these technologies noted above, as well as the challenges in training subordinates to cope with them and citizens to navigate them easily. Also necessary will be an ability to reconnect with citizens. They will have to do so whether or not they want to in a social media age where citizens' iPhones rather than "old news media" can reveal agency shortcomings (major or minor, intentional or unintentional) to millions in a highly litigious society.

All of which lead to a need for executive leaders who continually refine their ability to think *strategically*. Acting strategically involves an adroit linking of all the other skills discussed, as well as skills in strategic planning and strategic management. It also means having the skills – amid all the political and administrative constraints facing them – to align the activities of their business (e.g., central budgeting and personnel offices), program (e.g., drug enforcement), and technology units (e.g., IT acquisition office) so that they reinforce each other to advance agency goals. Likewise, they must work to ensure that existing incentive structures reinforce these goals. Finally, in adopting new strategic policies or using administrative strategies from the private sector, a strategy of "trust but verify" must always be kept in mind. One-size-fits-all proposals for administrative reform typically work in some administrative situations but not in others (e.g., planning, programming, and budgeting system).

Relatedly, thinking *institutionally* means that, amid the rush of political pressures, change is not good if it undermines the organizational essence or mission of the agency or program. Political pressures for change often imply that the legacy inherited by current employees has no value because "things have changed." Sometimes this is true but other times it is not. When not true, effective leadership means maintaining the institutional integrity of one's organization in the face of threats or explaining to subordinates how change will still protect that integrity. Institutional thinking also means leaders taking what they have inherited from their predecessors, adapting it to new and evolving challenges, and ensuring that the essence of that heritage is not lost (Heclo 2008).

Even if executive leaders hone the preceding skills to perfection, their success can be jeopardized

without a strong sense of their *legal*, *constitutional*, and *ethical* obligations as public servants. They must know what their agencies are – and are not – legally authorized to do. They must have a degree of constitutional literacy as well. Without it, agency employees can be held personally liable for failing to protect constitutional rights that they should have known about (e.g., substantive and due process rights). However, leaders must do more than this. They must leaven their activities with a sense of ethics. Ethics does not mean merely following the rules; one can follow all organizational rules and still do harm. Such an instrumental mindset says, in effect, "As long as I didn't do anything wrong, I must have done right" (Gawthrop 1998, p. 153). It also reduces federal executive management to an immediate objective and its means. Lost is the ennobling purpose those means serve in helping to ensure a democratic republic. No less is expected of federal executive managers.

# Federal Government, Russia

Ivan Leksin
Lomonosov Moscow State University, School of Public Administration, Moscow, Russian Federation

## Synonyms

Federal governing bodies; General government

## Definition

The word "government" actually does not have a single appropriate equivalent in Russian. Depending on the context, this term should be translated into Russian in different ways.

In the sense of a pattern of governing, a single word will be inappropriate in Russian: to speak about the "government," a conventional construction "form of ruling," or "organization of state authority," should be used.

The most widely used Russian analogue of the "government" is the word "pravitel'stvo," meaning the governing entity (Khabrieva 2005). However, three different notions can refer to such entity: a certain body vested with executive powers, the executive as a system of bodies, and the whole system of governmental bodies (legislative, executive, and judiciary ones).

Currently, in Russian official language, the said term refers to certain collegial executive bodies (e.g., the "Government of the Russian Federation," former federal "Council of Ministers"). In order to designate the executive as a whole or a level of government (i.e., a group of governmental bodies, considered collectively), a collocation is used that sounds quite strangely in English if translated directly. For instance, the federal executive system is cumbersomely named the "federal bodies of executive power."

Reasoning from the mentioned issues, the term "federal government of Russia" shall be used hereinafter for the whole national system of governing bodies, including the legislative, the executive, and the judiciary. The collocation "Government of the Russian Federation" shall in its turn be used to designate the collegial executive body specified in the Constitution of the Russian Federation. Thus, the Government of the Russian Federation is officially just a single body from among some 70 bodies that refer to the federal executive and from among about 2,800 federal bodies (auxiliary bodies not included) that the Russian federal government comprises. These are the President of the Russian Federation (see ▶ Head of the State and Public Administration, Russia), the Federal Assembly (the parliament of the Russian Federation), the said some 70 executive bodies, and over 2,700 federal courts.

## Introduction: Separation of Powers at the Federal Level of Government

The idea of separation of powers had been implemented quite specifically in the Russian Federation (Shevtsov 2004). Russia constitutionally recognizes the separation of powers among the principles of governance on both federal and regional levels since 1992. However, this principle had never been implemented explicitly. Before the Constitution of 1993 came into force, the Russian Federation by construction of the federal government possessed some features of a parliamentary republic and later (since the establishment of the office of directly elected President of the Russian Federation in 1991) of a parliamentary-presidential republic. The then-current federal parliament, the Supreme Soviet (Supreme Council) of the Russian Federation, since the constitutional amendment of 27 October 1989 came into force, had been elected indirectly. Its formation had been entrusted to the popularly elected Congress of People's Deputies of the Russian Federation.

Besides formation of the Supreme Council and electing of its presiding officials, this superorgan, consisting of over 1,000 deputies, had the powers to elect the Constitutional Court of the Russian Federation; to approve the nominees for the Procurator-General (Attorney General, or

Prosecutor General) of the Russian Federation, the Chairman of the Supreme Court of the Russian Federation, and the Chairman of the Higher Arbitration Court of the Russian Federation; to dismiss the President of the Russian Federation; to adopt a Constitution of the Russian Federation and to amend it; to determine internal and foreign policies of the Russian Federation; and to abrogate decisions enacted by the Supreme Council and by the President of the Russian Federation.

Obviously, such concentration of powers in a single body did not accord with the principle of their separation. Actually, Russia of the early 1990s was a "superparliamentary" republic, given the facts that the Congress of People's Deputies of the Russian Federation was a parliamentary-style body, and the Supreme Council of the Russian Federation was "the organ of the Congress of People's Deputies" according to Art. 107 of the Constitution (Basic Law) of the Russian Federation.

The current Constitution of the Russian Federation enacted in 1993 proclaims the principle of separation of powers as well. Its Art. 10 reads that "state power in the Russian Federation shall be exercised on the basis of its division into legislative, executive and judicial." Under this Constitution the system of separation of powers looks more balanced. However, in fact it provides for significant concentration of powers, this time, the superorgan is the head of the Russian state that possesses enough powers to exercise considerable influence upon all branches of the general government, as well as on the regional governments (see ► Head of the State and Public Administration, Russia).

## Federal Parliament

Since 1993 the federal parliament is constitutionally named the Federal Assembly. It is a bicameral institution comprised of the Council of the Federation, the upper chamber, and the State Duma, the lower chamber. It is a successor of the Supreme Soviet (Supreme Council) of the Russian Federation, either bicameral since 1991.

Art. 94 of the Constitution of the Russian Federation calls the Federal Assembly the representative and legislative body of the Russian Federation. However, actually the Federal Assembly has no significant features that would allow calling it a full-fledged governmental body. As contrasted to the Supreme Council of the Russian Federation, the chambers of the Federal Assembly have neither common officials nor powers. The Federal Assembly does not hold common sessions or joint sittings (except for hearing the messages of the President of the Russian Federation, messages of the Constitutional Court of the Russian Federation, and speeches of the leaders of foreign states) and cannot issue decisions. Technically, the term "Federal Assembly" serves to designate two separate governmental bodies, the State Duma and the Council of the Federation.

In the strict sense, the Federal Assembly is not even a legislative body. As mentioned, it is not empowered to issue any legal acts. Federal laws, federal constitutional laws, and laws on amendments to the Constitution of the Russian Federation are not acts of the Federal Assembly. They are attributed to the Russian Federation as a whole, while the Federal Assembly is not entitled to represent the Federation. Thus, it would be reasonable to say that currently in the Russian law the word "legislative" stands for the institution that takes part in federal legislation but does not encompass the whole legislative process. At the same time, the law does not institutionalize the body responsible for complete legislative cycle. Actually, the federal law-maker in Russia is a composite institution consisting of, normally, three bodies, i.e., the State Duma, the Council of the Federation, and the President of the Russian Federation. For the cases of constitutional amendments, the legislatures of the constituent units of the Russian Federation can be regarded as parts of the federal parliament as well.

Surprisingly, legislative identity of the Council of the Federation and the State Duma as separate bodies is doubtful as well. The Constitution of the Russian Federation lists main powers of each chamber of the Federal Assembly. According to Art. 102 of the Constitution, jurisdiction of the

Council of the Federation includes approval of changes in borders between constituent entities of the Russian Federation, approval of presidential decrees on the introduction of martial law and of a state of emergency, deciding on the possibility of using the Armed Forces of the Russian Federation abroad, calling an election of the President of the Russian Federation, impeachment of the President of the Russian Federation, appointment of judges of the Constitutional Court and of the Supreme Court of the Russian Federation, appointment and dismissal of the Procurator-General of the Russian Federation and his deputies, and appointment and dismissal of Deputy Chairman and half of the auditors of the Accounts Chamber. On the issues referred to its jurisdiction, the Council of the Federation adopts resolutions.

Jurisdiction of the State Duma includes granting an assent to the appointment of the Chairman of the Government of the Russian Federation by the President of the Russian Federation, vote of confidence in the Government of the Russian Federation, hearing of annual reports of the Government of the Russian Federation, appointment and dismissal of the Chairman of the Central Bank of the Russian Federation, appointment and dismissal of the Chairman and half of the auditors of the Accounts Chamber of the Russian Federation, appointment and dismissal of the Commissioner for human rights, proclamation of amnesty, and bringing an accusation against the President of the Russian Federation for his impeachment (Art. 102 of the Constitution). On the issues within its jurisdiction, the State Duma issues resolutions as well.

Thus, by the nature of their jurisdiction, each chamber of the Federal Assembly, as well as the latter taken as a whole, turns out to be rather an administrative than a legislative body.

Constitutional provisions regarding procedures of formation of both chambers of the Federal Assembly are very fragmentary. Surprisingly, the Constitution of the Russian Federation tells much more about procedures of formation of the federal executive rather than about the ones relating to the federal parliament.

The Constitution of the Russian Federation reads that the State Duma consists of 450 popularly elected deputies (citizens aged 21 are considered to be eligible). The Council of the Federation according to the Constitution of the Russian Federation of 1993 is a chamber of the regions. Constituent entities of the Russian Federation enjoy equal representation in it. Each region delegates two representatives (one coming from the legislature and the other from the executive). Besides, according to the constitutional amendment of 2014, the President of the Russian Federation can appoint up to 17 "representatives of the Russian Federation" as additional members of the Council of the Federation (none appointed heretofore).

However, the Constitution does not indicate neither the voting system that should be used at the parliamentary elections nor the way the Council of the Federation should be formed. Consequently, these matters of apparently constitutional significance are decided upon by the federal legislator. As a result, legal provisions regarding formation of both chambers of the federal parliament in Russia are much less stable in Russia that in most federal or regional states.

Since 1993, the electoral system at federal parliamentary elections had undergone a long series of reforms. The first deputies of the State Duma according to transitional provisions of the Constitution and to the regulations approved by the Presidential Decree No. 1400 dd. 21 September 1993, on the constitutional reform, were elected for a term of 2 years. Since 1995 elections for a 4-year term had been held four times consecutively. Finally, the constitutional amendment of 2008 increased the deputies' term to 5 years (this provision was applied for the first time at the 2011 elections). The voting system had been subjected to changes as well. Until 2007 half of 450 deputies had been being elected in majority voted circuits, and the rest by proportional voting. The Federal Law No. 51-FZ dd. 18 May 2005, "On Elections of the Deputies of the State Duma of the Federal Assembly of the Russian Federation," established pure proportional representation (this system had been applied at the elections of 2007 and 2011). Since 2016, a mixed electoral system is being used again under the Federal Law No. 20-FZ dd. 22 February 2014, "On Elections of the

Deputies of the State Duma of the Federal Assembly of the Russian Federation."

The formation procedure for the Council of the Federation had been specified the Constitution of the Russian Federation only in respect of its first convocation. The concluding and transitional provisions of the Constitution of 1993 stipulated that members of the Council of the Federation of the first convocation should be elected by popular vote and should serve the term of 2 years. The Constitution did not even indicate if the subsequent convocations should be elected or appointed. According to the Art. 96 of the Constitution, the rules for forming the Council of the Federation in respect of subsequent convocations should be introduced by the Federal Law. These rules passed through numerous reforms. As of 2016, the third Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation" is in effect.

The first Federal Law with this title (No. 192-FZ dd. 5 December 1995) occupied a single page of text. It did not even provide for residential qualification and age requirements for the members of this chamber of the federal Parliament. This laconic act stipulated that every constituent unit would be represented by its chief executive and by the chairman of the regional legislature. A representative of the two-chambered regional legislature was to be decided upon by the chambers themselves.

The second Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation" (No. 113-FZ dd. 5 August 2000) established new provisions that ended direct involvement of regional politicians into the federal policy.

According to the said Law, a representative of the regional legislature should had been elected to the Council of the Federation by this legislature upon the proposal of its chairman (the term of office being equal to the term that he was popularly elected for). A representative of the regional executive should had been appointed by the higher official of the constituent entity of the Russian Federation for the term of office thereof (this appointment could be vetoed by a two-thirds majority of the deputies of the regional legislature). Both the legislature and the higher official of the region had the right to recall their representatives in the Council of the Federation under the amending Law No. 109-FZ dd. 4 August 2001, to the Federal Law No. 3-FZ dd. 8 May 1994, "On the Status of a Member of the Council of the Federation and on the Status of a Deputy of the State Duma of the Federal Assembly of the Russian Federation."

Besides deprivation of parliamentary immunity and decrease of regional influence on federal decision-making, removal of higher officials of constituent entities of the Russian Federation from the Council of the Federation had quite a practical substantiation. Holding of both a federal and a regional office affected execution of the incumbent duties adversely. The senators had to be on the move between these offices, thus having no time to consider neither the federal nor the regional affairs.

The said Law set some requirements for entering upon office of a member of the Council of the Federation that remain unchanged till the present moment. This office could be occupied by a citizen of the Russian Federation, who has neither citizenship of a foreign state nor the right to permanently reside in a foreign state. A candidate had to be at least 30 years old.

The next significant change in the composition of the Council of the Federation occurred without amending the legislation devoted to its formation procedure directly. The new rules for getting into office of the higher official of the constituent entity of the Russian Federation, established by the Federal Law No. 159-FZ dd. 11 December 2004 (see ► Regional Executives, Russia), together with the Federal Laws "On Political Parties" and "On the Basic Guarantees of the Russian Citizens' Electoral Rights and the Right to Participate in Referenda," predetermined the future convocations of the Council of the Federation to a great extent (and thus affected its decisions and its political role in general).

The said Law was followed by the amendment No. 160-FZ dd. 16 December 2004, to the Federal Law "On the Status of a Member of the Council of the Federation and on the Status of a Deputy of the

State Duma of the Federal Assembly of the Russian Federation." This amendment further ruined the senators' attachment to the regions they were supposed to represent. It stipulated that the recall of a member of Council of the Federation could occur upon the proposal of its Chairman (the "speaker") only. The regional legislatures therefore lost control even over their own delegates.

The amending Law No. 189-FZ dd. 21 July 2007 was destined to enhance the said attachment, which had become almost unnoticeable by that time. It required that the member of the Council of the Federation must had resided in the region he was representing, for at least 10 years in the aggregate. This provision did not extend over then-current senators and, besides, over military and law-enforcement service nominees. Nevertheless, this provision was abrogated since 1 January 2011 by the Federal Law No. 21-FZ dd. 14 February 2009.

The said Law amended both the Federal Law "On the Status of a Member of the Council of the Federation and the Status of a Deputy of the State Duma of the Federal Assembly of the Russian Federation" and the Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation." This amendment stipulated two ambiguous rearrangements.

Firstly, it restored the provision for the recall of a member of Council of the Federation by the regional legislature and by the higher official to its original version, having removed the Chairman of the chamber from the procedure of deciding upon this matter. Simultaneously the said amendment deprived regional legislatures of the right to veto the appointments made by the chief executive of the constituent entity of the Russian Federation.

Secondly, having repealed the said residential requirement, it narrowed the circle of prospective nominees for election by the regional legislature or for appointment by the chief executive of the constituent entity of the Russian Federation in some other way. According to the said Law, such nominees should have been chosen either among deputies of the electing legislature or among deputies of the councils of municipalities located within the same constituent entity. On 5 October 2011, these categories of deputies were extended. According to the amending Law No. 264-FZ to the Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation," a deputy of the State Duma of the Federal Assembly could also be nominated for election or appointment for the office of a senator.

Despite the mentioned attempts to maintain responsibility of the members of Council of the Federation to their constituent entities, it is quite natural that the Council of the Federation tended to lose its political independence and significance. As a result of this, some experts even suggested to abolish the Council of the Federation, thus reverting Russia to one-chambered parliament. However, restitution of regional chief executives' elections in 2012 abruptly ended these speculations (see ▶ Regional Executives, Russia).

The third Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation" (No. 229-FZ dd. 3 December 2012) had fixed a compromise ensuring a slight enhancement of political role of the Council of the Federation.

Since said Law came into force in 2013, the regional legislatures elect their delegates to the Council of the Federation. The candidates can be nominated by the chairman of the regional legislature, by any faction, and by a group of deputies numbering not less than one-fifth of their total number. These candidates should be members of the legislature of the constituent entity that they intend to represent in the Council of the Federation. This rule does not apply to the members of the Council of the Federation, delegated by the regional executive. These are appointed by higher officials of constituent entities of the Russian Federation, as earlier. However, the names of the candidates for such appointment should be fixed at the election of the higher official of every constituent entity. Every candidate for the office of the regional chief executive should nominate three candidates for the office of the member of the Council of the Federation. Therefore, the voters indirectly approve these potential nominees.

Every eligible person has a right to become a nominee of a single candidate only. Besides meeting the requirements mentioned above, all candidates should have stainless reputation and be residents in the regions they are about to represent, for not less than 5 years. This provision had been modified by the amending Federal Law No. 196-FZ dd. 28 June 2014. The latter stipulated that in order to be eligible a nominee should be a resident in his region for either 5 consequent years directly preceding his election or appointment or 20 years altogether. This requirement, obviously, should not be applied to the members of the Council of the Federation that can be appointed by the federal President as the "representatives of the Russian Federation." However, no provisions regarding such members have yet appeared in the Federal Law "On the Procedure for the Formation of the Council of the Federation of the Federal Assembly of the Russian Federation."

## Federal Executive

According to Art. 110, para. 1 of the Constitution of the Russian Federation, executive power shall be exercised by the Government of the Russian Federation. Under Constitution, it consists of the Chairman, Deputy Chairmen, and federal ministers. The presiding member of the Government, the Chairman (unofficially, the Prime-Minister), shall be appointed by the President of the Russian Federation with the consent of the State Duma of the Federal Assembly. After being appointed, the Chairman proposes the nominees for the offices of his deputies and of the federal ministers. All these officials are being appointed and dismissed by the President of the Russian Federation.

Apart from the Government of the Russian Federation, executive bodies of three types currently exist at the federal level. According to the Decree of the President of the Russian Federation No. 314 dd. 9 March 2004, "On the System and Structure of the Federal Executive Bodies," these are federal ministries, federal services, and federal agencies. The first are designed primarily to elaborate public policies and to perform normative regulation within a specific sector. Most federal services operate as controlling and supervisory bodies, while some perform functions referring to national security and defense. Finally, federal agencies provide public services and administer federal estates.

The bodies of all three types can be formed under either Government of the Russian Federation or the President of the Russian Federation. Most federal services and federal agencies are hierarchically dependent on the ministries, though some are subordinate directly to the Government or to the President. Currently over 50 federal ministries, services, and agencies are under jurisdiction of the Government, while the President of the Russian Federation supervises 20 of such bodies. However, the latter include such key institutions, as the Ministry of Internal Affairs, the Ministry of Foreign Affairs, the Ministry of Justice, the Ministry of Defense, the Ministry of Emergencies, the Federal Security Service, the Federal Guarding Service, and the Military Intelligence Service. This makes the President of the Russian Federation the actual leader of federal executive, especially taken together with two other facts:

- The constitutional procedure of the Government formation makes this body a presidential creature, on the whole.
- Numerical composition of the Government of the Russian Federation (including number of Deputy Chairmen of the Government) is decided upon by the President, and the whole system of federal ministries, services, and agencies is set by the Head of the state as well (see ▶ Head of the State and Public Administration, Russia).

Thus, in fact, the Government of the Russian Federation is neither the only possessor of federal executive powers nor the chief executive body of the Federation. More accurately, it should be named the institution that takes decisions on majority of administrative issues within the federal jurisdiction, but not on the most vital for the state (these are the prerogative of the President). According to the Constitution of the Russian Federation, the Government of the Russian Federation shall:

- Draw up a federal budget, submit it to the State Duma, ensure its execution, and submit to the State Duma a report on it
- Submit to the State Duma annual record of its performance
- Ensure implementation of a unified financial, credit and monetary, cultural, science, educational, health, social, and environmental policy in Russia
- Administer federal estate
- Carry out measures to ensure defensive capacity, state security, rule of law, human rights and freedoms, protection of property and public order, crime control, and implementation of foreign policy of the Russian Federation

Besides, the Government of the Russian Federation is the smallest of the federal executive bodies. As of 2016, it consists of 31 members, while the central apparatuses of a number of specialized executive bodies exceed 1,000 public servants. Moreover, most of such bodies have regional and even subregional departments where dozens of thousands of federal employees may serve (e.g., the number of such employees serving in territorial-based subdivisions of the single Federal Tax Service exceeds 100,000).

## Federal Judiciary

The federal judiciary comprises three branches:

- Regular courts that hear typical civil, criminal, administrative, and other cases
- Courts of arbitration that resolve economic disputes and some other cases
- The single Constitutional Court of the Russian Federation that hears cases on verification of constitutionality of federal and regional laws, by-laws, etc., resolves disputes on jurisdiction between governmental bodies, and gives its interpretation of the Constitution of the Russian Federation

The subsystem of regular federal courts includes two basic tiers:

- District courts (about 2,500 throughout Russia) that hear the cases as courts of the first instance and the appeals against decisions of the justices of the peace (that are considered to be regional justices)
- Eighty five courts in the regional capitals (including the ones titled "supreme courts" of the republics)

Besides, about 150 military courts exist that discharge functions of regular courts over the military servants.

The subsystem of the arbitration courts includes three tiers:

- Over 80 region-level courts
- Twenty-one appellate courts
- Ten cassation courts

Besides, specialized federal courts are provided for by the federal legislation. Up to date, one federal court of this kind had been created. This is the Intellectual Rights Court established in December 2011 that refers to the subsystem of arbitration courts.

Both subsystems (of regular federal courts and arbitration courts) are headed by the Supreme Court of the Russian Federation that serves as the higher instance for the cases of most categories, supervises activity of the lower courts, and provides explanations on the issues of court proceedings. Until the reform of 2014, the body under this title helmed the regular courts only, while for the arbitration courts a separate Higher Arbitration Court of the Russian Federation operated as the upper instance.

All the mentioned regular federal courts and arbitration courts are staffed by federal judges totaling 30,000. Under the Constitution of the Russian Federation, all these officials are being appointed by the President of the Russian Federation. The judges of the Supreme Court (totaling 170) and of the Constitutional Court of the Russian Federation (totaling 19) are being appointed by the Council of the Federation upon suggestions by the President of the Russian Federation. Thus, the President of the Russian

Federation possesses considerable levers of influence upon the judiciary as well (Avakyan 2014).

## Conclusions

The main features of the Russian government at the federal level can be reduced to the following ones. First, the federal government of Russia, though constitutionally divided into branches, due to legislative, political, and administrative means operates as a consolidated apparatus in the recent years.

Second, the crucial role within this apparatus is being played by the President of the Russian Federation and by his Administration (see ▶ Head of the State and Public Administration, Russia).

Third, the phenomenon called federal government is by no means restricted to the central governmental apparatus. In reality, the federal government is dispersed throughout the country and encompasses dozens and even hundreds of governmental offices in every constituent entity of the Russian Federation (see ▶ Constitutional Federalism and Public Administration, Russia; ▶ Multilevel Governance and Public Administration, Russia).

# Federal Grand Jury System and Social Policy

Randy L. T. Jacobs
Department of Public Policy and Administration, Jackson State University, Jackson, MS, USA

## Definition

Bill of Rights: the first ten amendments to the constitution. The Bill of Rights lists specific prohibition on governmental power.
Federal grand jury: a jury of 16–23 jurors, in each federal court district, which serves for a term of a year and is usually selected from a list of nominees offered by the judges in a district.
Stamp Act: an act regulating stamp duty (a tax on the legal recognition of documents).

## Introduction

The grand jury is an institution that has long played a vital role in criminal justice systems, specifically as it relates to the indictment and prosecution of alleged criminals. The grand jury originated in 1166, with the enactment of the Assize Clarendon, by King Henry II of Britain (McSweeney 2014). The Assize Clarendon mandated that a "jury of twelve good and lawful men" be periodically convened, to investigate and inform the king's justices, whether they had knowledge of or suspected community members of having committed a crime (Segal et al. 1961). Previous to the enactment of the Assize Clarendon, the Catholic Church and nobility decided criminal cases by means of "trial by ordeal or trial by battle or trial by compurgation" (Hurnard 1941). Subsequent to the enactment of the Assize Clarendon, English law adopted an evidentiary model, in which evidence, assessment, and investigation were made by laymen, knights, or ordinary freemen, under oath (Hurnard 1941). Therefore, the Assize Clarendon had a significant impact on trial methods, which would eventually evolve

into a concept known as trial by jury. Trial by jury was officially codified in the Magna Carta and recognized by King John in 1215 (Hurnard 1941).

The institution of the grand jury and the concept of trial by jury were imported to America by British emigrants. However, the grand jury was gradually integrated into colonial society. The first conventional grand jury was not established until 1635 (Kadish 1996). The grand jury officially became codified in American law in 1791, with the adoption of the Fifth Amendment of the United States Constitution (Kadish 1996). While the federal government and all states in the United States currently have provisions for grand juries, only half of the states actually employ them and 22 require their use, to varying extents (Brenner and Shaw 2003).

Constitutional amendments are applicable to the states via the incorporation doctrine of the due process clause of the Fourteenth Amendment. However, the grand jury clause of the Fifth Amendment of the United States Constitution has not been incorporated against state government. Therefore, according to state law, the following states employ some form of grand jury: Alaska, Arizona, Arkansas, California, Colorado, Delaware, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Mississippi, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wyoming, and the District of Columbia (Brenner and Shaw 2003).

This article will explore the development and function of the federal grand jury as an institution, designed to protect citizens against malicious prosecution. This article will explore the primary criticism of the grand jury, namely, that the federal grand jury has abandoned this original duty of protection and, therefore, should be abolished.

## Federal Grand Jury as a Social Policy

### Grand Jury Clause

The Fifth Amendment of the United States Constitution, which includes the grand jury clause, was adopted as part of the Bill of Rights in 1791 (U.S. Const. Amend. V.8). The pertinent part of the Fifth Amendment provides "No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or the militia, when in actual service in time of war or public danger" (U.S. Cont. Amend. V.8). Thus, the American grand jury originated not as an agent of the government, but as a defense against the government.

### Federal Rule of Criminal Procedure 6

Rule 6 provides that the federal grand jury must consist of 16–23 members and that 12 members must concur in order for an indictment to be issued. The federal grand jury is instructed to return an indictment (true bill) if probable cause standard has been met or no true bill if probable cause standards have not been met (Fed. R. Crim. P. 6).

Thus, based on the provisions of the Fifth Amendment and Federal Rule of Criminal Procedure 6, the federal grand jury established a shield, between accusations and convictions. The federal grand jury, theoretically, protects US citizens against an arbitrary and overzealous government, by protecting US citizens "against hasty, malicious, and oppressive prosecution" (*Wood v. Georgia*, 370 U.S. 375, 390 1962).

### Secret Federal Grand Jury Proceedings

Grand jury proceedings are held in secret, and all documents and communications concerning the grand jury proceedings are sealed. In addition, no judge is in attendance during the grand jury proceeding. The grand jury proceedings are controlled by a prosecutor, and the defendant has no right to testify before the grand jury or present his case or (in many instances) to even be informed of the grand jury proceedings. While court reporters are allowed to transcribe the grand jury proceedings, the transcriptions are normally sealed. The

purpose of holding grand jury proceedings in secret is to protect the grand jury witness as well as the accused. However, over the years, many defendants have challenged the secrecy of the grand jury proceedings as fundamentally unfair. The argument for such secrecy was unanimously upheld by the US Supreme Court, in *Douglas Oil Co. of Cal. v. Petrol Stops Northwest*, 441 US 211 (1979). The court stated:

> If pre-indictment proceedings were made public, may prospective witnesses would be hesitant to come forward voluntarily; witnesses who appeared before the grand jury would be less likely to testify full and frankly; and there also would be the risk that those about to be indicted would flee, or would try to influence individual grand jurors. Further persons who are accused but exonerated by the grand jury should not be held up to public ridicule.

Although all aspects of the grand jury proceedings are completely secret and/or sealed, there are three exemptions to this general rule, as discussed below:

1. The right to free speech, as protected by the First Amendment of the United States Constitution, commonly allows grand jury witnesses to publically talk about their grand jury testimony. However, in *Denis v. United States*, 384 US 855 (1966), the court held that such public discussion warrants the discovery of grand jury testimony transcripts.
2. In *United States v. Procter & Gamble Co*. 356 US 677 (1958), the court granted the discovery of grand jury transcripts under particular circumstances. The court provided that the party defendant requesting grand jury transcripts is obligated to prove to the court's satisfaction, that without the transcripts a defense would be greatly prejudiced, or that without reference to the grand jury transcripts, an justice would be done. Also, the defendant's request for grand jury transcripts must be made with particularity.
3. The Jencks Act, 18 U.S.C. § 3500, provides that the prosecutor (government) must make available to the defense a verbatim statement or report made by a governmental grand jury witness and/or the defendant but only after the witness and/or defendant has testified on direct examination at trial in the lower district court.

### Investigatory Role

The investigator role of the grand jury primarily concerns the subpoena power of the grand jury (Robin 2010). The subpoena power of the grand jury is the grand jury's authority to force a witness to testify. However, as stated above, the target of a grand jury investigation has no right to testify before the grand jury or put on a defense before the grand jury. However, the United States Attorney's Manual does anticipate the possibility of allowing investigatory targets to testify before the grand jury. The United States Attorney's Manual states that prosecutors:

> must recognize that the grand jury is an independent body, whose functions include not only the investigation of crime and the initiation of criminal prosecution but also the protection of the citizenry from unfounded criminal charges and that targets of investigations have the right to, and can, request or demand the opportunity to tell the grand jury their side of the story (9–11.010 U.S. Attorneys Manual).

### Special Grand Jury

While a conventional grand jury predominantly determine whether or not to bring criminal charges, a special grand jury is convened to investigate whether or not organized crime is occurring in the community in which the special grand jury sits (18 U.S.C. § 331(a)).

## History and Evolution

The grand jury originated in 1166, when King Henry II of England promulgated the Assize of Clarendon (McSweeney 2014). The Assize of Clarendon instructed that 12 "good and lawful" men of the community should be periodically convened, under oath, to act as investigatory agents of the monarch (McSweeney 2014). These investigatory agents came to be known as jurors. Previous to the enactment of the Assize Clarendon, the Catholic Church and nobility decided criminal cases via "trial by ordeal or

trial by battle or trial by compurgation" (Hurnard 1941). Subsequent to the enactment of the Assize Clarendon, English law adopted an evidentiary model, in which evidence, assessment, and investigation were made by jurors under oath (Hurnard 1941). However, the grand jury of 1166 was primarily concerned with expanding the power of the monarch not protecting citizens. Initially, the defendant was both accused and tried by the grand jury (Hurnard 1941). However, in due course, the trial jury (petit jury) increasingly became distinct from the grand jury, until eventually the grand jury and trial juries were completely discernible. In the fourteenth century, the grand jury initiated private testimony in all grand jury proceedings; this was the progenitor to the more draconian secrecy requirements of modern grand jury proceedings (Hafetz and Pellettieri 1999). Distinguishing the grand jury from the trial jury as well as receiving witness testimony in secret provides evidence for the argument that the key function of the grand jury is citizen protection.

The institution of the grand jury and the concept of trial by jury were imported to America by British emigrants. However, the grand jury was gradually integrated into colonial society. The first conventional grand jury was not established until 1635 (Kadish 1996). Throughout the eighteenth century, the British colonist became more resistance to the authority the monarchy. During this period of resistance, the grand jury increasingly became an instrument of political protection. For example, in Boston, the grand jury declined to indict protestors against the Stamp Act, while simultaneously indicting British soldiers for criminal transgressions against the colonist (Kadish 1996). Thus, the legal philosophy, which was developed in England, that the grand jury is the protector of the citizens against malicious prosecution was bolstered during the Revolutionary Period. Without much resistance, the institution of the grand jury officially became codified in American jurisprudence in 1791, with the adoption of the Fifth Amendment of the United States Constitution, which includes the grand jury clause (Kadish 1996).

While the federal government and all states currently have provisions for grand juries, only half of the states actually employ them and 22 require their use, to varying extents (Brenner and Shaw 2003).

## Criticism: A Case for Abolishing the Grand Jury

Although the institution of the grand jury has existed in the United States since 1635 and was officially made a requirement in federal criminal proceedings in 1791, it has received substantial criticism (Kadish 1996). Critics primarily charge that the original function or purpose of the grand jury, which was to protect citizens for malicious prosecution, has become compromised and, therefore, the grand jury should be abolished. Even defenders of the grand jury acknowledge that there are considerable problems with the grand jury but contend that these problems can be remedied.

Critics contend that the modern grand jury has failed to meet its three primary functions, which are (1) to review evidence of alleged criminal conduct and to grant an indictment if the requirements of probable cause are met, (2) to assist the government (prosecutor) in discovering evidence via the grand jury subpoena power, and (3) to protect the citizens from malicious prosecution (Hafetz and Pellettieri 1999). These primary criticisms and others will be discussed below in greater detail.

### Rubber Stamp

In determining whether or not to indict a US citizen, the grand jury is theoretically "a shield against hasty, malicious, and oppressive prosecution" (*Wood v. Georgia*, 370 U.S. 375, 390 1962). Critics charge that the grand jury has abandoned this duty to protect and typically rubber stamp the prosecution's presentation of evidence, without sufficient procedural safeguards, indicting any citizen the prosecutor brings before it (Hafetz and Pellettieri 1999). The grand jury only hears the prosecutor's presentation of evidence and is habitually persuaded by prosecutor's presentation. William J. Campbell, an erstwhile federal district judge, stated that "the grand jury is the total captive of the prosecutor who, if he is candid, will concede that he can indict anybody, at any

time, for almost anything, before any grand jury" (Campbell 1973). Therefore, grand juries provide diminutive protection to the citizens they were established to protect and are considerably more helpful to government (prosecutors).

### Limited Constitutional Rights

Citizens who are subject to grand jury investigations and/or proceedings may not invoke their Sixth Amendment constitutional right to counsel in the grand jury room nor may they invoke their Sixth Amendment right to confront and cross-examine witnesses (*United States v. Williams*, 504 U.S. 36 (1992), *United States v. Mandujano*, 425 U.S. 564, 581, 96 S. Ct. 1768, 1779, 48 L. Ed. 2d 212 1976). Additionally, the Fourth Amendment's exclusionary rule, which excludes illegally obtained evidence, does not apply in grand jury proceedings or investigations. In 1974, the Supreme Court ruled in *United States v. Calandra* that "the exclusionary rule in search-and-seizure cases does not apply to grand jury proceedings because the principal objective of the rule is to deter future unlawful police conduct. . .it is unrealistic to assume that application of the rule to grand jury proceedings would significantly further that goal" (*United States v. Calandra*, 414 U.S. 338, 343 1974). Limiting constitutional rights in grand jury investigations and proceeding leads to the erosion of the duty of the grand jury to protect citizens from malicious prosecution, which further justifies the abolition of the grand jury.

### Subpoena Power

The grand jury has such expansive subpoena power that is capable of investigating alleged crimes even without the presence of a prosecutor. The grand jury subpoena power is used to assist the prosecutor in the prosecution of alleged criminals. Evidence discovered as a result of the grand jury investigation may be used by the prosecutor in a subsequent trial. Citizens subject to grand jury proceedings and investigations can be charged with contempt of court, if they refuse to appear before the grand jury, which is punishable by incarceration for the remaining term of the grand jury (*United States v. Calandra*, 414 U.S. 338, 343 1974). Therefore, the subpoena power is more beneficial to the prosecutor than the citizens.

## Conclusion

The grand jury originated in 1166, with the enactment of the Assize Clarendon, by King Henry II of Britain (McSweeney 2014). The Assize Clarendon mandated that a "jury of twelve good and lawful men" be periodically convened, to investigate and inform the king's justices, whether they had knowledge of or suspected community members of having committed a crime (Segal et al. 1961). The grand jury of 1166 did not protect the rights of the subjects of the king but expanded the power of the monarch, as the grand jury served as the investigatory agents of the king (government). Subsequent to the enactment of the Assize Clarendon, English law adopted an evidentiary model, in which evidence, assessment, and investigation were made by laymen, knights, or ordinary freemen, under oath (Hurnard 1941). Therefore, the Assize Clarendon had a significant impact on trial methods, which would eventually evolve into a concept known as trial by jury. Trial by jury was officially codified in the Magna Carta and recognized by King John in 1215 (Hurnard 1941).

The institution of the grand jury and the concept of trial by jury were imported to American by British emigrants. However, the grand jury was gradually integrated into colonial society. However, throughout the eighteenth century, the British colonist became more resistance to the authority the monarchy. During this period of resistance, the grand jury increasingly became an instrument of political protection. Thus, the legal philosophy that the grand jury is the protector of the citizens against malicious prosecution was bolstered during the Revolutionary Period. Without much resistance, the grand jury officially became codified in American jurisprudence in 1791, with the adoption of the Fifth Amendment of the United States Constitution, which included the grand jury clause (Kadish 1996). The American grand jury originated not as an agent of the

government, but as a defense against the government.

Although the grand jury has existed in the United States since 1635 and officially made a requirement in federal criminal proceedings in 1791, it has received considerable criticism (Kadish 1996). Critics primarily charge that the modern grand jury has failed to meet its original functions: (1) to review evidence of alleged criminal conduct and to grant an indictment if the requirements of probable cause are met, (2) to assist the government (prosecutor) to discover evidence via the grand jury subpoena power, and (3) to protect the citizens from malicious prosecution (Hafetz and Pellettieri 1999). Therefore, based on these criticisms, the institution of the grand jury should be abolished.

## Synonyms

Political appointees; Senior civil service; Senior executive management

## Definition

Federal senior government management comprises the set of positions directly associated with strategic decision-making in public sector organizations.

## Introduction

The study of senior management is essential because this set of leaders is the most direct interface between bureaucrats and the political actors, which requires competencies that are different from other organizational levels of government bureaucracy (Longo 2003; Lewis 2008). The high-level bureaucracy is responsible for implementing the major political decisions, offering alternatives that align technical and political aspects (Pacheco 2010; Palotti and Cavalcante 2018).

In this sense, in addition to technical knowledge, senior government management needs to have social and political articulation skills (Gaetani 2002). At the same time, different

designs for recruiting and training this high bureaucracy affects how the public sector works – whether from the point of view of the organization of the public machinery, the dialogue with political actors, and the implementation of government programs (Fernandes 2013; Pereira 1996; Praça et al. 2011).

There are three types of commissioned positions in the Brazilian federal government: those of Senior Management and Advisory (DAS), the Commissioned Functions of the Executive Branch (FCPE), and the Positions of Special Nature (NES). DAS is free to be nominated and dismissed, although there are criteria in place that limit appointments' discretion. FCPE is exclusive to federal civil servants, being used more frequently since 2016. NES is used to appoint political agents, such as ministers of state.

## Senior Management in the Brazilian Federal Administration: Theoretical Aspects

In 2017, Brazil had 11.4 million civil servants at the three levels of government. Of this total, 10.4% were at the federal level, 32.3% in the states, and 57.3% in the municipalities. The federal servants' share in total public servants fell from 18.1% in 1986 to 10.4% in 2017, due to the substantial expansion at the municipal level. Municipalities employ more than half of all Brazilian civil servants (Lopez and Guedes 2019, 2020).

According to Lopez and Guedes (2020), there are significant differences in average monthly earnings between government levels and branches. At the federal level, the average monthly payments are larger than the state and municipal levels. The Executive branch holds smaller average monthly earnings than the Legislative and Judiciary branches. The majority of Executive civil servants are men, representing 54% of the total in 2017. There is greater equality in the proportion of men and women in the Legislative and Judicial branches.

Within the federal government's scope, management and advisory positions' structure includes the distinction between commissioned ranks – freely provided – and trust functions, exclusive to career employees, but aimed at technical tasks, not necessarily with management components (Since the mid-2000s, some restrictions were imposed to the appointment to these commissioned positions, formulating quotas to public servants, mainly in low and mid positions (see the Decrees no 5497/2005; no 9021/2017; no 9727/2019 and the Law 13346/2016). The President's Chief of Staff investigates top-level positions' background to avoid, for example, the appointment of condemned or prosecuted people (Gaetani et al. 2021).). It is a Y structure – with attributions linked to the management of the machine and managers' advice – conceived during the 1960s (Fernandes 2013; Gaetani et al. 2021).

Studies indicate that the higher the hierarchy of the position held, the greater the probability that the person appointed will be affiliated to a political party, have been selected for political reasons, and remain for a significantly shorter time in their occupation (Praça and Lopez 2019; Lopez and Silva 2019; Lopez and Praça 2018). These positions' spatial distribution has pointed to a movement of centralization in the Republic's Presidency due to the Brazilian coalition governments (Vieira 2017).

In addition to the top management occupation format, there are distortions related to their remuneration structure compared to bureaucratic careers. According to Barbosa-Filho (2018), who compares the Brazilian model to the North American model, in the USA, senior positions (Directors, Secretaries, and Ministers) are remunerated by logic apart from the rest of public servants. Thus, "the maximum basic salary for civil servants' careers in the USA is below the starting salary paid to management and supervisory positions, which would correspond to the positions of Secretaries of State in Brazil (DAS 6)" (Barbosa-Filho 2018, p. 12). In the Brazilian case, the remuneration for high-level managers, DAS 6, who has no connection with the public administration, is lower than the initial payment of civil servants who recently joined the public machine in some management, audit and finance, federal police, or legal careers.

The federal government did several measures to reduce the politicization of top management in the

federal government. Some federal agencies have created commissioned functions that are occupied exclusively by public servants (In some federal organizations, exclusive "commissioned functions" have been implemented in some indirect administration bodies, such as the National Institute of Social Security (INSS), the then National Department of Mineral Production (DNPM), the National Institute of Industrial Property (INPI), the National Institute for the Development of Education (INDE), and the National Department of Transport Infrastructure (DNIT). See Laws 11.355/2006, 12.002/2009, 12.274/2011, 12.443/2011, and 12.898/2013.). The so-called Commissioned Functions of the Executive Branch (FCPE) arose in 2016. FCPE was an extension of the experience of creating these functions mentioned above. Its institution took place by Provisional Measure, later converted into Law No. 13.346 2016. Under this regulation, the federal government converted more than 10.000 DAS commissioned positions into FCPEs, which are exclusively occupied by career civil servants.

Law 13.346/2016 defines the "criteria, professional profile and general procedures to be observed for the occupation of FCPE and the commissioned positions of Grupo-DAS." The National School of Public Administration (ENAP) should support, promote, and coordinate management training programs. Despite this forecast and the FCPE being a relatively comprehensive measure for the whole of the federal public administration, the selection and evaluation of senior management positions are still in the beginning stage. Just recently, Decree nº 9.727/2019 establishes the criteria, professional profile, and general procedures to be followed for the occupation of DAS and FCPE commission positions). In the next section, we provide a profile analysis of top management DAS and FCPE.

## Senior Management in the Brazilian Federal Administration: Occupation Profile

The number of executive and advisory positions and commissioned functions of the Executive Branch in the federal administration (DAS and FCPE posts) is in the order of 22.812 (data from July 2018) (It is important to note that the commissioned functions covered in this section refer to those created since 2006, utilizing specific laws and FCPE organized from 2016 onwards. We considered all hierarchical levels to prepare the graphs.). Although the DAS and FCPE positions represent the backbone of the federal administration's hierarchical command structure, they do not cover all bodies because regulatory agencies, universities, educational institutions, and other types of decentralized entities have differentiated job structures (For the regulatory agencies, different positions were created other than DAS, which are mainly occupied by public civil servants, except the directors, who are appointed by the President of the Republic and scrutinized by the Federal Senate. Universities and federal educational institutes also have a structure of commissioned positions distinct from DAS. As a rule, the directors are chosen by the academic community of these organizations, which are subsequently submitted for the President of the Republic nomination.). We analyzed the positions of Special Nature (NES) to contrast the occupation at the political decision-making level with the political-bureaucratic one, more internal to the public administration.

Currently, 76.65% of these positions are held by public servants or similar, occupants of some permanent public career in the states and municipalities, public employees, military or retired (ENAP 2018a). Graph 1 shows an increase in the number of occupants of commissioned positions regarding public administration relations. The introduction of Law No. 13.346/2016 is followed by a decrease in the number of commissioned occupants without ties to the public administration – those regulations impacted operational and tactical levels (levels 1 to 4 on a 6-point scale).

One of the commonly addressed dimensions of professionalization of the public service is that which refers to the workforce's formal education. The Education Index, which offers an aggregate measure of formal education, was used to analyze that (The Education Index counts the years of study. Thus, within each group, each servant who had "up to elementary" schooling was

**Federal Senior Management, Brazil, Graph 1** Evolution in the number of public servants and no public servants occupying DAS, FCPE, and NES. (Source: Own elaboration, based on data from Integrated Personnel Administration System (SIAPE))

assigned a value of 9; "High school," 12; "Superior," 16; "Graduate," 17; "Master's," 18; "Doctorate," 22. Subsequently, we converted to an index ranging from 0 to 1. The value of 0.53 would be obtained if all servers had higher education.).

As shown in Graph 2, the groups of directors of the federal public administration have a very similar performance concerning the level of education, with a massive presence of occupants with a higher level and a significant number of occupants with graduate degrees. The only noticeable change was the increase in schooling for occupants of commissioned functions after creating FCPE. It is worth noting that this scenario reflects the reality observed for the federal public administration. In conjunction with the extinction or outsourcing of occupations associated with primary and secondary educational levels, recruitment through public exams expanded the workforce's education level in the Brazilian federal government (ENAP 2018a).

Regarding equality, Graph 3 shows the evolution of the sex ratio over time (This indicator refers to the total number of women divided by the number of men for a given category at a given time. Thus, a sex ratio of 0.5 means that there is a woman in the same position for every two men in a specific category (ENAP 2018b).). As can be seen, the sex ratio in DAS's occupation remained practically constant, between 0.7 and 0.76, with an underrepresentation of women in the occupation of positions. As other studies point out, this underrepresentation tends to become particularly more evident with the expansion of responsibilities and remuneration for these positions. So, women's participation at the highest decision-making hierarchy levels is lower (Freire and Palotti 2015; ENAP 2018a).

The exclusive commissioned functions of public servants have a different trajectory. Initially, the index indicated relative equality between men and women in the occupation of these positions. In 2010, however, a decline in women's occupation began, whose declining trajectory continued in the following years.

The trajectories for DAS and FCPE contrast with the positions destined for political agents. In this group, women's participation has always

F

occurred in a minimal number, of approximately one woman for every five men.

As for the race, Graph 4 shows the evolution of the race ratio in the period from 2000 to 2018. As can be seen, in general, the participation of blacks and indigenous people does not reach 0.5 of whites and yellows at any time for any group. Therefore, for every ten whites and Asians occupying commissioned positions, there were less than five blacks or indigenous people. When considering the evolution of the indicators over time, there is no significant difference between the DAS group and FCPE. The values oscillated positively during the period, showing a relative improvement from 0.37 to 0.44, despite the values being distant from the equality of participation and even more distant from the relative participation of the population's race. The value observed for blacks and indigenous people in the political leaders in the administration is unequal. The values fluctuate over the period 2000–2018, remaining around 0.15. That is, for every 20 white and Asian political agents, there were approximately three black or indigenous political agents.

## Conclusions

The design of a career system compatible with the professionalization of strategic public management positions in Brazil is one challenge. Distortions in pay and recruitment undermine part of the federal public administration's effectiveness, and its resolution can reduce asymmetries and inequalities in the public sector (Fernandes and Palotti 2019). Reforms in top management can positively impact public servants' motivation by creating a professional advancement perspective within public organizations. This element currently does not exist and is responsible for setbacks in motivation and, consequently, performance (Correa et al. 2020).

The data suggest no significant differences between the occupants of the FCPE and DAS regarding education or race. We observed a minor difference concerning equality, with a more considerable proportion of women occupying DAS than FCPE. However, there are less women occupying both. An open selection process for commissioned positions would increase transparency and competitiveness, leading to better senior-level civil servants. This selection should consider each candidate's professional profile and academic background based on predefined criteria and establish key performance indicators for each position.

In addition to the need to remodel public careers, the data points to a high inequality associated with individual differences, notably sex. The establishment – and following – of objective selection criteria and the most frequent use of open selection processes would diminish barriers and enable broad participation in fairer contests and lead to more diversity in command of the federal civil service.

# Federalism and Public Administration

George J. Gordon
Illinois State University, Normal, IL, USA

## Synonyms

Intergovernmental relations

F

## Definition

"Federalism": A constitutional division of governmental power between a central or national government and regional governmental units (such as states), with each having some independent authority over its citizens.

"Intergovernmental Relations" (IGR): All of the activities and interactions occurring between or among governmental units of all types and levels within the US federal system (Milakovich and Gordon 2013).

## Introduction: Federalism and Public Administration

Federalism and public administration, even if examined separately from one another, would merit extended coverage and discussion. Indeed, both federalism and its more contemporary adjunct – intergovernmental relations – have a prominent place in the literature of political science (Anton 1989; Chemerinsky 2008; Elazar 1984; Nugent 2009; O'Toole and Christensen 2013; Stephens and Wikstrom 2006). In the context of governance, both federalism and public administration have long histories in the United States, as well as elsewhere around the world (the latter more so than the former, given that most nations today are *not* federal in their governing arrangements).

Federalism, by its very nature, involves greater governmental complexity than is found in non-federal systems of government. A federal

arrangement denotes the existence of at least two structurally separate levels of government, each with legal authority and responsibilities that are distinct from those found at the other level or levels – complicating the exercise of authority, and the maintenance of accountability, at *all* levels. A federal arrangement, however, also suggests the need for "sorting out" in some way the areas of authority assigned to different governmental levels. Fundamental questions about the exercise of authority must be (and have been) addressed by the courts; over time, many decisions (though certainly not all) have confirmed the authority of the national government. Also, in an operational sense, increasing patterns of cooperation between and among different government levels and units have been a staple of US federalism. In addition, conflicts between and among governments are not uncommon, as they try to define and redefine their mutual relationships in the course of responding to the demands of their respective citizenries (Hanson 1983).

Public administration also is characterized by some intrinsic complexity; administrative responsibilities are many and varied, as are administrative agencies. And as *societal* complexity has increased during the past century, the roles and functions of government administrators also have taken on greater significance. Among many other things, the role of subject-matter *experts* in public administration has grown exponentially. Increasing governmental responsibilities in areas such as public health and medical research, transportation, communication, and all manner of government regulation virtually require the guidance of substantively educated and trained personnel, to a far greater extent than ever before and at all levels of government.

We also have witnessed significantly broader impacts of administrative activities on the lives of the citizens whom government programs serve. While the expansion of the role of government, generally, was not smooth or uninterrupted in the nineteenth and twentieth centuries, the influence of government activities in our daily lives is evident in myriad ways. Much of that influence stems from programs managed – and services delivered – by administrative entities and personnel, at all three levels of government in the federal system.

## The Essential Nature of Federalism

Formally, federalism is a *constitutional* division of governmental authority between a central or national government and a set of regional units (such as the American states, Canadian provinces, and Swiss cantons). Under a federal arrangement, both the national and regional governments have some independent powers, as well as some powers they share, over their citizens (all powers must be formally defined, and can vary widely from nation to nation); neither government owes its essential existence to the other (as US local governments do to their respective states); and, as a matter of law, neither may dictate to the other (s) in matters of basic structure, definition of essential functions, or fiscal policies. This definition clearly implies that the regional governments have substantial independence from the national government, but that both may exercise powers of government directly over their citizens. Some crucial questions remain, however, about how two different systems of government authority are to be applied *simultaneously* by different governmental units sharing jurisdiction (i.e., appropriate legal authority) over the same territory and citizens (Milakovich and Gordon 2013).

Federalism is also an explicitly *political* arrangement, related to how power in a governmental system is distributed, structured, and exercised. A federal arrangement is designed to restrain and counteract centralized power through the existence of *multiple* centers of authority. Such a system – with separate, legitimate, and authoritative government units operating individually within the same overall territory – makes it less likely that a central government could achieve an excessive concentration of power, which might endanger individual freedoms. Finally, federalism has increasingly important *fiscal* and *administrative* dimensions. These aspects are related both to the operations of government programs that have impact on at least one other level or unit of

government, and to the growing *complexity* and *interdependence* of programs created, funded, and managed by different governments – both in the USA and in the federal arrangements of government found in other countries (Canada, Brazil, Australia, and Switzerland, among others). They also clearly indicate a link between the actual *operations* of a federal system and the increasingly significant public administrative dimensions of contemporary governance (Anton 1989; Chemerinsky 2008; Elazar 1984; Milakovich and Gordon 2013).

Some of the most important questions relating to any federal arrangement of governments pertain to the distribution or assignment of specific powers and *areas* of authority. In the US experience, the US Constitution is the fundamental source of national government powers, with considerable latitude left to the states – although almost entirely without grants of *specific* state powers. National government authority was created in the form of *express* or *enumerated* (specified) powers, and *implied* powers – both created in Article I, Section 8 of the Constitution. Implied powers have become the basis for a much greater array of national government powers than was probably foreseen even by the most ardent eighteenth-century "federalists" (i.e., by the advocates of national government authority). An 1819 Supreme Court decision was the initial step in this direction, in the case of *McCulloch v. Maryland* (4 Wheaton 316). In the *McCulloch* case, the Court ruled that the so-called "necessary and proper" clause of Article I, Section 8, conferred a *larger*, rather than a *narrower*, range of unstated powers on the national government – as long as such powers had their *roots* in one or more of the express powers.

What, then, of *state* government authority? States, after all, preceded the national government in historical terms; state delegations to the 1787 Constitutional Convention, and individual delegates elected state-by-state, were instrumental in drafting the then-new Constitution; and state ratification conventions had to approve, one by one, the proposed new national governing framework. The Constitution refers to the states and their governments numerous times – but *without* going into any significant detail regarding what powers the states could actually exercise. It was clear, from the outset, that states had wide latitude, through their own state constitutions, to organize their respective governing structures, empower their government officials, set and maintain their basic fiscal policies, and establish the structures and authority of their *local* governments. One thing that the original Constitutional document did *not* do, however, was to settle – or, in some respects, to even meaningfully *address* – the intriguing question of how the national government was to govern over the same territory in which semiautonomous state governments were also to *legitimately function*.

Article VI of the Constitution makes a strong and explicit statement concerning national authority vis-à-vis that of the states – namely, that the Constitution, as well as laws and treaties made under national government authority, "shall be the supreme Law of the Land,. . .any Thing in the Constitution or Laws of any State to the Contrary notwithstanding." That might seem to have settled the question of relative authority, quite definitively. On the other hand, in 1791, 2 years after the Constitution was ratified, the Tenth Amendment in the Bill of Rights seemed to point in a very different direction. There, it is stated: "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." The Tenth Amendment is the foundation of the doctrine of "states' rights" – an enduring and controversial element in the ongoing "politics of federalism" in this country.

It is no wonder that for more than two centuries US federalism has been characterized by ongoing controversy, in part because of these three inconsistent constitutional provisions: (a) the doctrine of implied powers, involving (by definition) a lack of specificity concerning the *extent* of national government authority, (b) the provision in Article VI that the Constitution (apparently including all implied powers) shall be the supreme law of the land, and (c) that all powers not granted to the national government are reserved to the states. There is obviously room for spirited disagreement over whether the states can exercise powers that,

for the national government, are only *implied*. It has been through the political process (including judicial decision-making) that many of the answers to these questions have been provided – often to the chagrin of the losing side. And of course, the Civil War (1861–1865) was fought in part over the issue of national-versus-state government authority.

Fortunately, constitutional law also has long recognized the existence of *concurrent* powers – those that can be exercised by *both* state and national governments. Even in this regard, there has been controversy, although frequently involving less intensity. As the practical authority of the national government has expanded since 1865; however, these fundamental controversies have remained very much a part of our nation's political discourse.

## Public Administration in a Federal Setting

The complexity of public administration is compounded by the existence and operations of independent (and increasingly *inter*dependent) government agencies at multiple levels of government. These agencies are understood, conceptually, to be subservient to the fundamental decision-making authority vested in legislatures, chief executives, and the courts. It also is understood that public administrative agencies act under authority *delegated* to them by elected legislators, especially, and by chief executives. Such delegations of authority usually are made in broad terms, with less specification of *precisely how* administrators are to carry out their broad directives – whether legislative, executive, or judicial in origin. Administrators at all governmental levels thus possess substantial *administrative discretion* in managing government programs.

When legislatures delegate authority to administrative agencies, they also assign *program jurisdiction* to those agencies; the term "jurisdiction," here, refers to responsibility for specified programs in a defined policy area. Thus, while delegations of overall authority tend to be broad, the programmatic focal points for *exercise* of that authority are defined quite precisely, at all levels of government. In addition, administrative agencies can be established on one of several "foundations" of organization, most commonly according to *function* – that is, the general area of policy concern. This means that agencies have policy responsibilities that are defined in terms of, for example, agriculture, public health, commerce, education, and so on – again, in national, state, and local governments.

Because administrative agencies have considerable discretion in their day-to-day activities, legislatures expect (and are expected) to exercise "legislative oversight" – that is, supervision – of administrative activities. Legislative oversight of administration helps to assure that the exercise of administrative discretion remains *generally faithful* to "legislative intent" – that is, the general purposes of the legislative majorities which enacted the legislation. It also is designed to assure that administrators and their agencies can be *held accountable* for their actions, measured (among other things) by how closely they followed legislative (and other) directives. *Whether such accountability can be achieved and maintained* is an ongoing question in all of public administration. We are in a situation today where oversight is diffused among both legislative and executive "overseers," complicating the exercise of *meaningful* oversight by either one. Maintaining accountability is an even more pressing question in a federalism context, where *shared* administration of government programs across governmental boundaries has become more and more commonplace. This complicates matters even further, in that meaningful oversight is made more difficult when administrative responsibility is vested in agencies located at more than one level of government.

A key dimension of administrative operations, at all levels, is the central importance of political power to the ability of administrative agencies to operate effectively (Long 1949), and (especially in national and state governments) the interaction of myriad political forces which seek to affect policy and program implementation. One of the most significant ways in which power is exercised in national-level bureaucratic politics is through

so-called "policy subsystems" – informal alliances of members of Congress, program administrators, and representatives (lobbyists) of "clientele" or "constituency" groups (interest groups) with a stake in the same policies and programs. Subsystems unite legislators (especially in their roles as committee and subcommittee members), administrators, and lobbyists in efforts to formulate and revise legislation and to guide implementation of existing statutes and other directives.

As will be explained further, below, the subsystem phenomenon in national politics is analogous to another type of function-based alliance, one which brings together public administrators in national, state, and local governments. Two essential realities, here, merit attention. First, similarly expert and similarly interested public administrators, at different levels of government, have become natural allies as program management has become increasingly intergovernmental in nature. Second, these patterns of influence have major implications not only for the exercise of influence in program administration but also for the *ability of chief executives at every level* to affect bureaucratic behavior – making it more difficult for presidents and governors, especially, to direct the activities of administrative agencies which are formally part of the executive branch.

## Further Dimensions of Federalism

In any system of government, there are multiple forces contending for influence. Among these, especially within a federal arrangement, are those promoting centralization of decisional authority, arrayed against forces seeking to scatter authority among governmental actors *not* at the center of the polity. To borrow from the discipline of physics, these competing forces may be likened to *centrifugal* and *centripetal* impulses – pulling toward and away from the center of a system, respectively. In US federalism, it is possible to suggest that the national government and state governments represent the focal points of centrifugal and centripetal forces – and certainly some conflicts in our history would seem to bear that out (over, for example, state versus national government authority in a wide variety of policy areas).

However, it should be pointed out that, consistent with our constitutional design, the states have many opportunities to exert their political influence *within* the decision-making processes of the national government. US Representatives and Senators are elected from state-based constituencies, even though they are national government officials. State governments, throughout our history and increasingly in recent decades, have never hesitated to inform national government officials about the policies they would like to see enacted and implemented (see, for example, Haider 1974). And even more fundamentally, the processes of choosing our elected national government officials (including the president, via the Electoral College) reflect at least some degree of deference to state-level political interests (Nugent 2009; O'Toole and Christensen 2013; Stephens and Wikstrom 2006).

The existence of competing centripetal and centrifugal forces suggests an advantage of the federal system that is not always recognized, namely, that a federal arrangement provides *multiple points of access* for citizens – and organized interest groups – in a federal polity. Having such access is not, of course, a guarantee of success for those seeking to influence governmental activity. But the greater the number of points of access, the greater the possibility that citizens and interest groups will find a unit or level of government that will respond to their calls for action. (There is a corresponding likelihood of *greater conflict* in a federal system, as a consequence of having many access points.)

## The Courts and US Federalism

The role of the courts (especially the US Supreme Court) in shaping federalism has been very significant throughout much of our history. In the early 1800s, the Supreme Court first defined some essential boundaries in national-state relations, with long-term implications. At issue was the scope of national government authority, particularly when it overlapped and conflicted with state

powers. Specific questions included whether states could tax national government agencies (they cannot – a ruling that was also part of the *McCulloch* decision); whether the national power to regulate interstate commerce superseded state regulatory actions, setting up conflicting rules (it does, with some exceptions – a ruling first handed down in *Gibbons v. Ogden* [22 U.S. 1, Wheaton, 1824]); and whether state governments were bound to observe the requirements contained in the Bill of Rights to the US Constitution (they were *not*, according to the ruling in *Barron v. Baltimore* [32 U.S. (7 Pet.) 243, 1833], although in the twentieth century, the Supreme Court changed its mind about that, on a case-by-case, protection-by-protection basis).

Shortly after the Civil War, the Supreme Court handed down another ruling that further defined the nature of the federal system. In *Texas v. White* (74 U.S. 700, 1869), the Court held that the Constitution did not permit states to unilaterally secede from the United States – as eleven states had done, thus triggering the Civil War in 1861. In the same decision, however, the Court broadly implied that although state governments are prohibited from seceding from the Union, the guarantees in the Constitution of a "republican form of government" (i.e., self-rule by the people) remain as a protection against abusive national government actions.

Throughout much of the nineteenth and early twentieth centuries, judicial decisions concerning federalism seemed to favor, more often than not, the authority of state governments over that of the national government. However, in the 1930s and 1940s, the Supreme Court began turning back numerous challenges to expanded national government powers – powers that had grown under the New Deal of Franklin Delano Roosevelt. Until the late 1960s, in a time when national government activism continued to expand (especially under President Lyndon B. Johnson, 1963–1969), the Court continued to support that growth of national government authority (much of that support based on broad interpretations of national authority under the interstate commerce clause in Article I, Section 8).

That pattern of judicial support began to shift somewhat, starting in the 1970s. And especially since 1990, the US Supreme Court has handed down a number of significant rulings directly affecting the relative authority of state and national governments. The majority (though not all) of these rulings have favored state authority at the expense of both national authority and citizen rights and remedies.

The Court acted to constrain, and constrict, national authority in a diverse range of cases – cases dealing with (among other things) age and gender discrimination, civil rights, employment conditions, handgun control, and the minimum wage. In the late twentieth and early twenty-first centuries, some observers even suggested that the Supreme Court was engaged in a "federalism revolution," where a central goal was to more clearly define the "boundaries of national versus state authority" (Milakovich and Gordon 2013: 107).

For example, in 1992 the Court, in *New York v. United States* (505 U.S. 144), ruled that the Tenth Amendment prohibited the national government from directing state governments to implement a national government regulatory program. In 1995 the Court ruled, in *United States v. Lopez* (514 U.S. 549), that when Congress passed the Gun-Free School Zones Act of 1990, it had exceeded its authority to regulate interstate commerce. Four years later the Court held, in *Alden v. Maine* (527 U.S. 706), that the state of Maine could not be sued in its own *state* courts – and, by extension, that no state can be sued in state courts without its consent. Finally, in *United States v. Morrison* (529 U.S. 598 [2000]), the Court ruled that the interstate commerce clause does not permit women to sue their alleged abusers in federal court, when alleged private acts of violence do not cross state lines.

During this same time period, the Supreme Court also made a number of decisions *favoring* the exercise of national government authority. In 2004, for example, the Court ruled that the US Environmental Protection Agency (EPA) has authority, under the Clean Air Act of 1970, to "override state officials and order some antipollution measures that may be more costly." In

addition, this decision is an example of the growing phenomenon of **preemptions** – legal actions by federal courts or agencies to preclude enforcement of a state or local law or regulation. These direct assumptions of power have increased significantly during the past three decades, even as prevailing judicial philosophies have pointed in very different directions (Milakovich and Gordon 2013: 108).

It is evident that the courts have strongly influenced the ongoing nature of the federal system. The emergence of intergovernmental relations has served only to increase the impacts of court decisions, because more governments and their actions may be affected by any particular judicial ruling.

## Intergovernmental Relations: The Intertwining of Federalism and Public Administration

A significant development in US federalism is the rise of "intergovernmental relations" (IGR) – a phenomenon of increasingly interwoven government activities (and/or conflict) involving government entities of at least two, and often all three, levels of government. There have been competing assessments regarding several aspects of IGR – when such patterns of governance first began to emerge (in the nineteenth or the twentieth century) (Elazar 1984), the degree of significance of intergovernmental activity during different historical periods, and whether the national government has (or has not) been the "senior partner" in these intergovernmental partnerships (more recent appraisals of IGR lean to the view that the national government has in fact become the most influential guiding force) (Anton 1989).

The rise of IGR illustrates a point made briefly, earlier – namely, that federalism has increasingly important fiscal and administrative dimensions. Most notably, perhaps, starting just over a century ago, the national government began to engage in "fiscal federalism," involving the making of cash grants to other levels of government – initially to state governments, and only indirectly to localities. However, after World War II, the national government began making grants *directly* to local governments. Starting in the 1960s, the scope and pace of direct aid to local units of government expanded dramatically (although the extent of national aid to states and localities has fluctuated considerably over the years, especially during the Reagan administration, 1981–1989). Fiscal federalism has become a prominent feature of contemporary federalism, simultaneously sparking a wide range of new controversies. (This statement applies to national government aid and, to a lesser extent, to state aid to local governments.)

Public administration is at the heart of many of these controversies. Administering national government grant programs requires recognition of, and accommodation to, the existence, prerogatives, and preferences of states and localities that have their own decision-making apparatus and political majorities. At the same time, the growth of government bureaucracy at all levels (some of that growth triggered by the rise of national grants) has helped to reshape important aspects of the federal system.

Intergovernmental aid has become more important because most states and localities have weaker economic bases and less productive tax systems, compared to the national government. The national government can draw upon the economic resources of the entire country as the basis for raising its revenues; states and localities, by definition, have much more limited geographic areas upon which to build their revenue systems, as well as usually *less diverse* economies within their territories. Also, states and localities rely on tax systems (most commonly, sales taxes and property taxes) which produce less revenue in relation to personal income. Yet states and local governments are the primary providers of *direct* public services, in many policy and program areas – education, public health, housing, and law enforcement, to name only a few. The national government *directly* delivers relatively few public services – most prominently Social Security benefits, veterans payments, and agricultural subsidies. Thus the national government, which enjoys the strongest fiscal base and tax resources, carries the lightest burden of service provision; local

governments are in the opposite position, with fewer fiscal resources and greater service burdens; the states fall in the middle, on both counts. (The national government does provide many services *indirectly*, through grants-in-aid, contracts, loans, regulations, etc.) This phenomenon in US federalism has been dubbed a "fiscal mismatch," where the needs and the resources are located, respectively, at different levels of government in the federal system.

## Grants-in-Aid

At the same time that the fiscal mismatch became more pronounced in the first half of the twentieth century, Congress and the executive branch were growing more interested in broadening and strengthening the public services available at all levels of government. Beginning in the 1960s, both national and state governments utilized greater direct financial assistance in order to expand public services – principally through wider use of *grants-in-aid*.

*Grants-in-aid* are money payments furnished by a higher to a lower level of government, to be used for purposes specified by the "grantor" government, and subject to conditions spelled out by the grantor in law or administrative regulation. The national government is the principal user of cash transfers, although states have increasingly used them as well. At the start of the John F. Kennedy presidency in 1961, only 45 separate grant authorizations (statutes) were in existence. (Then as now, multiple allocations of funds can be made under each authorization.) Over the next 50 years, the scope of grant funding increased tremendously – in terms of both the sheer number of grant programs (reaching some 600 in the past decade) (Milakovich and Gordon 2013: 112–113) and the dollar amounts made available by the national government (approximately $700 billion in fiscal year 2017, according to the US Office of Management and Budget).

Grants have taken three different forms since their numbers began expanding in the 1960s: *categorical* grants, general revenue sharing (GRS), and *block* grants. "Categoricals" were the first to be used (dating back to the early 1900s, in fact). GRS was initiated under the Nixon Administration, 1968–1973, but was ended by President Ronald Reagan in 1987. Block grants, which came into greater use as revenue sharing was ending, have been used since then, but on a much smaller scale as compared with categoricals.

It was noted earlier that grants-in-aid, generally, are to be used for purposes specified by the grantor government, and subject to conditions spelled out by the grantor. Categorical grants are characterized by *narrowly defined* purposes, and by considerable detail in the conditions of use – unlike both general revenue sharing and block grants. GRS assistance constituted virtually unrestricted aid to states and localities, for all practical purposes. Block grants have somewhat tighter restrictions on how they are to be used, but the conditions of use are nowhere near as specifically defined, compared to categoricals. Another key difference between GRS and block grants, on the one hand, and categoricals, on the other, is that *elected* state and local officials have had far greater influence over how GRS and block-grant funds are to be used, whereas many categorical grants are subject to decisions made by government administrators who employ their administrative discretion to make a host of important implementation decisions.

That statement suggests an ongoing reality concerning categorical grants – namely, that decisions on how to manage programs funded through categoricals rest largely in the hands of *administrative* (not elected) officials, at all three levels of government. One result of that reality is the phenomenon of "intergovernmental management" (IGM), involving direct and continuous ties between or among government administrators *sharing* responsibilities in the same area. Intergovernmental management stemming from categorical-grant program administration has led to far greater administrative complexity than existed in the past. At the same time, IGM has raised important concerns about *maintaining*

*accountability* for programs largely directed by career public administrators at all levels.

## Intergovernmental Management: Key Features

The preponderant use of categorical grants has contributed significantly to increased interdependence among program administrators at different government levels, greater reliance on political bargaining by those administrators, and (as noted) the rise of greater administrative complexity. Several factors help to explain this. First, from the earliest years of categorical-grant assistance, the national government established a requirement in most grant programs that a *single state agency* be designated to administer the grant funds – *and* to establish direct relationships with its counterpart in the national government bureaucracy. Currently, statutes either name a specific state agency or call for one to be designated, in a whole host of policy areas (hospitals, urban planning, airports, child welfare, civil defense, etc.). Thus, for about a century, the administration of grant funds has been in the hands of professional administrative personnel in individual agencies (Milakovich and Gordon 2013: 118).

A second factor explaining the rise of complexity is the increasing *specialization* of the grant-in-aid system, as a result of which national agency personnel have come to work more and more closely with their state and local counterparts in *day-to-day management* of intergovernmental programs – in agriculture, public welfare, commerce, education, public health, libraries, and highway transportation, among many others. The governing process has been profoundly affected by this strengthening of intergovernmental administrative linkages, perhaps equally significant is the fact that these developments have occurred largely out of public view. The results of these changes have been described by various observers in different terminology, but pointing to the same realities – for example, the rise of "largely self-governing professional guilds" across governmental lines, or "vertical functional autocracies" (the labels depicting both common programmatic interests and extensive programmatic *independence* from chief executives' and legislators' control) (Milakovich and Gordon 2013: 119). Given those realities, these linkages might also be described as *vertical* subsystems, since the administrators involved are part of their own particular policy alliances at their respective levels of government – alliances which then become part of the processes of intergovernmental management.

The development of these "guilds" or "autocracies" gave rise to a new descriptive label for the federal system. In the eighteenth and nineteenth centuries, federalism was characterized almost exclusively as "dual" federalism – akin to a layer cake, where functions at different levels of government were clearly distinguished from one another. Later, growing intergovernmental cooperation was likened to a marble cake, with the functions of different government levels increasingly intermingled. Now, however, the new vertical administrative patterns suggested the emergence of what one observer called "picket-fence" federalism, where "The lines of authority, the concerns and interests, the flow of money, and the direction of programs run straight down like a number of pickets stuck into the ground. There is, as in a picket fence, a connecting cross slat, but that does little to support anything. In this metaphor it stands for the governments [as a whole]. It holds the pickets in line; it does not bring them together. The picket-like programs are not connected at the bottom" (Sanford 1967: 80).

Administrative personnel operating within each "picket," together with their clientele groups at each level of government, do not always agree about precisely what to do or how to do it, in the programs they manage. But even so, it is these functional alliances that essentially operate intergovernmental programs, and resolve the conflicts that arise, on a day-to-day basis. One effect of all this has been to "intergovernmentalize" administrative discretion – making meaningful oversight even more difficult, in the larger picture. How this situation can be reconciled with democratic values such as control by elected officials, accountability *to* those officials, and (through them)

accountability to the public is an important (and ongoing) question – one that is not easily answered (Milakovich and Gordon 2013: 120).

## Conclusion

Administering government programs in the context of federalism involves a variety of phenomena that, at the very least, are more evident than is the case in nonfederal systems. For example, the twin realities of governmental *complexity* and *interdependence* have grown steadily in the twentieth and early twenty-first centuries. The national government has become far more active in domestic policy making, especially in the past half century; intergovernmental cash assistance has greatly expanded (from the national government to both state and localities, and from states to their local governments), accompanying vast growth in intergovernmental relations; and intergovernmental management has emerged as an important feature of both federalism and public administration. Legislatures increasingly have delegated implementation authority to administrative agencies, as essential public responsibilities themselves have steadily become more complex; this in turn has had the effect of enlarging the influence of public administrators, in both relative and absolute terms.

The *combined impacts* of these changes have raised a variety of issues. These include:

1. Continuing questions about the relative roles of national and state governments in influencing domestic policy (their relative influence has never been static, and it continues to change);
2. The ability – and the inclination – of the national government to use its fiscal resources to influence state and local policy directions (as has sometimes been claimed, especially by those unhappy with that pattern);
3. The widening impact of intergovernmental management in national, state, and local programs;
4. Questions about the extent and effectiveness of control by elected officials (both legislators and chief executives) at all levels of the federal system;
5. Related questions regarding whether the larger structure of intergovernmental management still enables us to hold the administrators in charge of those programs *accountable*.

Clearly, federalism is an important component in what one modern observer labeled "the enterprise of public administration" (Waldo 1980). But federalism and public administration have had – and continue to have – *reciprocal* effects on one another. A federal arrangement of governments fundamentally helps to shape government administration. Also, the rise of both IGR and IGM has had significant impacts on the nature and operations of all government programs. At the same time, the federal system itself has been profoundly affected by increased flows of cash assistance, the rise of significant managerial dimensions, and new forms of both cooperation and conflict among the many policy-making actors in national, state, and local governments.

Central and subnational governments; Multilevel government

### Introduction

Federal institutions have been developed in practice. The founding fathers of the USA had a practical problem to solve: how to create a common defense against their former metropole and the Spanish Empire without suppressing the diversity and autonomy of the 13 colonies? The idea of a multilevel government bind by a Constitution was formulated by the necessity to answer this political deadlock. The USA has become the first experience of federalism in modern history.

Since then federal institutions were conceptualized theoretically as a tool to deal with dilemmas involving the necessity to "come together" or "hold together" (Stepan 1999). American federalism is an example of the former. Representatives of 13 colonies at the Philadelphia Convention in 1787 should devise a pathway to join efforts to protect their territory and sovereignty. Giving up part of their autonomy proved to be a successful strategy to maintain self-govern with the newly created federal government. India in 1948 is an example of the latter. Politicians in the Indian multicultural society decided to change from a unitary state to a federal one in order to maintain previous unity. Sharing the power with local elites would create the possibility to keep India united after independence against the British Empire.

Nowadays, according to the Forum of Federations, there are around 25 federal countries, which represent roughly 40% of the total world's population. Although a significant part of these countries has a vast territory and large population – such as Russia, the USA, Australia, Brazil, India, and Canada – some of them are small although with a multicultural society such as Switzerland and Belgium.

Scholars should consider the diversity of institutional arrangements and the constant changes along time in federations as important features to be considered in their studies. On the one hand, it is inappropriate to ignore particularities that matter for outcomes. On the other hand, regularities and common dimensions about federal systems should be taken into consideration for enhancing theoretical production in the area (Souza 2008).

Two concepts should be treated separately in the discussion about federalism: intergovernmental relations (IGR) and coordination. IGR are crucial for federations, although they also exist in unitary countries. Interactions and power relationships between different levels of government are expected to occur in relation to jurisdiction delimitations, the division of revenues, or the responsibility for regulation in some policy fields

I want to thank Fernando Filgueiras, Alessandro Freire, Felipe Avezani, and João Palotti for their comments and suggestions in a previous version of this text. All errors remain my own.

F

(Phillimore 2013). Decentralization and centralization are common processes of power reallocation between political elites.

Coordination is a broad concept applied to intergovernmental relations as well as to public organizations at the same government or to public-private partnerships. In federations, coordination is related to the role of the central government to constrain or convince local governments to execute or implement certain policies or programs, in general with federal support (vertical coordination). Another possibility is the coordination among governments in the same level to face common challenges or to explore opportunities or advantages of partnership (horizontal coordination). In both cases, institutional arrangements matter to enhance the possibilities of success from these partnerships, decreasing incentives for defection or broadening rewards of cooperation.

## Rules, Politics, and Values

The studies about federalism go back to a tradition of public and constitutional law. This tradition emphasizes the importance of formal and written rules to determine if a political system can be characterized as a federation. According to this literature, a "federative pact or contract" between governments in a federation will be signed upon the Constitution. There is a combination of self-rule and shared rule underlining all federal institutions (Elazar 1987). Rules have an important meaning for this approach.

One notable critique of the constitutional perspective is the centrality of federalism to shape the bargains between political elites (Riker 1975; Mckay 2004). Federalism is basically a political arrangement to balance national and local elites in their struggle for power. Federative institutions create incentives and restrictions to political competitiveness between elites. Federations vary on the range that the federal union constraints or respects the autonomy of local units. Depending on the way federations establish this balance, political elites may either support or reject federal institutions.

Finally, federalism can be analytically distinguished from federations. Federalism in this perspective would be the political ideology of enabling broader political participation of local and regional units in government. Diversity is one of the main values behind federalism. This approach emphasizes a common analytical starting point to deal with all the particularities of federations. Under this perspective, the European Union could be taken as an institutional arrangement where federative principles apply, although formally it is not a federal state (Souza 2008).

## Origins of Federalism in Brazil

Brazilian political institutions have been changed many times, giving more or less autonomy to local and regional governments, in a movement similar to "systoles and diastoles" (Almeida 2007). After independence from Portugal in 1822, Brazil had become a constitutional monarchy, although the emperor had strong powers to influence the government. During this time, the emperor could change the whole government by dismissing the prime minister. The state was unitary, so the chiefs of provinces could also be easily removed by the central government. In 1889, a military coup abolished the monarchy and established a presidential republic with federal institutions. Brazil adopted a Constitution very similar to the US Constitution. Some political oligarchies – mainly represented by the governors of São Paulo and Minas Gerais – had great influence in choosing the president of the Republic and also in promoting new paths for economic development. Although the suffrage had reached a small part of the population, periodic elections, even if fraudulent, created the conditions for a dispute between political oligarchies.

During the twentieth century, two coups d'état centralized the political power in dictatorships that in fact wiped out any federal autonomy. The first one was led by Getúlio Vargas, in 1930. Although initially liberal institutions were preserved, some years later the political power was completely centralized in Vargas' government

until 1945. During the next two decades, periodical elections were restored, with more political participation and autonomy to subnational governments. Governors from opposition parties to the federal government were elected in a competitive political environment. In the context of Cold War and of strong political instability at the federal level, this democratic experience was interrupted in 1964 by the Army Forces, initially supported by civil society and by some politicians who expected to come to power. Until 1985 military presidents were chosen by a military junta that centralized power in the central government.

Both dictatorial periods suspended individual guarantees and also the political autonomy of subnational governments. The central government designated governors and the mayors of the most important cities. Although formally Brazil maintained the division of powers of a federal state, in fact the central government operated as in a unitary country. The Executive branch determined public policy formulation and implementation at the national level. State companies were created to promote economic development. Social policies such as education, health, and social security were enhanced by the central government, benefiting workers with formal linkage in the labor market. States and municipalities had a peripheral role in comparison to the federal government.

The restoration of democracy after the Constitution of 1988 marked a new chapter for federalism in Brazil. There are the Union, 26 states, the Federal District, and 5570 municipalities (IBGE 2017). Municipalities were formally integrated in the federal system as independent members. Along with individual guarantees, the federal system can't be suppressed by constitutional amendment.

One last remark about the origins of federalism in Brazil is related to the role of municipalities according to recent historical research. Although Brazil was a colony under the Portuguese colonial empire, municipalities had for a long time autonomy to self-rule. As in Brazil there was no nobility nor the clergy, citizens could elect representatives for the city council and also be elected to it (Caldeira 2017). Regular elections were well-known in part of the territory with a political autonomy greater than in many countries in Europe during this period (sixteenth to eighteenth centuries). The domestic economy was relatively dynamic, even though Brazil had many restrictions to import goods and no autonomy to establish universities and other public enterprises and the exportation was monopolized by Portugal with sugar plantations and gold mining based on slavery.

## Federalism and Public Policies in Brazil

The Constitution of 1988 defined a massive number of legislative attributions to the federal government, local issues to municipalities, and residual legislative attributions to states. The Union can regulate exclusively matters of civil and criminal law, transportation, national education policy, broader definitions about the macroeconomy, citizenship, and defense and establish general guidelines for subnational requirements in the few subjects that states and municipalities can produce legislation. In terms of public policy formulation, Brazil designed a very centralized federation (Souza 2005). There is very low variability in how vital fields of public policy are regulated in the territory. The National Health System, labor rights, principles for civil service, and social security are some of the policy fields detailed by the Constitution of 1988. Subnational entities weren't veto players of legislation changes, even laws or constitutional amendments that established restrictions and additional obligations to states and municipalities (Arretche 2013; Almeida 2005).

Concerning policy implementation, there was a strong expectation on administrative and fiscal decentralization (Arretche 1996). States and especially municipalities were expected to execute public policies in different fields. Subnational entities could create new duties and taxes to afford new expenditures. Despite this high expectancy about decentralization, coordination problems quickly appeared. In fact, "any federative entity was constitutionally authorized to implement programs in the areas of health, education, social

assistance, housing, and sanitation. Symmetrically, no federative entity was constitutionally obliged to implement programs in these areas" (Arretche 2004: 22).

A set of institutional mechanisms were defined within Brazilian federalism to deal with areas of shared responsibility between federal entities since 1988. Those mechanisms can be classified according to the possibilities to stimulate cooperation or produce centralization (Machado and Palotti 2015) and under the perspective of policy instruments dedicated to intergovernmental relations (Radin 2010). Constitutional and legal obligations were widely used, mainly in social policies. States and municipalities were obliged to spend a fixed amount of around 40% of their total budget in health and education policies. Another important mandatory statement was the Fiscal Responsibility Law, which restricts personnel expenses and the entire public debt of subnational entities. Meanwhile, the Union imposed specific regulations to the composition of the city council according to the size of the municipality and fixed policy targets in sanitation and urban regulation.

Another critical policy instrument to shape intergovernmental relations was the conditional transfers of federal resources to the subnational level. A set of federal programs, mainly in social policies, were designed to induce commitments from states and municipalities. After 2000, subnational expenditures surpassed federal expenditures in social policies (Machado and Palotti 2015). The policy design of these conditional transfers was mainly focused on the federal level acting as a principal: defining rules and policy targets and transferring federal budget to subnational entities. Like agents, subnational entities, primarily municipalities, should implement the policy or program – hiring personnel, building infrastructure, and providing basic goods to support public services to citizens. This centralized model of federal design and local provision of public policies has some elements of cooperation through the participation of subnational entities in intergovernmental councils mainly in health and social assistance policies. Although the Union has an active role in settling and processing the agenda, subnational units have space for diverging, debating, and proposing changes for federal programs during the formulation process (Palotti and Machado 2014).

Local governmental associations as intermunicipal consortia enhanced the horizontal level coordination. Fragmentation represents a challenging scenario for public policy implementation since almost 70% of Brazilian municipalities have less than 20,000 inhabitants (IBGE 2017). It demanded institutional arrangements to enhance cooperation between governments – facilitating the allocation and management of public resources but also punishing deviant behaviors. After the Constitution of 1988, the decentralization of public policies to municipalities enhanced experiences of inter-municipal consortia. In 2005, the Public Consortia Law was approved by the Union to give more legal guarantees and regulate the juridical personality of these partnerships. In 2018, there are 491 intermunicipal consortia in Brazil, which bring together about 74% of municipalities. The most common areas of operation are health (55.8%), environment (35%), solid waste destination (28.3%), public infrastructure (24.2%), and sanitation (19.1%), all public goods that could benefit from the provision in a larger scale (CNM 2018). The improvement in the number of intermunicipal consortia is a result of decentralization after the Constitution of 1988, better institutional arrangements with the Public Consortia Law, the regulation of national legislation in some policy fields, and also the inducement of state governments and municipal associations (Grin and Abrucio 2017; Machado and Palotti 2015; Linhares et al. 2017). Despite improved horizontal coordination at the local level, Brazilian states remain poorly coordinated to address regional issues. They are being sidelined vis-a-vis municipalities in the revenue division and are often involved in "fiscal war" to get private investments in their territory, which makes their public debt problems even more severe (Carvalho and Afonso 2018).

Brazilian federalism created a myriad of institutional instruments that enhanced the centralization of public policy formulation and as a

general trend changed the role of Union from direct execution of public policies to shape subnational entities' behaviors. The coordination and regulation promoted at the federal level resulted in better policy results, mainly in social policies. In other policy fields, as in public security, the loosen regulation and failures in implementing a mechanism of coordination between governments produced poor policy results. Although conditional transfers and legal obligations were crucial centralizing policy instruments, intergovernmental councils and inter-municipal consortia appoint to some cooperative features that should not be neglected by analysts and policymakers.

## Emerging Issues

Federations are always in change, and Brazil isn't an exception (Souza 2008). After three decades of democracy, some lessons about intergovernmental relations were learned, and new challenges emerged. There are innovations, unsolved and new demands in the field of public administration and public policies related to Brazilian intergovernmental relations (practical aspects), and new methodologies and interdisciplinary efforts in the study of federalism taking Brazil as a case study (theoretical aspects).

The lack of coordination in some public policies became evident in the last decade. In social assistance, a new model of intergovernmental relations was designed based on the experience of the National Health System. The National Social Assistance System was implemented since 2004 with successful results in terms of public policy implementation (Sátyro and Cunha 2014). Many public security programs at federal level failed, although some experiences at the state level were innovative and relatively well implemented in some states (Sapori 2007). The last attempt at the federal level was the so-called National Public Security System, also based on the National Health System logic. This new strategy aims to coordinate intergovernmental efforts in the area of public security, such as creating an integrated system of information and electronic data and a national program for personnel training.

In parallel to attempts to improve coordination in some areas of Brazilian intergovernmental relations, there is a new wave for fiscal decentralization in the political scenario. During the presidential campaign in 2018, many political actors adopted the general motto of "More Brazil and less Brasilia." A lot of states and municipalities in Brazil are facing huge fiscal debts that are affecting the provision of daily public services. Political pressures for decentralization are increasing direct federal resources transfers from Legislative amendments of the federal budget. Despite the importance of fiscal decentralization for local autonomy, enhancing non-conditional transfers to subnational units can be less effective for public policy results than supporting strategies of "tax capacity building" in subnational governments (Gadenne 2017). Disregarding federal coordination can widen the already high inequalities between Brazilian regions that some political and fiscal mechanisms in the last 30 years have tried to reduce (Souza 2002).

New theoretical perspectives are being formulated, producing alternative explanations about intergovernmental relations or the effects of federalism over different variables of interest. The theory of policy diffusion has been recently utilized to explain intergovernmental relations in Brazil. It has emphasized the importance of innovators, channels of dissemination, the autonomy to reproduce experiences from other federative units, and policy entrepreneurs to policy adoption. Different public policies have been considered from the perspective of policy diffusion, such as the adoption of primary health-care programs and of open government and transparency practices by Brazilian municipalities (Coêlho et al. 2016; Batista 2018), or the diffusion of public administration innovations and of environmental policy instruments between Brazilian states (Palotti et al. 2016; Borinelli et al. 2018).

Another branch of studies is taking Brazilian federation as a case study to test different relations between federalism and other fields of interest in political science, for instance, how federalism

affects elections through different pathways to party nationalization. In multilevel presidential countries, such as Brazil and Argentina, a party nationalization can be carried out through elections for governors, whenever the party does not have a competitive candidacy for presidential elections to benefit from presidential coattails. Federalism enables different nationalization strategies for political parties (Borges et al. 2017).

Individual preferences concerning the vertical distribution of power in federations is another interesting perspective. In Brazil citizens have a "dual identity," since they feel attached to regional and national territories without strong controversy, although individuals living in unequal states prefer more centralized federalism (Arretche et al. 2015). Other studies are focusing on recurrent debates as the consequences of overrepresentation in Congress and the role of the constitutional court. Malapportionment in Brazilian Legislative results in disproportionate shares of revenue transfers to overrepresented jurisdictions, but it is related to patronage and other bonds in the potential economic development of those regions (Hiroi 2018). After the 1988 Constitution, the Brazilian constitutional court had the institutional conditions to assume the role of arbiter of the federation. However, the constitutional court in Brazil judges mainly state-level controversies between legislative and executive branches, with a tendency to favor the latter. In this sense, "judicial review in Brazil is not dominated by intergovernmental disputes" (Vale 2013: 96).

Those examples of political and theoretical emerging issues appoint to the importance of federalism in both the political and academic debates in Brazil. The current experience of democracy and restored federation has shown many opportunities for institutional development and policy experimentation in subnational units and also many challenges related to intergovernmental relations, distributive conflicts and the necessity to reduce inequalities maintaining the autonomy of federative units. More investigations of how federative institutions work are needed to provide better evidence for institutional change and policy decisionmaking in Brazil.

# Feigned Public Policy, Theory of

Hassan Danaeefard
Tarbiat Modares University, Tehran, Iran

## Synonyms

Insincerepublic policy

## Definition

A group of policies that lack the main features are called feigned policies: policy regime, program theory, originality, internal coherence, internal consistency, monitoring and evaluation system, policy design, balanced policy compliance, problem-solving property, and proactivity.

## Introduction

Public policies are critical tools for governments to exercise national sovereignty. The nature of national governance is manifested in such policies. Generally, public policy refers to "a system of law, regulation, and a relatively stable and purposeful set of actions taken by governments

to address current issues, improve the status quo, (Anderson 2003), and hunt for untapped opportunities to improve the quality of life of their people." The higher the quality of these policies (Bolong 2003), the better the government's performance will be evaluated. Therefore, we can calculate government performance based on some criteria such as public policy outputs, outcomes, impact. In other words, the accounting and auditing of public policies, if done carefully, will form a platform for accurately measuring the performance of governments. Accordingly, the indicators that measure government performance in various dimensions in the national arena (for example, the quality of governance, ease of doing business, global competitiveness, etc.) indicate each country's public policies' performance. In other words, the nations' essential capital is not just physical, human, intellectual, etc., but the competitive edge of nations is the public policy of those countries. The current era seems to be the era of policy capitalism, not oil capitalism and natural resources, so the war between countries is a war between policies. And any country that has more sustainable policies will be more successful in the competition course.

Therefore, countries try to improve their public policies with scientific, institutional, and other tools. We claim good policies have the following characteristics: (1) A proper policy regime based on a specific doctrine, (2) Coherence between intra-policy and inter-policy, (3) Internal contradiction or policy paradox, (4) An appropriate theory of program (5) Cost reduction instead of cost transfer, (6) An integrated policy design, (7) A monitoring and evaluation system, (8) Far from overly politicization, (9) They are not just reacting to pressure groups and influential stakeholders, and (10) Free from parallelism with other policies. In other words, policies that have such characteristics can be called "calculated policies." According to McConnell (2010), if the government formulates policies that pursue its ultimate goals and place the following policies appropriately, taking into account the existing public policy design (to fit the overall policy architecture and do not hurt the public), public policies will be more likely to succeed. Therefore, any good policy has characteristics as following: made in the light of extreme care and obsession, and it does not contradict the philosophy and doctrine of governments, does not disturb the domain and general coherence of public policies considers environmental dynamics, and does not conflict with other policies. It should not neutralize the impact of different policies. It should not create problems instead of solving problems. It should not be parallel to other policies. It should be based on a kind of program theory and policy regime to achieve the government's grand goals.

Sometimes, policies emerge in countries' political space known in public discourse as "feigned policies." These policies have a negative image in the national and international minds and inject a soldering culture into the government's policy and society. Whether such an image of policies is only a social construction or an objective identity depends on the philosophical paradigm governing these policy demands. Numerous factors are involved in the formation of these policies, and on the other hand, these policies will have several national and international consequences. This essay aims to introduce and conceptualize this phenomenon and explore its antecedents and consequences.

## A Reflection on Public Policy

All governments, relying on "public policies," inject their political philosophy and political doctrine into society. In other words, in the light of the constitution, governments build their ideal society with public policies. Accordingly, public policies such as the pervasive network dominate all public and private aspects of the elements that shape society (individuals, groups, communities, organizations) and the internal relations between these elements and their external links with the external environment. The degree to which governments intervene in society varies from country to country but the reality is that governments seek, directly or indirectly, to direct national behavior, attitudes, and speech toward what the constitution seeks. Accordingly, although some believe that governments should merely manage society's

public space and leave the private space to society itself, the reality is that governments try to shape society, either explicitly or implicitly, according to the guidelines of the country's constitution. Thus, the objective manifestation of each country's public policies should be seen in the attitude, behavior, and speech of individuals in society, not in the "policy booklets" on the shelves or computer files of ministries and government departments. In other words, although, according to Birkland (2011), policies may be laws or a set of rules and regulations governing a particular public issue, the reality is that the laws, regulations, directives, and ordinances that underpin the existence of policies are public, not the policies themselves (Anderson 2003). The purposeful and relatively consistent set of actions that governments take to address the problem is a more precise reference to public policy (Anderson 2003). Accordingly, public policies are purposeful, encompassing what the government is doing in practice, as a configurational body (in the form of various programs and projects that may expand over time), and can be positive (an actual action of the government in one area) or negative (stop taking a hand-off policy), as well as are law-abiding and authoritarian (Anderson 2003).

Thus, governments at all levels (national, state, provincial, and local) are actively shaping public policy. Every year, many laws and regulations are issued from different national, provincial, and local levels. To this volume of laws and regulations, add a huge body of bylaws and regulations drafted by lower-level executive bodies, organizations, and institutions (according to the parent law), as well as add public policies in new areas (e.g., economic stability, health care, nuclear energy, and consumer protection) to government policies in traditional areas (e.g., foreign affairs, transportation, education, higher education, welfare, law enforcement, business regulation, and labor and international trade). Accordingly, the policymaking systems of countries are composed of subsystems that include iron groups, coalitions, areas of action, policy monopolies, networks, and policy communities (Weible and Sabatier 2019; Smith and Larimer 2016), and public policies are the result of their participation, and if you accept that the relationship between public policies is a configurational body, any changes that occur in the public policies of the upper levels of the policy-making system will inevitably affect the lower levels. In this network of public policies, you will sometimes find policies that do not have the characteristics of a prudent policy. The author has used the common term "feigned policies" to describe and explain such policies.

## The Feigned Public Policies

As mentioned, public policy is a pervasive phenomenon in all current societies of the world. Public policies are the source of advantage and disadvantage, cost and benefit for different groups of people, and aim to increase national welfare and happiness (Anderson 2003). At the same time, it may not be possible to imagine a policy that benefits everyone. Public policies give important status to some and degrade others' quality; it makes some rich and some poor. Public policies are the source of the formation of civilization so that they can oppositely destroy civilization. Wise governments, to protect their civilization, try to implement policies in the society that give hope to the country's future, make the country's current situation pleasant, and beautify the country's past. Therefore, any carelessness in formulating public policies may cause irreparable damage to countries' present and future.

Accordingly, all governments worldwide are regularly involved in the formulation, implementation, and termination of public policies. If you look closely at the public policy networks of countries, you will find policies that have the following characteristics: are not based on some theory, are not based on a single policy regime, consume costs in parallel with other policies, have a variety of contradictions within themselves, and sometimes with other policies, are not coherent from within, are not well positioned, are highly politicized, do not have a cohesive and clear framework for monitoring and evaluation, are not based on an integrated policy, and they are only a response to threats from pressure groups and stakeholders. The author calls theses public

policies as "feigned public policies." Instead of an operational definition of these policies, the author tries to describe them only in the first place. In other words, by mentioning specifications, such policies can be separated from other genuine and real policies. The author claims that such policies have the following characteristics:

1. They do not have program theory
2. They do not have a policy regime
3. Are parallel to the original policies
4. They are contradictory from within
5. They are not coherent from within
6. They are inherently politicized
7. They do not have a monitoring and evaluation system
8. They seek to reduce or transfer costs
9. They are a reaction to pressure and influential groups
10. They do not have an articulated design

Based on this, the above ten criteria can be used to measure the feigned public policies' extent. Some of these elements are better recognizable by professional circles and communities, but others can also be recognizable by ordinary people. One may consider other criteria.

## Antecedents of Feigned Policies

We can see instances of this type of policy in all countries. The privatization of owned-state enterprises in Iran is an instance of these policies. These conditions can sometimes be relatively constant or temporary, such as those referred to in the Sabatier framework (Weible and Sabatier 2019) as relatively stable parameters or extra-system shocks, or in the multiple stream framework (Weible and Sabatier 2019), it is referred to as constitutional structures. Undoubtedly, fixed and changing political, economic, social, cultural, and international conditions affect these policies' emergence. Therefore, such policies are not always deliberately formulated; particular circumstances increase or decrease them at the community level. In the following, we mention some of the main causes of these policies: (1) Lack of policymaking capacity, (2) Political myopia, (3) The imitation of the public policies, lack of party performance evaluation system, (4) Low capacity of public policy implementers, (5) Lack of policy accounting, (6) Political instability in the executive branch, and (7) Culture of holding the government accountable by the citizens.

### Consequences of Feigned Policies

As at first, Schattschneider (1935) and later Lowi 1972 and in recent years theorists of policy feedback theory (Beland 2010; Pearson 1993) and theorists of the policy regime (May et al. 2011; Jochim and May 2010) have argued that policies shape policy, so that the feigned policies will be the basis for the formulation of the feigned politics in society, which will later form other public policies in the light of that policy. The feigned policies affect citizens' speech, attitude, and behavior of citizens, groups, organizations, and communities. Accordingly, governments must pay attention to such policies' effects on the speeches, thoughts, and behaviors of individuals, groups, organizations, and communities. The feigned policies will be the sources of stigma, slander, poisoning of society's discourse, flattery, linguistic strains, and so on. In other words, society's language, which has a significant influence on public policy, constructs policy narratives (Jacobs and Sobieraj 2007) and strongly influences them. Language plays a critical role in the form, content, and nature of the various government and societies (Boroditsky 2001). Some of the most important consequences of this type of policy are as follows:

1. Formation of negative discourse against policymakers in society
2. Creating an atmosphere of accusation and stigma in the political atmosphere of the country
3. National pessimism towards the government and the state
4. Distrust of the government
5. Formation of despair to reform the society among the citizens
6. Creating the effect of behavioral Pygmalion resulting from these policies in the whole society

7. Destroying the psychological capacity of society
8. Creating an atmosphere of destructive media against the country
9. Building negative attitudes against the government in the international arena
10. Adopting hesitant behavior towards the country by other countries

## Conclusion

If we divide general policies into macro, meso, or micro levels, higher-level policies may have been measured and calculated, but lower-level policies may be feigned. As mentioned, the cascading hierarchy of policies extends from the national to the lower local levels, so public policies have horizontal relationships with each other and vertical relationships. If feigned policies become common in the horizontal or vertical network of vertical policies, it also distorts the original policies' mental and practical image. Thus, over time, genuine policies may be "transformed" or "abandoned" or terminated due to the operation of feigned policies, which may be the case with feigned policies themselves. One of the most dangerous consequences of the proliferation of feigned policies is forming a culture of soldering in among citizens, which decline the hope for reform and reconstruction of speeches, attitudes, and behaviors in line with the constitution of each country and, finally, the movement towards improving the quality of national life will slow down.

Undoubtedly, several empirical researches are necessary for a more comprehensive conceptual processing of these policies and their various antecedents and consequences. The author does not claim his theory's comprehensiveness but instead introduces researchers to focus on this public policy type.

# Feminist Approach to Social Service Delivery by Aid Organizations in Rural Nigeria

Chioma Vivienne Nwokoro
Sociology Department, Eastern Palm University, Ogboko, Imo State, Nigeria

## Synonyms

Empowerment; Faith based organizations; Feminism; Nongovernmental organizations; Social service delivery

## Definitions

| | |
|---|---|
| Feminism | Feminism is a social theory that seeks to analyze social issues from the dimension of gender, with aim of establishing and achieve political, economic, personal, and social equality of sexes. Feminist campaigns over the years have contributed to major historical changes such as the women rights' advocacy, women's suffrage, gender equality, and neutrality. |
| Social service delivery | In this entry, *service delivery* is used to define the mobilization and utilization of resources (financial, social, human, and physical resources) by development organizations for the provision of services to disempowered women who probably have no access to productive resources or public services in their communities. |
| Nongovernmental organizations | Vakil (1997: 2060) defines secular NGOs as "*self-governing, private, not-for-profit organizations that are geared to improving the quality of life of disadvantaged people.*" From this definition, one can therefore differentiate NGOs from other groups in the "third sector" such as trade unions, and professional associations, etc. |
| Faith-based development organizations (FBOs) | According to Tadros (2000: 15), a service delivery FBO is defined *as a civil society organization of religious character or mandate engaged in various kinds of service delivery.* In this view, it can be said that service delivery FBOs are faith-inspired development organizations. |
| Empowerment | Alsop et al. (2006: 10) define empowerment as "*the process of enhancing an individual's or groups capacity to make effective choices and then to transform those choices into desired actions and outcomes (agency).*" This definition captures the very nature of the individual or group as "one in control of empowerment or resources" and whose capacity should be enhanced to make effective decisions in the use of these resources. |

## Introduction

The 1980s and 1990s witnessed the growing trust on development or aid organizations as alternative to unstable and unreliable governance in developing countries. These third sector development organizations particularly the secular NGOs and Faith-Based Development Organizations were effectively mobilized by international organizations such as UN, USAID, Word Bank, DFID to assume the role of provision of social services hitherto handled by government in the developing countries. In cases where the state is weak, it becomes essential for these development organizations to provide basic social benefits such as economic empowerment in form of skills acquisition, cooperative and loan society, granting soft loans for agricultural purposes, and other

development activities like providing shelter, clean water supply, health, and educational services to marginalized communities.

Nigeria is currently faced with various problems ranging from endemic political corruption and mismanagement to rising challenges of poverty, insecurity, and an abysmal state of public infrastructure. Given the precarious condition of people, especially women at grassroots, various empowerment programs have been initiated to respond to their deplorable conditions. These programs include the Family Economic Advancement Programme (FEAP), Better Life for Rural Women, Structural Adjustment Programme (SAP), National Economic Empowerment and Development Strategies (NEEDS), National poverty Eradication Programme (NAPEP), and the Poverty Alleviation Programme (PAP). To date, none of these programs have been successful. With the continued precariousness of government services, increasing corruption (even after restoration of democratic regime) and the exacerbation of poverty in the country, more attention was given to local humanitarian organizations by international donors, including USAID (United States Agency for International Development), the World Bank, and others seeking to dispense charity and relief to impoverished rural people. However, in the recent times, it is observed that the service delivery of these local development organizations has not been able to alleviate the poverty affecting most women in the rural areas in Nigeria. In most cases, local development organizations ignore the needs of their beneficiaries to satisfy development objectives. In other words, the local-based organizations focus on satisfying the guidelines of their international partners rather than responding to the main objective of empowerment which is to satisfy the expectations and needs of their beneficiaries. The result of this discrepancies is less trust and affinity of beneficiaries to the aid organizations and continued failure to deliver effective and impacting services to the women. Thus, there is paramount need to address these limitations in the service delivery functions of the local development organizations. One important way of addressing this limitation is through adopting a feminist approach to service delivery in Nigeria. This will enable more insight to the challenges facing women in traditional societies like Nigeria, their limitations, and particular gender issues the aid organizations would address in providing social services to women in rural areas in the country.

The feminist view of service delivery is employed in this work to argue that poverty affecting rural women in Nigerian is engendered by gender inequalities that are persistent and hegemonic in the society. These inequalities are fostered by traditional norms and values that subjugate women under men and in great dimension affect women's welfare especially in the control of relevant resources required for their wellbeing. The argument is that, empowerment of women by the aid organizations should focus on providing enabling environment for women to undiluted power and control over resources hitherto that were unreachable in their societies. In this way, local development organizations will better align their objectives with the reality of the needs of their beneficiaries in empowerment process.

Thus, this entry highlights the essence of adopting the feminist approach in provision of empowerment services to women in rural areas in Nigeria. From this perspective, it emphasizes the prioritization of women's needs over the objectives of the aid organizations, which include ensuring that women provided with enabling environment to gain power and access to resources otherwise in the men's previews.

## The Condition of Women in Rural Nigeria

Although rich in mineral resources, a sizeable proportion of Nigeria's population nevertheless live in abject poverty. Throughout more than 50 years of independence, poverty has been the major challenge to the various governments, which have tried many economic improvement strategies to little avail. Nigeria with its wealth of natural resources, still has a major percentage

of its population affected by poverty. The National Bureau of Statistics (2010) stated that relative poverty in Nigeria rose from 54.4% in 2004 to 69% (i.e., about 99,284,512 Nigerians). Despite the economy's growth, the proportion of Nigerians living in poverty is increasing every year. The Nigerian Poverty Profile (2010) stated that the relative poverty in Nigeria rose from 54.4% in 2004 to 69% (i.e., about 99,284,512 Nigerians) in 2010. Generally, the northern regions are poorer than the south, whereby the North-west and North-east recorded 77.7% and 76.3%, respectively. This has been attributed to class structure and rampant corruption which have further increased the economic gap between the rich and the poor.

Moreover, it is said that poverty is more prevalent in the rural areas than in cities (NBS 2005). Rural Nigeria contrasts sharply with the urban centres, industrialization, and modern life style (Nwokoro 2016). Rural areas are the home of traditional people, traditions, and cultural heritage. The economic system is agro-based, and land, soil, biodiversity, livestock, forests, seas, and plants make up the major resources which the people depend on for their livelihood. Agriculture provides about 90% of the rural livelihood. The result of 2003/2004 poverty survey in using food consumption indicated that about 44.1% of rural population in Nigeria are living abject poverty compared to the urban area which had 26.5% (NBS 2005). Rural poverty in Nigeria results from the precariousness of government. This could be seen in the federal character system practiced in the country. The Nigerian federal character system as it stands gives the federal government the ultimate authority in budget planning, implementation, and allocation. This federal system entails that federal government shares revenue allocation to the state authority which in turn disburses these allocations to the local government for community development tasks. However, this system of government seems to have its disadvantages as it has resulted in bottleneck delays in revenue allocation, increased corruption in government administrations, and inefficiency evidenced in the local governments. Ultimately, this results in poor developments in rural areas in comparison to urban areas where the bulk of the revenue allocations are concentrated and executed.

In rural areas, women (especially widows) are more vulnerable to poverty than men because women are more likely than men to be unemployed and have fewer means of generating income (Nwokoro 2016). Men also have the capacity to migrate from the villages in pursuit of work in the cities, while cultural norms, including being responsible for caring for children and the home, make this nearly impossible for women. The fate of rural women in Nigeria are said to be compounded given the rate of poverty in the rural areas in the country. The recent economic downturns, which are largely a result of decadence in the political system which is characterized by corruption, avarice, negligence of social responsibilities to the public and oligarchy that breeds authoritarianism, have escalated the hardship that most women in Nigeria experience (Falana 2010). Women (especially widows) are said to be more affected by low production due to deprivations of required social services in the country and the discrimination they face in accessing productive resources (Nwokoro 2016). Coupled with this, is the poor development of infrastructures in the rural areas which creates more hardship for these women. The issue of poverty is particularly troublesome for disempowered women since they have fewer opportunities to recover from impending poverty, as they often lack social support and are not equally represented in the legal system.

## Feminist Ideology and Social Service Delivery in Developing Countries

The feminist theory interprets administration of social services with its various features through a feminist lens. This theory as a fundamental element in societal examination is committed to the design of the idea of women and men sharing equally in the control of resources (Mackenzie

et al. 2013). Feminist approach to service delivery employs gender as a focus through which to analyze critically women's wellbeing and empowerment especially with regards to their control and access to required resources for wellbeing and empowerment (Nussbaum 1999). Specifically, feminists expose and test the assumption that a tradition of male-dominated society has fashioned anything other than a "masculine interpretation" of distribution of resources (Nussbaum 1999). In this stead, the theory therefore analyzes women's past exclusion and alienation from social resources (relevant for their survival) and raises issues, topics, and relevant questions neglected. In fact, it could be said that the feminist ideology to service delivery summarizes women's control over resources as a critical issue in their empowerment. Generally, the feminist's view in provision of empowerment services to poor women in developing societies focus on the following issues:

1. Women's control over resources (power over, power with, power to, and power within)
2. Women's access to information
3. Women's participation in decision-making
4. Women's access to financial resources

### Women's Power and Control over Resources (Power over, Power with, Power to, and Power Within)

Power relation is a pertinent issue when discussing women empowerment, especially in highly gendered societies found in Africa. Power is an important content of empowerment analysis, and for development initiatives on empowering poor women in rural areas to be achieved, it is pertinent to review existing power relations in the societal sphere. The dimension of power in women empowerment studies highlights the significance of building capacity of women to challenge existing power status quo that often constrain women's empowerment. Other authors focus on developing assets and capabilities of disempowered women to gain control of productive assets and resources otherwise resided in the men's domain (Narayan 2002). Empowerment is not just participation in decision-making, it also includes the processes that will enable women utilize their internal strength and perceive themselves as able to make decisions that concerns their wellbeing. Women can exert power over resources in various dimensions. (1) Power over is when the person has control over personal decisions; (2) power with is the person's ability to make personal choice; (3) Power to – is the ability to change aspects in her communal life; and (4) power within is the capacity to change negative aspects in her personal life. However, it takes self-reliance and internal strength to develop these capacities in women. Hence, it is the role of development organizations to provide enabling environment (opportunity structures) such as information, trainings, sensitizations, and education to expand the knowledge base of the women to influence change, especially in gaining control over productive assets hitherto were under the men's preview.

Since women's agency could be influenced by societal defects like inequalities, unfavorable traditional structures – the focus should be on the gain of collective power, since individuals can also effectively make choices to combine their individual assets (in terms of her material, psychological, and human assets) with collective assets (voice, organization, and representations) to increase their capacity for challenging traditional structures. Collective power in form of social mobilizations is a key element in supporting women who are socially excluded to realize the power they possess from collective action, and how this collective power can be transformed in gaining control of resources and change (Kabeer 1999).

### Women's Access to Information

For effective empowerment of women to be achieved, development agencies must increase women's informative power, which will allow them to engage effectively in local deliberations and decision-makings that affect their lives (Narayan 2002). This means giving women opportunity to use their voice and demand change

in existing structure that are unfavorable to them. It equally includes a bottom-top approach in disseminating information that would be beneficial in removing oppressions, injustice, and inequalities that exacerbate women's vulnerabilities. Knowledge is power, information is the key, and they are beneficial in sensitizing women's awareness of their human rights, and in terms of holding institutions accountable for impact. Informed people are better equipped to take advantage of the opportunities/services provided to them and to exercise their rights in all ramifications (agency). In other words, this suggests awareness in the use of inner strength and determination (categories of power) to challenge and transform the reality. From this perception, information is like an eye-opener bringing reality to women who have internalized their lower status and have come to accept the inevitable structures. Moreover, expanding assets and capabilities of poor women to participate, negotiate, and influence pre-existing structures should be supported with effective education. Through provision of relevant information on their human rights, uneducated women who often do not know their rights because of ignorance or due to internalized structures, can become strong to challenge undesirable structures in their societies.

### Women's Participation in Decision-Making

Participation as a process is very essential in empowering women because it makes them gain control of decisions required in transforming their lives. They get to change the rules, gain space for their deliberations and debates, and to engage effectively in budget formation, use of local resources, knowledge, priorities, and service delivery. This motivates their desire and commitment to change. The liberal view of participation was meant to mainstream development agencies in practicalities of human development, which became a total failure. This motivated a new era of participation that focus on engaging intended beneficiaries in development projects. This emerged as a dominant mode of participation where the beneficiaries have ownership of services with transfer of power, control, and mobilization of resources. Hence, participation involves owning the process of empowerment. Participation is also essential for the planning, implementing, and ensuring success of empowerment services, and it is the contribution of women beneficiaries that makes this possible.

### Women's Access to Financial Resources and Microcredit

Delivering of empowerment services to women in developing countries is equally viewed in terms of alleviating their poverty through micro-credit, market, social capital, and entrepreneurial skills development supports. Microfinance has been seen as contributing not only to poverty reduction and financial sustainability but also to a series of "virtuous spirals" of economic empowerment, increased well-being, and social and political empowerment for women themselves, thereby addressing goals of gender equality and empowerment (Kulkarni 2011: 15). The framework of this empowerment emphasizes the value of money in transforming women's life. Economic empowerment is critical for poor women's wellbeing. Economic empowerment focuses on eliminating disempowering conditions such as ill-health, hunger, and income insecurity in catering household needs. Poverty and vulnerability work hand-in-hand, and eliminating one, functionally decreases the other. Poor people are continuously poor because the overall development environment does not provide space for initiating necessary social connections, skills, credit, and collective organization for pro-poor entrepreneurial development. Most women are often excluded from market and credit facilities because they are not properly informed or they lack adequate connections to accessing these productive assets. Hence, the role of development agencies will be to provide these opportunities.

Most analysis of poverty is viewed from the dimension of sustainable livelihood and economic wellbeing, and discrimination and social exclusion are considered the major causative factors of poverty. In household level, time poverty

(dislodged leisure time), burden of childcare, and other household wellbeing may fall on single mothers who lack access to external supports. This entails developing dimensions for assessing poverty of single mothers heading household. The dimension of poverty affecting women heading households include burden of catering for the economic, health, educational, and feeding needs of their household and supporting women of this category entails bringing financial benefits that will enable them function properly in society.

## Conclusion

Delivering of social services to the poor women in Nigeria has become an important concern to the international and donor communities given the extent of discrimination and deprivations as well as extreme poverty facing these women in rural areas. Given these challenges, many aid organizations both in the national and local levels have started engaging in delivering needed services to the poor, who mostly dwell in the rural areas in the country. However, an important aspect of provision of social services to women in developing societies like Nigeria should focus on assessing gender forces that limit women's wellbeing and how to mitigate these forces. Nigeria like other African countries is a patriarchal society and as such, women's rights and equality to men are still to be achieved. Thus, in discussing service delivery and empowerment of women in Nigeria, it is pertinent to highlight various issues that mitigate their access to resources, information, participation, and financial resources in their society. This work has been able to address important gender issue that would be relevant in assessing social service delivery to poor women in rural areas in Nigeria. The issue is that for service delivery and empowerment of women to be achieved in highly patriarchal society like Nigeria, women should be provided with the enabling environment for gaining control and access to relevant resources for their wellbeing. However, for women to exert power and control over resources, it is paramount to provide them with the requisite information and enabling environment to participate in decision-making that affect these resources. Through provision of appropriate information and participation (which are the basis of social service delivery of aid organizations), women can gain the required control and power to influence change in decision-making and societal structure that affect their wellbeing.

The entire discussion on feminist approach to service delivery or empowerment can be wrapped up as expansion of women's agency and provision of opportunity structures, which is the role of development agencies. It acknowledges the capacity of the development institutions (NGOs) to provide effective services that would meet expectations of poor women by ensuring enabling environment for accessing resources that are inaccessible due to male-dominant cultures.

# Fiji's Intraregional Trade Outcomes

Suwastika Naidu
The University of the South Pacific, Suva, Fiji

## Synonyms

Export base; Trade in goods; Trade in services

## Brief Definition

Imports of goods: these are foreign goods purchased by the citizens of our country.
Exports of goods: these are the local goods purchased by the citizens in the foreign country.

## Introduction

Trade in the Pacific Island countries (PICs) is characterized by heavy dependence on imports and a narrow base of exports (Pacific Island Forum Secretariat 2020). According to the Standard Trade Model, the differences in the factor inputs are the driver of production possibility frontiers and trade outcomes. Similarly, in the context of the PICs, geographical isolation, lack of resource, and factor inputs inhibit the export potential of the PICs. The level of intraregional trade is quite limited among the PICs, and it is expected to grow in the future. With the establishment of the Pacific Islands Forum (PIF), it is evident that the intraregional trade is likely to expand in the future (Pacific Island Forum Secretariat 2020). The main aim of this essay is to examine and discuss Fiji's trade of merchandise and services over the last 10 years. This essay will also add a critical dimension to the intraregional trade outcomes by assessing Fiji's trading partners over the last 10 years. It will also explore the level and direction of intraregional trade by assessing PIFs of member country's intraregional trade outcomes. The 18 member countries of the PIFs are (1) Vanuatu, (2) Tonga, (3) Tuvalu, (4) Palau, (5) Papua New Guinea (PNG), (6) Kiribati, (7) Nauru, (8) New Zealand, (9) New Caledonia, (10) Australia, (11) the Federated States of Micronesia, (12) Fiji, (13) Cook Islands, (14) French Polynesia, (15) Niue, (16) the Republic of Marshall Islands, (17) Samoa, and (18) Fiji (Pacific Island Forum Secretariat 2020).

## Fiji's Annual Exports, Imports, and Balance of Trade (BoT)

Over the last decade, Fiji is consistently recording a balance of trade deficit. In the year 2010, Fiji's trade deficit was FJ$1,859,231,000, and this trade deficit recorded a whopping increase of FJ$3,781,704,000 in the year 2019 (Bureau of Statistics Database 2020). The trade deficit over the last 10 years has increased by 103.40%. One of the main reasons for the rise in the trade deficit is that imports have significantly increased relative to exports. Two commodities that have significantly increased Fiji's trade deficit are imports of airplanes and helicopters and gas oil. As compared to the imports of machinery, electrical appliances, base metals, live animals, and chemical

products, the imports of airplanes, helicopters, and gas oil have been highly volatile. According to the Bureau of Statistics Database (2020), the import of airplanes and helicopters was FJ$1044.5 million in the year 2019, while the import of gas oil was FJ$473.3 million for the same period. Gold and mineral water remain as two top export commodities for the Fiji Islands. There is wide export potential, and scope for the exports of mineral water as the export revenues from this commodity has increased over the last decade. In the year 2019, the mineral water export revenues were recorded at FJ$293.5 million, and gold earnings were recorded at FJ$108.6 million (Bureau of Statistics Database 2020). Figure 1 shows the widening BoT deficit for the Fiji Islands.

## Fiji's Exports and Imports of Merchandise

### Fiji's Exports of Merchandise

Furthermore, Fiji's top 5 exports by Harmonized System (HS) categories for the last 10 years are (1) prepared foods, tobacco, spirits, and beverages; (2) mineral products; (3) animal products; (4) pearls and precious stones; and (5) textiles (see Figs. 2 and 3) (Bureau of Statistics Database 2020). The ranking of these categories of exports has consistently changed within the top 5 exports by HS categories. The main export items for all of these categories are mineral water, sugar, gold, sharps and flour, garments, and fresh fish. Except for slight variations, these export items have continually been the main export items for the HS categories over the last 10 years. Generally, the percentage contribution from these five categories of exports to the total exports has declined from 77.86% in the year 2010 to 68.91% in the year 2019 (see Fig. 4) (Bureau of Statistics Database 2020). However, the total contribution from these five categories of exports has increased from FJ$1,249,909,000 in the year 2010 to FJ$1,535,774,000 in the year 2019 (see Fig. 3). In addition to the top 5 categories, Fiji is also involved in exporting wood chips, mahogany, cartons, dement, insulated wires, paints, coconut oil, bauxite, skincare products, electric accumulators, sailboats, bricks, and pebbles. These products fall under the 16 categories illustrated in Fig. 5 (Bureau of Statistics Database 2020).

### Fiji's Imports of Merchandise

Moreover, the five key categories of imports by HS categories for Fiji are (1) mineral products; (2) machinery and electrical appliances;

**Fiji's Intraregional Trade Outcomes, Fig. 1** Fiji's annual balance of trade (BoT) for all items. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 2** Top 5 key exports of Fiji. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 3** Total contribution by the top 5 key exports. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 4** Percentage contribution by the top 5 key exports to the total exports. (Source: Bureau of Statistics Database (2020))

(3) vehicles, aircraft, and transport equipment; (4) base metals; and (5) live animals (see Figs. 6 and 7) (Bureau of Statistics Database 2020). The ranking of these categories of imports has consistently changed within the top 5 imports by HS categories. Over the last 10 years, the import of mineral products has consistently remained high for Fiji. The specific mineral products imported are diesel, turbine fuel, motor spirit, heavy fuel oil, and liquefied butanes. As far as the percentage contribution of these five categories of the products to the total exports is concerned, this has increased from 61.84% in the year 2010 to 67.63% in the year 2019 (see Fig. 8). The total contribution from these five categories of imports increased significantly from FJ$3,464,614,000 in the year 2010 to FJ$6,010,521,000 in the year 2019 (see Fig. 7) (Bureau of Statistics Database 2020). In addition to the top 5 categories of imports, Fiji is also involved in the imports of pharmaceutical products, perfumes, cosmetics, wheat, meslin, rice, potatoes, onions, plastics, tires, and plastic articles. These products fall in the 16 categories of imports illustrated in Figs. 9 and 10.

## Fiji's Exports and Imports of Services

### Fiji's Exports of Total Services

Furthermore, Fiji's total export of services has significantly increased from FJ$1,891.4 million in the year 2010 to FJ$3,487.5 million in the year 2019 (Bureau of Statistics Database 2020). The five key exports of services for Fiji are (1) travel services; (2) transportation; (3) government goods and services; (4) telecommunications, computer, and information service; and (5) other business services (see Fig. 11). From the year 2010 to 2019, there has been a slight variation noticed in the ranking of the export of services from Fiji. Over the last 10 years, the growth in the export of services is attributed to the sustained increase in transportation and travel services. The provision of transportation and travel services increased from FJ$472.4 million and FJ$1,215.9 million in the year 2010 to FJ$1,044.4 million and FJ$2,080.50 million in the year 2019 (Bureau of Statistics Database 2020). Exports of travel services are divided into four categories: (1) business conferences, (2) personal services,

**Fiji's Intraregional Trade Outcomes, Fig. 6** Top 5 key merchandise imports of Fiji. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 7** Total contribution by the top 5 key imports. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 8** Percentage contribution by the top 5 key imports to the total imports. (Source: Bureau of Statistics Database (2020))

(3) health services, and (4) education-related services (Bureau of Statistics Database 2020). The total travel services increased from FJ$1,891.4 million in the year 2010 to FJ$3,487.5 million in the year 2019 (see Fig. 10). In addition to the export of these services, Fiji also focuses on exporting manufacturing and maintenance services, construction services, insurance and financial services, charges for intellectual property rights, and cultural services (Bureau of Statistics Database 2020) (Fig. 12).

### Fiji's Imports of Services

Over the last 10 years, the five key categories for the imports of services are (1) transportation services, (2) travel services, (3) insurance and pension services, (4) telecommunications and information services, and (5) other business services (see Figs. 13 and 14). From the year 2010 to 2019, there has been a slight variation noticed in the ranking of the import of services to Fiji. The imports of services have increased from FJ$859.30 million in the year 2010 to FJ$1,714.90 million in the year 2019 (see

**Fiji's Intraregional Trade Outcomes, Fig. 9** Fiji's key imports exclusive of the top 5 import list. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 10** Exports of total services. (Source: Bureau of Statistics Database (2020))

Fig. 13) (Bureau of Statistics Database 2020). Apart from the top 5 key categories of imports of services, Fiji also specializes in importing manufacturing and maintenance services, construction services, financial services, charges for intellectual property, personal and recreational services, and government services (see Fig. 15). Imports of transportation services have

**Fiji's Intraregional Trade Outcomes, Fig. 11** Top 5 key exports of services in Fiji. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 12** Fiji's exports of services exclusive of the top 5 service export list. (Source: Bureau of Statistics Database (2020))

dominated all the categories of the imports of services. The transportation services increased from FJ$512.90 in the year 2010 to $FJ859.1 million in the year 2019, resulting in a growth of 67.50% (Bureau of Statistics Database 2020) (Fig. 16).

**Fiji's Intraregional Trade Outcomes, Fig. 14** Top 5 key imports of services in Fiji. (Source: Bureau of Statistics Database (2020))

## Fiji's Major Trading Partners

Over the last 10 years, Fiji has been consistently reporting a balance of trade surplus with the United States, Tonga, Samoa/Western Samoa, Cook Islands, Kiribati, Vanuatu, Tuvalu, Spain, Wallis and Futuna, Solomon Islands, Papua New Guinea, French Polynesia, and New Caledonia (see Fig. 17) (Bureau of Statistics Database 2020). It has also been recording sustained trade

**Fiji's Intraregional Trade Outcomes, Fig. 15** Fiji's imports of services exclusive of the top 5 service import list. (Source: Bureau of Statistics Database (2020))

deficits with Germany, Federal Republic, United Kingdom, Vietnam, China-Taiwan, Indonesia, Hong Kong, Malaysia, Thailand, Japan, India, Republic of Korea, Australia, New Zealand, People's Republic of China, France, and Singapore (Bureau of Statistics Database 2020) (see Fig. 16). The top 7 major trading partners of Fiji are Singapore, France, the People's Republic of China, New Zealand, Australia, Malaysia, and the Republic of Korea. However, over the last 10 years, there have been variations noticed in the list of top 7 major trading partners. For instance, in the year 2011, Thailand and India were part of the top 7 list of major trading partners of Fiji, while France and the Republic of Korea were pushed out from the top 7 list.

As of the year 2019, the top 5 countries that have recorded the highest trade deficit with Fiji are Singapore (FJ$1,074,332,000), France (FJ$822,268,000), People's Republic of China (FJ$671,911,000), New Zealand (FJ$573,625,000), and Australia (FJ$568,716,000), respectively (Bureau of Statistics Database 2020). In the year 2010, the trade deficit for Singapore was FJ$1,135,936,000, followed by FJ$365,569,000 for Australia, FJ$456,906,000 for New Zealand, FJ$197,435,000 for the People's Republic of China, and FJ$28,689,000 for France (Bureau of Statistics Database 2020).

As far as the 10-year outlook on the major trading partners of Fiji based on the BoT surplus is concerned, the top 5 countries for the year 2019 are the United States (FJ$315,206,000), Tonga (FJ$126,922,000), Samoa (FJ$58,737,000), Cook Islands (FJ$44,927,000), and Kiribati (FJ$38,314,000). In the year 2010, the BoT surplus of Fiji for these countries was FJ$57,703,000 for the United States, FJ$46,862,000 for Tonga, FJ$27,140,000 for Western Samoa, FJ$12,727,000 for the Cook Islands, and FJ$24,930,000 for Kiribati (Bureau of Statistics Database 2020).

## Fiji's Intraregional Trade Outcomes

Furthermore, Fiji's current intraregional trade outcomes can be easily related to the promotion of regionalism after Fiji gained its independence

**Fiji's Intraregional Trade Outcomes, Fig. 16** Major trading partners of Fiji based on trade deficit. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Fig. 17** Major trading partners of Fiji based on trade surplus. (Source: Bureau of Statistics Database (2020))

**Fiji's Intraregional Trade Outcomes, Table 1** Melanesian, Micronesian, and Polynesian groups

| Groups | Pacific Island countries |
|---|---|
| Melanesian | Vanuatu, Solomon Islands, Fiji, Papua New Guinea (PNG), and Timor Leste |
| Micronesian | Federated States of Micronesia, Marshall Islands, Palau, and Tuvalu |
| Polynesian | Cook Island, Samoa, and Tonga |

(Gounder and Prasad 2011)

from the British colony (Gounder and Prasad 2011). The South Pacific Commission and the Pacific Islands Forum were two organizations conceived immediately after Fiji's independence to promote regionalism among the Pacific Island countries. According to Gounder and Prasad (2011), Pacific Island countries can be easily divided into three main categories. These categories are Melanesian, Micronesian, and Polynesian. Table 1 shows the Pacific Island countries included under each of these categories.

Consequently, in recognition of the importance of regionalism to enhance economic welfare among the PICs, Fiji has developed its national Trade Policy Framework that provides strategies for achieving competitive advantage while engaging in intraregional and international trade. As stipulated in the Trade Policy Framework of Fiji, the goal of committing to Regional Trade Agreements (RTAs) is to achieve sustainable economic growth by stimulating investment and trade facilitation in Fiji's export sector. The Fijian Government has already committed resources, capabilities, and key competencies to make Fiji the hub of Pacific Islands trade-related activities. Specifically, this involves creating a conducive business environment and deploying the right trade policy instruments to facilitate regional trade among the PICs (Ministry of Industry, Trade, and Tourism 2015). Fiji needs to address production and supply-side constraints before the nation is able to harness the opportunities that intraregional trade provides to the national economy. In particular, the immediate trade outcomes that can be achieved are an increase in the private sector investment, foreign exchange earnings, wealth, and job creation (Ministry of Industry, Trade, and Tourism 2015).

Additionally, the Fiji Government recognizes that the RTAs will help to eradicate poverty and secure a healthy and sustainable future for all Fijians. Fiji's commitment to intraregional trade facilitation is reflected in its participation in the following RTAs (Ministry of Industry, Trade, and Tourism 2015):

- Pacific Islands Countries Trade Agreement (PICTA)
- Melanesian Spearhead Group Trade Agreement (MSG)
- Pacific ACP (PACP)-European Union (EU) Economic Partnership Agreement (EPA)
- Pacific Agreement on Closer Economic Relations (PACER) Plus
- South Pacific Regional Trade and Economic Cooperation Agreement (SPARTECA)

Above all, the SPARTECA trade agreement is one of the oldest regional trade agreements signed in the year 1980 and implemented immediately in the year 1981, with the key objective of providing duty-free access to all the products produced in the Forum Island countries (FICs) to the Australia and New Zealand markets. Indeed, this is one of the longest, nondiscriminatory, and nonreciprocal preferential trade agreements that exist among the FICs (Ministry of Industry, Trade, and Tourism 2015). The FICs have acknowledged that this RTA has helped to expand the market base by helping the small island economies to gain wider export market access to Australia and New Zealand. Table 2 provides Fiji's data on the level and direction of trade with Australia and New Zealand.

Table 2 shows that over the last 10 years, Fiji has been recording a sustained trade deficit with Australia and New Zealand. Fiji has been exporting textiles, clothing, kava, and pharmaceutical products to New Zealand (Fiji Consulate General and Trade Commission 2020b). Similarly, Fiji's major exports to Australia are gold

Source: Bureau of Statistics Database (2020)

and textile clothing (Fiji Consulate General and Trade Commission 2020a).

Certainly, the clothing, textile, and footwear sector exporters significantly benefitted from this preferential trade agreement, particularly between the years 2001 and 2014. According to the Fijian Government (2015), the SPARTECA-TFC provides employment to 5,500 workers, and most of these workers are women and vulnerable groups in society. In the year 2015, SPARTECA-TFC was replaced by the Developing Country Preference Scheme (DCPS) (Ministry of Industry, Trade, and Tourism 2015). Together with Fiji, the FICs that are part of the SPARTECA trade agreement are Vanuatu, Tonga, Tuvalu, Palau, Papua New Guinea (PNG), Kiribati, Nauru, New Caledonia, the Federated States of Micronesia, Cook Islands, French Polynesia, Niue, the Republic of Marshall Islands, and Samoa (Ministry of Industry, Trade, and Tourism 2015; ESCAP 2012). Fiji's Trade Policy Framework only captures the benefits of the RTAs while ignoring the disadvantages of these trade agreements. According to Oxfam (2009), the SPARTECA trade agreement is too restrictive on its rules of origin requirements and has proven to be administratively burdensome to the trading partners. For example, for products to gain access to the Australia and New Zealand markets, around 50% of the value of the product should be produced in Fiji (Oxfam, 2009).

Furthermore, the Melanesian Spearhead Group (MSG) was initially formed in the year 1986, but the trade agreement was signed in the year 1993. The member countries that form part of the MSG are Fiji, Vanuatu, Papua New Guinea (PNG), and the Solomon Islands. Intraregional trade and economic integration became the top priority item for the MSG countries when Fiji took over the leadership of this regional group (Ministry of Industry, Trade, and Tourism 2015). Specifically, Fiji is working toward strengthening the MSG group by implementing the Skills Movement Scheme (SMS). The primary objective of the SMS is to encourage the temporary movement of skilled labor among the MSG for taking up employment opportunities. Fiji is also working with the member countries to strengthen the investment negotiations and enhance trade facilitation among the members (Melanesian Spearhead Group 2020). One of the main setbacks of the MSG trade agreement is that it is based on the negative list approach of providing preferential tariffs to the member countries. This implies that all the products of the member countries that are in the negative list will not qualify for the preferential tariffs. At the moment, Fiji does not have any items on the negative list, thus putting other

**Fiji's Intraregional Trade Outcomes, Table 3** Fiji's level and direction of trade with MSG member countries

Source: Bureau of Statistics Database (2020)

member countries at a disadvantage relative to Fiji (Investment Fiji 2020). Table 3 provides the trade data on the MSG member countries.

Table 3 shows that Fiji has been recording BoT surplus with the MSG member countries. In particular, the BoT surplus has been volatile as several intraregional factors are driving the changes in intraregional trade outcomes. In most of the trading years, Fiji has recorded the highest BoT surplus with Vanuatu as compared to the Solomon Islands and PNG. For example, intraregional relations, changes in trade agreements, natural disasters, wars, and political tensions are few factors that are changing the direction and level of trade (Kim and Osgood 2019; Grynberg and Kabutaulaka 2019).

Moreover, the Pacific Island Countries Trade Agreement's (PICTA) objective is to strengthen and foster trade integration among the FICs. The parties to PICTA are Fiji, Kiribati, Vanuatu, Cook Islands, Fiji, Nauru, Niue, Palau, Papua New Guinea, Tonga, Tuvalu, Samoa, Solomon Islands, Tonga, Republic of Marshall Islands, and Federated States of Micronesia (Ministry of Industry, Trade, and Tourism 2015). This trade agreement was signed in the year 2001, but the implementation commenced in the year 2007. Although 11 Pacific Island countries have ratified the PICTA, only 7 countries are participating in this agreement. These countries are Vanuatu, Tuvalu, Solomon Islands, Fiji, Niue, Samoa, and the Cook Islands. One of the setbacks of the PICTA is that countries have to make legislative changes to adhere to the provisions of the PICTA. This process is administratively cumbersome, consumes a lot of time, and requires essential government resources (United Nations ESCAP 2018). Table 4 shows Fiji's trade with countries that are participating in the PICTA trade agreement.

Tables 3 and 4 show that over the last 10 years, Fiji has maintained BoT surplus with FICs. In most of the years, Fiji has recorded the highest BoT surplus with Samoa, followed by the Cook Islands and Tuvalu. Although subject to volatility, the increase in Fiji's BoT surplus over the last 10 years is attributed to the gradual decline in the tariffs among the FICs. As part of the PICTA, the participating countries are required to reduce tariffs to zero gradually (APTIAD 2012).

Also, the Pacific ACP-European Union Economic Partnership Agreement was signed after the expiry of the Cotonou Agreement to help facilitate economic integration and trade by providing duty-free and quota-free market access to the products originating from Fiji and Papua New Guinea (PNG). Fiji signed the interim EPA in December 2009 to avoid export disruptions and has ensured

that it continues with its comprehensive EPA negotiations (Ministry of Industry, Trade, and Tourism 2015). According to Borrmann and Busse (2007), the institutional process required to adhere to the conditions of this trade agreement is lengthy and cumbersome and requires a strong institutional framework. It will be challenging for Pacific and African, Caribbean, and Pacific Group of States (ACP) countries to adhere to these conditions as the institutional framework of the developing countries is characterized by red tape and bureaucracy that inhibits the efficient functioning of the public service.

Similarly, the Pacific Agreement on Closer Economic Relations (PACER) Plus enhances regional trade integration by guaranteeing the long-term duty- and quota-free access to the combined market for 36.5 million people worldwide. Fiji joined the PACER Plus negotiations in September 2014 to secure preferential market access and improve trade facilitation arrangements (Lal 2014; Ministry of Industry, Trade, and Tourism 2015). This trade agreement builds on the weakness of the SPARTECA trade agreement. According to the Australian Government (2020), the Rules of Origin (RoO) for PACER Plus is flexible and less restrictive than the SPARTECA. However, for the case of Fiji, these RoO are still restrictive as it requires approximately 40% of value-adding to take place within Fiji.

An assessment of Fiji's intraregional trade outcomes indicates that the governments and policymakers are focusing extensively on the benefits of the regional trade agreements but have failed to provide how these agreements may have negative repercussions on economic efficiency and world economic welfare. Viner (1950) argued that discriminatory RTAs harm the world welfare. Bhagwati and Panagariya (1996) found that countries are better off engaging in RTAs with the geographically distant countries as compared to the neighboring countries. The Trade Policy Framework of Fiji should account for both the positive and negative impacts of RTAs on the national economy.

## Conclusion

To conclude, imports of airplanes and gas oil are the two key drivers of Fiji's trade deficit over the last 10 years. The two key export commodities for Fiji are gold and mineral water. Over the last 10 years, Fiji's export of services has increased as a result of the sustained increase in transportation and travel services. Fiji's imports of transportation services are dominating all the categories of

the imports of services. The Trade Policy Framework of Fiji recognizes that intraregional trade creates employment, earns foreign exchange earnings, and helps to achieve Sustainable Development Goals (SDGs). Fiji has entered into several RTAs, namely, the Pacific Islands Countries Trade Agreement (PICTA), Melanesian Spearhead Group Trade Agreement (MSG), Pacific ACP (PACP)-European Union (EU) Economic Partnership Agreement (EPA), Pacific Agreement on Closer Economic Relations (PACER) Plus, and South Pacific Regional Trade and Economic Cooperation Agreement (SPARTECA), to foster trade facilitation and economic integration among the members of the FICs. There are both advantages and disadvantages to the RTAs. The current Trade Policy Framework is designed entirely on the positive implications of the RTAs on the national economy of Fiji. Fiji's Trade Policy Framework must account for the negative implications of the RTAs on the national economy of Fiji.

# Financial Analysis

José L. Zafra-Gómez
University of Granada, Grenada, Spain

## Synonyms

Financial condition; Financial health; Financial situation; Fiscal distress; Fiscal stress

## Definition

Analysis of financial information concerning public bodies in order to determine their capacity to meet current and future needs while maintaining an adequate level of services to society.

## Introduction

The financial problems experienced in the 1970s by cities such as Cleveland and New York, followed by the global turmoil of the economic crisis that began in 2008, have motivated efforts to understand the economic and financial characteristics of public organizations. In consequence, many studies have been undertaken to develop concepts and define magnitudes to enhance our understanding of these questions, to develop models to evaluate them, and even to predict the financial tensions that may affect a public administration in the future.

Traditionally, the concept of financial situation has been associated with an entity's ability to meet its obligations with the resources at its disposal (Lorig 1941). Accordingly, this concept focuses on the assets that can be converted into cash and on the liabilities that must be met at some point in the future (Berne 1992).

However, in recent years, in the field of public administration, this concept has evolved to take into consideration many other factors that can influence the activities of the municipal authority, and it has been described using terms such as fiscal crisis, fiscal stress, fiscal disaster, fiscal emergency, or financial condition. This orientation reflects the particular characteristics that shape the activities of public institutions and which have led to the consideration of different magnitudes that reflect these issues and their impact on public finances. Accordingly, various dimensions of the issue should be taken into consideration to obtain an accurate evaluation of the financial health of a public entity. In consequence, the application of one concept or another could provoke differences in the evaluation made.

In this entry, in line with other papers in the same field, the concept of financial condition is addressed as one that is fundamental to the financial analysis of public entities. After defining the concept, the main indicators used with respect to public administration are analyzed, with respect to various European countries where this field of study has been widely developed.

## The Analysis of Financial Condition in Public Administrations

As observed by the Governmental Accounting Standards Board in its Concepts Statement No. 1, entitled "Objectives of Financial Reporting," public financial information is analyzed in order to facilitate its interpretation by different users so that these documents may "assist users in assessing the level of services that can be provided by the governmental entity and its ability to meet its obligations as they become due. (...) Financial reporting should provide information about the financial position and condition of a governmental entity" (para. 79).

Similar observations have been made by the IFAC Public Sector Committee with respect to the purpose of the financial information produced by public entities worldwide. In its study "Financial Reporting by National Governments" (1991), IFAC highlights the need for users of public accounting information to have access to information enabling them to assess the overall financial condition of a public entity (Cárcaba 2004).

It seems clear, therefore, that in the financial analysis of public entities, several different dimensions must be evaluated. Various concepts

have been proposed with which to undertake such an analysis, taking into account the characteristics of the services provided, those of the municipality, its population, the fiscal policies applied, etc. An initial approach to financial analysis should include the concept of financial position or situation, i.e., the ability of the entity to meet its payment obligations with the resources available to it. Consideration of this concept provides information about the entity's solvency and liquidity, i.e., its ability to meet its long- and short-term obligations, respectively. However, in order to meet citizens' information requirements in this type of analysis, other magnitudes must also be considered, reflecting not only this aspect of financial and economic information but also others that influence the provision of public services, which may not be reflected in the analysis of the entity's financial position, but are crucial to its financial health. This magnitude is termed financial condition.

However, financial condition is not directly observable, as there is no unequivocal measure that can be applied, and various alternatives have been suggested.

For Groves and Valente (2003), financial condition can be measured through four magnitudes: cash solvency, budgetary solvency, long-term solvency, and service provision solvency. According to these authors, in evaluating financial condition, we should take into account the factors of which it is composed: environmental, financial, and organizational. The first of these affects the creation of demand and the provision of public services. The organizational factor refers to the government's ability to adapt to a changing environment. Finally, the financial factor reflects the status of municipal finances.

In contrast, authors such as Berne (1992) and Clark (1994) have linked the term financial condition to the analysis of income flows and spending and to the determinants that characterize entities in their assumption of financial liabilities, within a specific time frame and in a given economic space or dimension.

According to Berne and Schramm (1986), in order to evaluate financial condition correctly, it is necessary to consider a number of environmental magnitudes related to the needs and preferences of society, the local conditions affecting the provision of public services, the cost of factors of production, the resources available to society, and the public policies that affect the local entity. Thus, financial condition is a complex issue, incorporating both financial and nonfinancial factors, with short- and long-term consequences.

In their studies in this area, Greenberg and Hillier (1995) and CICA (1997) remarked that the financial condition of a municipality could be measured using three indicators: sustainability, flexibility, and vulnerability. Sustainability is defined as the entity's ability to maintain, enhance, and protect the welfare of its citizens with the resources at its disposal. By flexibility, they refer to its responsiveness to changing economic and financial circumstances, within the limits of fiscal capacity, by modifying levels of taxation, debt, or intergovernment transfers. Finally, vulnerability is the entity's level of dependence on external funding, through transfers and subsidies, to maintain public spending.

In view of the above approaches to the question, it seems clear that in order to properly measure the financial condition of a municipal authority, financial, organizational, and environmental factors should be taken into consideration.

In the latter respect, studies have shown that environmental factors affect both the creation of demand and the provision of public services (Bergstrom and Goodman 1973; Groves and Valente 2003). Other authors have extended this characterization. Thus, Leone (1976) studied the relationship between fiscal and financial stress and certain socioeconomic causes, including the aging of the industrial fabric, which in turn is associated with the presence of an extremely heterogeneous population and that of low standards of living. In another study, Petersen (1977) examined the relation between the financial problems of public entities and various environmental factors, such as the proportion of people on low incomes, the rate of unemployment, and the public sector service provision responsibilities. Similarly, Clark (1977) examined how financial indicators may be affected by socioeconomic variables such

as population size, mean family income, and taxable property values. Subsequently, Berne (1992) assessed financial condition and the impact of the following socioeconomic aspects: total population, the proportions of young and old (those aged under 18 and over 65 years), average income, rate of unemployment, and the industrial structure. Finally, these authors concluded that demographic, socioeconomic, and fiscal conditions affect the provision of local public services.

However, it remains unclear just what role should be played by these environmental variables in a model created to evaluate or measure financial condition. Some authors believe there is no place for socioeconomic variables in a measure of financial condition (Wang et al. 2007), but in general they are included in measurements of the financial health of local authorities, in order to take into account the preferences and needs of citizens.

Organizational factors affect the government's ability to determine public policies, take decisions, and implement them, in order to adapt to changes in its environment (Zafra-Gómez et al. 2009a). According to Hendrick (2011), these factors are closely related to the size and system of government and the organizational structure and culture.

Nevertheless, the aspect of prime concern in the proper evaluation of financial condition is that of the financial factor, which reflects the financial health status of the government. Various authors (Petersen 1977; Berne 1992; Greenberg and Hillier 1995; CICA 1997; Groves and Valente 2003; Zafra-Gómez et al. 2009a, b, c; Hendrick 2011) have studied this question in depth and have identified the following key areas:

**Financial Analysis, Table 1** Measures of financial condition

| Long-term solvency | Service-level solvency | Cash and budget solvency |
|---|---|---|
| *Revenues, assets, and other resources* | | |
| Economic and revenue base | Dependence on intergovernmental revenues | Revenues collected and outstanding |
| State economy | Tax rates, fees, and charges | Accounts receivable |
| Revenue capacity | Budgeted revenues | Fund balance and surplus resources |
| Residents and business (growth) | Revenue diversification and fungibility | Cash and short-term investments |
| Physical assets and long-term investments | Revenue reserves | |
| Recurring intergovernmental revenues | | |
| *Expenditures and liabilities* | | |
| Spending needs and demands, costs | Budgeted expenditure (and fixity) | Accounts payable (terms, fixity) |
| Residents and business (growth) | Spending priorities | Short-term debt |
| National and regional mandates | | Short-term liabilities |
| Long-term debt | | |
| Unfunded pension liabilities | | |
| Deferred maintenance | | |
| *Net financial condition: balance* | | |
| Spending needs relative to revenue wealth | Revenue burden | Liquidity |
| | Slack relative to risk | Expenditure relative to revenues |
| | Assets relative to liabilities | Short-term slack relative to short-term risk |
| Attributes – future/current, less/more controllable, external environment or internal fiscal structure, stable/volatile, exogenous/endogenous | | |

Source: Hendrick (2011)

**Cash solvency/short-run solvency**: The ability to generate sufficient liquidity to pay short-term debts (Groves and Valente 2003).

**Budgetary solvency**: The ability to balance the budget or generate sufficient resources to cover expenditure in the current fiscal year (Hendrick 2011: 279). Following the model proposed by Zafra-Gómez et al. (2009b), the concept of **budgetary solvency** can be constructed from three elements:

**Flexibility**: The ability to respond to changes in the economy or in financial circumstances, via modifications to public debt (Greenberg and Hillier 1995; CICA 1997). This concept includes the level of public debt and also the ability to repay it.

**Budgetary sustainability**: The ability to maintain, promote, and protect social welfare, employing the resources available

**Financial Analysis, Table 2** Key indicators of financial distress in Italian local government

| Indicator | Data | Meaning |
|---|---|---|
| Consistency of financial result | Financial result/operating expenses + long-term loan reimbursement | Financial result (FR) is obtained as cash at the end of the financial year + uncashed revenues – unpaid expenses. The FR is considered to be consistent when the above calculation produces a stable result. Negative FR is a clear sign of financial distress, but a very high positive one may reflect a revenue-spending mismatch |
| Quality of financial result | Uncashed revenues from previous year multiplied by operating revenues divided by financial result | This indicator reflects the solvency of the FR. The older the uncashed revenues, the higher the probability of insolvency |
| Consistency of credits on current revenues (>12 months) | Uncashed revenues aged more than 12 months subtracted from operating revenues divided by operating revenues | This indicator reflects the probability of insolvency in relation to current revenues (from taxes, services, and assets) |
| Current financial equilibrium | Total current revenues/commitments for operating expenses + long-term debt reimbursement | The optimum current financial equilibrium is represented by values greater than 1 |
| Rigidity of personnel expenses | Commitments for personnel expenses/ current revenues | Inflexible personnel expenses can cause problems in the current financial equilibrium. This indicator reflects the proportion of current revenues dedicated to personnel expenses |
| Debt limit | Financial expenses/total current revenues | This indicator reflects the proportion of current revenue available to cover financial expenses |
| Theoretical time for paying off unpaid expenses | Unpaid expenses at year end/long-term debt repayment | This indicator reflects the average time (in years) needed to pay off unpaid expenses, assuming a straight-line payment pattern |
| Advance payment by treasury | Advance payment by treasury/current revenue | Advance payment by treasury is required when the local government has liquidity problems<br>This indicator is considered as a sign of pre-default |
| Unpaid operating expenses | Total unpaid operating expenses/operating expenses commitments | The higher the value of this indicator, the longer the repayment period or the presence of a situation in which the government is accounting for unpaid expenses that will never occur |

Source: Rossi et al. (2012)

(Greenberg and Hillier 1995; CICA 1997; Groves and Valente 2003; Hendrick 2011).

**Financial independence**: The level of dependence on external funding received via transfers and grants (Berne 1992; Honadle 2003; Zafra-Gómez et al. 2009a).

**Service-level solvency**: The ability to provide the level and quality of services necessary for the community's well-being (Zafra-Gómez et al. 2009b).

**Long-run solvency**: The long-term balance between government revenues and spending, i.e., the ability to meet future obligations and to address forthcoming fiscal challenges, for an extended period (Hendrick 2011: 281).

On the basis of these definitions, a set of indicators can be designed with which to measure each of the above elements. In this respect, Hendrick (2011) offered a useful summary (see Table 1).

In view of these considerations, it can be concluded that in the financial analysis of a public administration, its financial condition should be assessed, including aspects related to the socioeconomic environment, the government's fiscal policy, and the relevant economic, financial, and budgetary variables.

Taking into account socioeconomic and organizational factors, assessment of the above indicators would provide a measure of whether the

**Financial Analysis, Table 3** Elements of financial factor of financial condition

| Elements of financial condition | | Indicators | Definition |
|---|---|---|---|
| Short-term solvency | | Cash surplus index (CSI) | Difference between net short-term receivables, liquidity, and net short-term liabilities |
| | | Liquidity index (LI) | Liquidity divided by net short-term liabilities |
| Budgetary solvency | Flexibility | Net savings index (NSI) | Difference between the receivables from current budget resources and the budget obligations from nonfinancial current expenditures, reduced by annual amortization payment, including interest and principal |
| | | Taxable value divided by financial charge index (TVFCI) | Taxable budgetary receivables divided by annual amortization payment – interest and principal |
| | | Level of debt per inhabitant (LD) | Outstanding debt of the municipality per inhabitant |
| | Independence | Current financial independence index (CFII) | Current budgetary payables divided by current budgetary receivables except current grants |
| | | Financial independence index (FII) | Budgetary payables divided by budgetary receivables except grants |
| | | Fiscal revenues index (FRI) | Fiscal receivables divided (FRI) by net current budgetary receivables |
| | Sustainability | Nonfinancial budgetary result index (NFBRI) | Current budgetary payables, nonfinancial capital budgetary payables divided by nonfinancial current budgetary receivables, nonfinancial capital budgetary receivables |
| | | Expenditure execution index (EEI) | The relation of actual to budgetary expenditure |
| | | Revenue execution index (REI) | The relation of actual to budgetary revenues |
| | | Payments index (PI) | Expenditure paid over total expenditure |
| | | Collected revenues index (CRI) | Revenues collected over total revenues |
| Service-level solvency | | Current expenditure per inhabitant (CEI) | Current budgetary payables per inhabitant |
| | | Capital expenditure per inhabitant (KEI) | Capital budgetary payables per inhabitant |

entity in question is currently in good financial health – enjoying fiscal munificence – or otherwise, i.e., suffering fiscal stress. Hendrick (2011: 280) defined these concepts as follows:

**Fiscal munificence**: An improvement in financial condition brought about by positive changes in the fiscal environment and related opportunities.

**Fiscal stress**: A worsening of financial condition brought about by negative changes in the fiscal environment and related threats.

## Financial Analysis in Europe

The indicators proposed above, as a measure to be applied in financial analysis, may vary depending on the country in question and the level of government to be evaluated. Most previous research has focused on the financial analysis of local administrations, in part because this level of government is closest to citizens. Accordingly, it is useful to examine how the financial condition of local government has been assessed in various European countries. This section describes the situations corresponding to Italy, Spain, France, and Greece.

According to Rossi et al. (2012), in Italy a municipality or province is considered to be experiencing financial distress when the entity "[. . .] is no longer able to perform its essential functions and deliver due services, or when it is no longer able to meet debt with third parties through the ordinary means of restoring fiscal balance or the debt instrument with off balance sheet items." These authors believe that the indicators required for financial analysis are those listed in Table 2.

With respect to Spain, several papers have measured the financial condition of local entities. In general, Zafra-Gómez et al. (2009c), Garcia-Sanchez et al. (2012), and Cabaleiro et al. (2013) coincide on the main indicators that should be used to measure this concept (see Table 3).

In their analysis of the financial performance of local governments in France, Galariotis et al. (2016) examined the following indicators published by the Public Finances General Directorate and the General Division of Local

**Financial Analysis, Table 4** Financial performance attributes

| | |
|---|---|
| **Revenue composition** | Own revenue/operating revenue |
| | Government financing/population |
| **Costs and expenditure** | Staff costs/operating expenses |
| | Other purchases and external expenses/operating expenses |
| | Investment expenditure/operating revenues |
| **Financing ability and debt burden** | Internal financing capacity/operating revenue |
| | Outstanding debt/operating revenue |
| **Tax rates** | Housing tax rate |
| | Property tax rate on developed land |
| | Property tax rate on undeveloped land |

Source: Galariotis et al. (2016)

**Financial Analysis, Table 5** Financial performance of local government in Greece

| | |
|---|---|
| **Total liabilities/total assets (L/A)** | The reliance on third-party financing |
| **Own revenue/total liabilities (R/L)** | Total liabilities correspond to bank loans (short and long term) together with short-term debts to suppliers, contractors, and other accounts payable (e.g., social security, pension funds, taxes) |
| **Short-term liabilities/own revenues (STL/R)** | The ratio of short-term liabilities to own revenue |
| **Operating expenses/own revenue (OE/R)** | The ratio of operating expenses to own revenue |
| **Subsidies/population (S/P)** | This ratio reflects the per citizen subsidy acquired by a municipality |
| **Own revenue/population (R/P)** | The average per citizen revenue of the municipality, indicative of its financial autonomy and ability to overcome financing problems when central government restricts transfers |

Source: Cohen et al. (2012)

Communities (http://www.collectivites-locales.gouv.fr/), which are used to create detailed budgets (operating budget, investing budget, and local tax data) that local governments are legally required to report (Table 4).

Finally, in their financial analysis of local governments in Greece, Cohen et al. (2012) examined a series of financial indicators based on the 2006 Municipal and Communal Code (Act 3463/2006) and associated regulations (Decision 17838/2010), which added new financial ratios (see Table 5) to be included in financial statements. These authors point out that the "financial performance assessment that corresponds to the intentions of the Ministry of Interior is that ratio analysis should reflect an assessment of a municipality's ability to meet its financial obligations and to satisfy its service obligations to its citizens both currently and in the foreseeable future" (p. 273).

## Conclusions

The financial analysis of public administrations is of fundamental importance in assessing their performance. According to the literature, the best way to perform this analysis is via the concept of financial condition. Different approaches to this concept range from those focused on liquidity or solvency, in the sense of being able to meet payment obligations from available resources to models in which a set of indicators – concerning socioeconomic, organizational, and financial factors – are used to reflect and measure different dimensions of financial condition. Of these, the financial factors are the most important to a financial analysis. Their composition is diverse, spanning different areas of public finance, but an accurate assessment of their impact should include cash solvency, budgetary solvency (i.e., flexibility, sustainability, and financial independence), service-level solvency, and long-run solvency. There is general agreement that an analysis of financial condition provides a useful evaluation of the financial performance of public entities. A favorable situation in the latter respect will facilitate the effective and efficient provision of public services, and this is reflected in the models of financial analysis and in their corresponding indicators, applied to local authorities in various European countries.

# Financial Governance in the Municipal Organization of West Bengal

Udaybhanu Bhattacharyya
Department of Rural Development Studies, University of Kalyani, West Bengal, India

F

## Synonyms

Local financial governance; Municipal finance

## Definitions

**Local governance**: Broadly construed, local governance implies a network of local organizations consisting of the civil society organizations, local functional groups, and also influential individuals associated with the delivery and management of local public services. Local governments, both urban and rural, are just a part of the network constituting "local governance."

**Financial governance**: Financial governance gives stress on ensuring that financial management of an organization is well governed. Strictly following and maintaining the stringent set of rules and guidelines as promulgated by the appropriate regulatory bodies helps the organization to achieve good and effective financial governance.

**Financial accountability**: Accountability (one of the important elements of good governance) conveys the idea based on principal-agent relationships. When someone (agent) is responsible for acting on behalf of another (principal) and whose actions/decisions are subject to principal's oversight, direction, or request, the former is accountable to the latter. The question of financial accountability arises when owners of resources

(principal) and users of resources (agent) are two different entities.

## Introduction

Municipal organizations are the urban local governments belong to the lowest level of governmental subdivisions with position below the central government (at apex level), and state government (at intermediary level). In West Bengal, there are five groups of municipalities, namely, A, B, C, D, and E categorized on the basis of population. Apart from six corporations, there are at present 126 municipalities operating in West Bengal classified into two – Kolkata Metropolitan Area Municipalities (38) and non-Kolkata Metropolitan Area Municipalities (88) (http://www.wbdma.gov.in/PDF/B.pdf). The municipalities are governed by the West Bengal Municipal Act, 1993 and a number of rules and regulations have been framed out by the state government for municipal governance with the objective of decentralization of power. Like most of the states in India, these entities in West Bengal are still heavily dependent on the funds released by the upper-tier governments. There are municipalities which even fail to procure 10% of the total annual revenue expenditure from their own sources of funds. Again, it is not uncommon to find municipalities whose own sources of income account for less than 20% of total revenue income [SFC, 2005, 2008, 2016 (Since 1992, State Finance Commission (SFC) is being constituted by the Governor of respective state to review the financial position of local governments, both urban and rural, at a regular interval of five years] Revenue grants are being released by the state government to provide salaries and allowances for the permanent employees of municipalities. Grants in capital nature are mostly available from both state and central governments under different developmental schemes. These are utilized to perform functions as assigned in the Twelfth Schedule of the Constitution (74th Amendment) Act, 1992.

An institution cannot be governed efficiently and effectively without adequate financial resources. Therefore, procurement of adequate funds by municipalities has important implications for their local autonomy, development, and democratic functioning. Further, it is finance that governs the ability of the local institutions to plan and implement the functional responsibilities. The time is coming when the upper-tier governments may cut down the grants heavily or even refuse to allot any grants on account of revenue expenditure. Thus, to sustain in long run, the Urban Local Bodies (ULB) need to explore new areas for generation of adequate funds. Today, municipalities in India are going to bond markets for procuring funds needed for infrastructure development (as allowed in the guidelines issued by the Ministry of Urban Development and Poverty Alleviation, dated 24/02/2001). The fund which would be generated requires a close monitoring for its appropriate usage. Unless the ULBs build up an effective and efficient financial governance system, needless to mention, their performance in the sphere of fund management will not register any marked improvement.

The main concern of financial management is the efficient and wise allocation of funds to various uses (Solomon 1969, p. 8), and thus, the primary goal of financial management in a profit seeking concern is to maximize the value of the firm (Chandra 2011, p. 21). Some of the eminent professionals (viz. Shim and Siegel 2006) have pointed out the financial manager's responsibility [the responsibilities of a financial manager in a corporate concern may include, per se, (a) financial analysis and planning: determining the proper amount of funds to employ in the firm (b) investment decisions: the efficient allocation of funds to specific assets (c) financing and capital structure decisions: raising funds on as favorable terms as possible, (d) management of working capital (e) protecting the assets of the entity] as financial analysis and planning, investment decisions, financing and capital structure decisions, management of financial resources, and risk management (ibid. p. 2). Municipal organizations must make economic choices and all have an obligation to use scare resources efficiently, just as a profit making organization do. Since these local bodies commit large sums of money to projects that incur costs and generate benefits over a

long period of time, either for the investment decisions or financing decisions or the both, a proper financial planning and governance is a must for these institutions to get the best results.

### Objective of the Study

The main objective of the study is to focus on the various issues that are now been addressed to while dealing with the implementation of effective financial governance mechanisms of municipal organizations with particular reference to West Bengal. While the study starts with the basic framework of financial management in government organizations, it highlights on the present areas of sources of income of municipal bodies in West Bengal, pointing out the reasons for poor collections under own sources of revenue and also giving stress on the areas for generation of revenues on sustainable basis. Attempts have also been made to highlight on the need of managing expenditure and assets of the municipal bodies to ensure a better financial management and finally, suggestions have been offered to improve the financial management scenario of these urban local entities based on practical experiences, field study, and exercising some basic principles of financial management.

### Data Source and Methodology

The present study is a descriptive one, and it has not directed towards testing or confirming any hypothesis. The study is based on secondary sources of data and available literature on the issue. The major sources of secondary data consist of up-to-date annual report of the Department of Municipal Affairs, Government of West Bengal as available in the departmental website. Besides the approved budget copies of different municipalities in West Bengal as available in the office of the Director of Local Bodies, West Bengal, related Acts, Rules, government orders, etc., are also a good data source for the study. The studies made by different consultancy bodies on the related issues during the past several years are also considered carefully to obtain the necessary data and information. The articles published in Indian and foreign journals, books on the financial management of corporate bodies and not-for-profit seeking concerns including government organizations are very useful sources of knowledge in the study. Finally, reports on financial practices of government organizations published by international organizations like World Bank, Asian Development Bank, DFID, UK are also major sources of data used and interpreted in the present study.

## Framework of Financial Management in Government Organizations

In general, financial management encompasses the domain of financial analysis and planning, investment decisions, capital structure decisions, and risk management of an organization. For the business enterprises, the scope of financial management is much wider than the government enterprises. It deals with determining the proper amount of funds to employ in the firm, specific allocation of funds to specific assets (investment decision), raising funds on as favourable terms as possible, and also protecting the organization's assets. The decisions with regard to the net profit distribution are known as dividend decisions.

In case of financial management of government organizations like ULBs, there is no scope of dealing with dividend decisions. The investment decisions are also very restricted to developmental projects funded by the upper tier governments. Only financial decisions relating to procurement of funds out of own sources or the other are very crucial so far the financial management is concerned. In view of the limited scope of financial management in government entities as compared to corporate bodies, the objective and basic elements of financial management in not-for-profit organizations are dealt with in the subsequent sections. The broad financial management objectives of governmental enterprises would be to *maintain accountability and establish financial control over funds* (JFMIP 2004, p. 9).

The basic elements of an effective financial management system of municipalities in general may be pointed out as below:

### Accounting and Financial Reporting

Accounting is fundamental to stewardship of public funds. The purpose of accounting is to record financial events and ensure accountability as required by law. Accounting data must also provide the basis for program performance measurement. Accounting principles and standards govern when, where, and how financial events are executed and recorded and provide for accountability through agency and consolidated financial statements required by law (Bhattacharyya 2005, pp. 53–54).

On the other hand, the financial reporting serves purposes of depicting accurate, current, and complete disclosure of the financial results of financially assisted activities, and it must be made in accordance with the financial reporting requirements as prescribed in prevailing laws and rules as applicable.

### Internal Control

Internal control systems are basically management control systems with a view to ensuring compliance with rules and regulations, reliability of financial data and reports, and to facilitate efficiency of government operations. A sound internal control framework requires to assure that government operations attain some basic fiduciary standards in guarding against misuse and inefficient use of resources, for safeguarding government assets, countering fraud and errors, checking maintenance of satisfactory accounting records, and whether budgetary objectives set out in the government policies are being achieved. Das (2007) has correctly pointed out that *"Internal controls can be regarded as one of the foundations of good governance and the first line of defense against improprieties."*

Therefore, the internal control assures the achievement of the following objectives:

1. effectiveness and efficiency of operations;
2. reliability of financial reporting; and
3. compliance with applicable laws and regulations.

Internal control is considered as an inseparable process of management of ULBs fulfilling their mission and achieving their goals in the course of safeguarding and protecting governmental resources. Internal Control consists of five interrelated components. These components are:

#### Control Environment

The control environment may be described as the attitude that management has about internal controls. It is said that *an effective control environment is an intangible factor that sets the foundation for all other components of internal control* (Arkansas Government, 2015).

#### Risk Assessment

Risk assessment is the process that has been applied to identify, analyze, and manage the potential risks that could hinder or prevent an organization from achieving its objectives (ibid.).

#### Control Activities

Internal Control Activities include a wide range of diverse activities such as approvals, authorizations, verifications, reconciliations, performance reviews, maintenance of security, and the creation and maintenance of related records that provide evidence of execution of these activities as well as appropriate documentation (ibid.).

#### Information and Communication

In the course of running and controlling the operations as well as achieving the desired results, municipalities need communications relating to both operational and financial data at all levels of the entity in a relevant, reliable, and timely manner.

#### Monitoring

Subsequent to implementing internal controls, it is necessary periodically to monitor and evaluate their effectiveness to ensure that the control mechanisms are functioning properly. Potential weaknesses in internal control structure may be identified by Statutory Audit, Internal Audit, or employees/whistle blowers of ULBs.

### Budget Control

Actual expenditures or outlays must be compared with budgeted amounts for each grant or subgrant.

Financial information must be related to performance or productivity data, including the development of unit cost information whenever appropriate or specifically required in the grant or subgrant agreement.

### Compliance

ULBs must comply with central and state government laws and regulations, local ordinances, laws, and other legal requirements. Needless to mention, adherence to the rules and laws is one of the basic elements of good governance.

## Techniques of Financial Management in ULBs

There have been a number of techniques that are now being considered essentials for financial management of government organizations like ULBs. Some of them are discussed as below:

### Cash Management

The cash management function of any organization is responsible for establishing and maintaining a set of policies and procedures with the dual purpose of ensuring that funds are available to cover payments made for program purposes, while also ensuring that neither state nor central funds have been drawn unreasonably in advance of when they are needed to pay for program expenses.

Urban Local governments must perform a delicate balancing act in the process of cash management. On the one hand, they need enough liquidity to meet operating expenses and other cash demands; on the other, they need to invest their funds to earn as much revenue as possible. To make a balance between the two, local governments must maximize revenue without putting their funds at risk and must conduct their affairs under the watchful eye of the citizenry.

The basic objectives of Cash management include: managing liquidity, accelerating collections, maximizing investment earnings, reducing the need to borrow fund, managing disbursements efficiently, and also providing accurate and timely reporting. Knowing how much cash is on hand is a very important part of the cash management function. Banks provide periodical *bank reconciliation statement* to their clients. Governments can use these statements to check their internal records against the bank's records to make sure all incoming and outgoing cash is recognized and accounted for correctly.

### Revenue Management

As the sources of resource procurement are limited, every effort should be taken so that the maximum procurement is possible out of the existing sources of revenues and at the same time initiatives should be taken to explore the new areas for generation of further revenue resources.

In procurement of fund out of "generation of own sources" and "fund received as revenue grant" from upper tier governments, the following procedures should strictly be adhered to:

1. The ULBs should have an effective revenue collection system consistent with credit control and debt collection policy.
2. The revenues due to the ULBs need to be calculated on a monthly basis.
3. The accounts for ULB tax and charges for ULB services are to be prepared on a monthly basis or less often as may be prescribed where monthly accounts are uneconomical.
4. All monies received need to be promptly deposited into the ULB's primary bank/ Treasury accounts.
5. ULBs have to maintain a management, accounting and information system which
   - Recognizes revenue when it is earned
   - Accounts for debtors
   - Accounts for receipts of revenue
6. It is needed to develop and maintain a system of internal control in respect of debtors and revenue
7. All revenues received by the ULBs, including revenues received by any collecting agent on its behalf, should have to be reconciled at least once a week.

### Expenditure Management

The objective of expenditure management is to identify the areas where minimization of cost is possible keeping in view of maximizing the usage

of available resources. It helps to reduce unit cost at a significant rate. To ensure an effective and efficient expenditure management of municipal organizations, following are the techniques need to be taken into account:

- The ULBs should maintain an effective system of expenditure control, including procedures for the approval, authorization, withdrawal, and payment of funds.
- The ULBs need to maintain a management, accounting, and information system which
  - recognizes expenditure when it is incurred;
  - accounts for creditors of the ULB and
  - accounts for payments made by the ULB.
- The ULBs must have to maintain a system of internal control in respect of creditors and payments.
- Payments by the ULB are to be made
  - directly to the person to whom it is due unless agreed otherwise for reasons as may be prescribed; and
  - either electronically or by way of non-transferable cheques, provided that cash payments may be made for exceptional reasons only, and only up to a prescribed limit.
- Efforts must be taken so that all outstanding expenditure of the ULBs can be paid within 30 days of receiving the relevant invoice or statement, unless prescribed otherwise for certain categories of expenditure.
- Every care should be taken so that the available working capital of ULBs is managed effectively and economically in terms of the prescribed cash management and investment framework.
- As prescribed in the Municipal Accounts Rules, all financial accounts of the ULB are to be closed at the end of each month and must be reconciled with its records.

### Asset Management

Good management of local authority-owned property assets is as important as the management of other resources within the entity. Maintaining of an up-to-date and comprehensive asset register should be the first step by local authorities in meeting the criteria of "best practice" as part of an authority-wide property strategy. For the effective, efficient, and economic delivery of services, it is vital that all property holdings are utilized to the maximum advantage within the current framework of management.

An asset register should contain the following records for the purpose of financial management:

- All property owned or occupied (with a note on tenure)
- Assets under public domain
- Infrastructure assets (highways, coast defenses, monuments, etc.)
- Council housing and other local authority housing (e.g., service tenancies)
- Specialized buildings (leisure properties, crematoria, abattoirs, etc.)
- Leased property and properties where authorities have user rights
- Buildings under construction

Earlier, the municipal bodies in West Bengal, both Kolkata Metropolitan Area (KMA) and non-KMA, do not have a clear record of the assets owned by them. After the introduction of the National Municipal Accounts Manual (2004), the first opening balance sheet of municipalities has been prepared and duly certified by practising Chartered Accountants. One of the key advantages that derive from such conversion (i.e., from single entry recording system to accrual based double entry recording) is identification and valuation of assets, both movable and unmovable, and to examine the present status of assets, particularly in cases of bare lands and municipal buildings.

## Scope of Resource Enhancement

As prescribed in the law, the municipal bodies in West Bengal prepare their annual budget in the format as provided in the Accounts Rules showing an estimated income and expenditure well ahead of beginning of financial year, and the said budget must be approved by the Board of Councillors in a specially convened meeting. The municipal budget may be considered as an important instrument so far the financial governance is

concerned. Assessment of existing sources of revenue income as shown in the budget estimate of municipal entities and identifying reasons for poor collection and rectifying them with the objective of revenue enhancement, and also exploration/identification of new avenues of revenue generation can be a good mechanism of effective financial control over these organizations.

The following processes may be considered as an effective tool of resource enhancement of municipal organizations:

### Proper Management of Existing Sources of Revenues

The prevailing sources of revenues can be identified by way of analyzing budget heads of account. Proper management of existing sources of revenues can be ensured by following the steps as below:

Step I: Marking out the prevailing sources of revenues;
Step II: Fixing up of current demand (head-wise) as supported by the municipal budget;
Step III: Comparing the current demand with that of actual collection;
Step IV: Pointing out the reasons for poor collections, and
Step V: Suggesting methods for better collections.

### Identification of New Areas of Revenue Generation

To strengthen the financial base of municipalities, it is not enough to give stress on the existing sources of finance with the objective of achieving highest level of procurement, but at the same time, efforts are also to be made on exploring the potential areas for generation of revenue income.

Following areas may be considered where from ULBs can generate revenues without increasing the financial burden of their citizenry:

1. Municipal authority may demand a share of the amount collected by the service providers like Power utilities, Telephone companies (both land line and mobile), Cable TVs, etc., who are using the municipal properties.
2. Collection of installation charges of mobile towers under jurisdiction.
3. Imposition of fees on door-to-door garbage collection.
4. Like Hyderabad Municipal Corporation, *Impact Fees* may be levied on shopping malls, multiplexes and residential-cum commercial complexes and it may be used for road widening, link roads development, fly-overs maintenance, etc.

Besides, any untapped areas must be explored. For example, a municipality can impose levy on Special Conservancy Charge to all citizens residing in municipal area as prescribed in section 95B of the West Bengal Municipal Act, 1993 for the removal of solid waste. Some municipalities (e.g. Bhatpara, Maheshtala) are running plants for processing solid wastes and sale proceeds of the end product (manure) of the operation is a regular source of own source of revenue.

Possibility of tying up with private organizations for collection of revenues (e.g., parking fees, tax on advertisement) under Public-Private Partnership (PPP) model has now been explored by many municipalities. There is no denying the fact that there are areas where the unit cost of providing services by ULBs to the citizen is much higher because of higher establishment cost. One of such areas may be identified as sanitation and garbage collection. If the ULBs can get these types of services done by private parties on contract basis at a lower cost, it will certainly be a positive effort for cost reduction which ultimately improves the financial health of ULBs.

### Capacity Building

Capacity building is a process by which individuals, groups, organizations, institutions, and societies increase their abilities to perform core functions, solve problems, define, and achieve activities. It has now become a familiar and popular concept in the realm of public policy. Initiation of capacity building of ULBs' staff and employees is a prerequisite for making successful expenditure management as well as revenue enhancement. In the decentralization process, it is necessary to enhance various kinds of

capacities, namely, intellectual, organizational, social, political, cultural, material, and financial. It will help to understand the problem and identify how to deal with the development needs in a broader context and sustainable manner. The components of capacity building include training and human resource development.

Therefore, it is necessary that the ULBs have to make arrangements for regular training of their staff and employees either having arrangements with the government or engaging private organizations with a good track of record of imparting appropriate training. It is, however, important to note that training is not one time event, it should be continuous, frequent, and need based taking into account of newly emerged techniques of modern municipal management.

But training should not be restricted to the salaried employees only. Considering the basic concept of local governance, the target groups should include elected representatives, officers of transferred institutions, voluntary experts of different organizations, and also experts from research and academic institutions.

Besides, provisions are to be made for need-based training to ward committee members, members of community development, and other stakeholders who are one way or the other associated with the functioning of municipalities. At the same time, newly elected councilors who have no earlier exposure in the activities of municipalities should also be included under the training net. Finally, stress will be given on citizens' awareness programs (sensitization) which will ensure a positive impact on the performance of municipalities.

## Suggestions and Conclusions

It has been observed in earlier sections that there are possibilities of improving financial position of ULBs in West Bengal by exercising proper application of financial management tools. A common drawback which prevails in most of the ULBs may be traced out as deficiency in keeping proper registers and lack of monitoring and control. All these are essential to give effect of economic usage of resources. Further, in the present administrative and infrastructure setup, it may not be possible for a municipality to pinpoint the areas of possible improvements. The key areas where immediate attentions need to be given are:

1. A comprehensive exercise should be taken up regarding broadening and deepening the revenue base of urban local governments. In the process of resource mobilization, the four key points need to be taken care of, namely, (i) potential for taxation, (ii) fixation of realistic tax rates, (iii) widening of tax base, and (iv) improvement of collection machinery.
2. All common property resources vested in the ULB should be identified, listed, and made productive for revenue generation (it may be noted that the Constitution of India confers ownership of all water resources to the government). The opening Balance Sheet of ULB as prepared following the rules prescribed in National Municipal Accounts Manual and duly certified by Practising Chartered Accountant may be helpful for such identification.
3. It is not uncommon in abroad and even some cities in India, where the ULBs are running and managing utilities such as transport, water supply, and power distribution on a sound financial basis and viability. The similar practice may be followed in West Bengal preferably by clubbing three or more large municipalities (A category).
4. Serious discussion need to be initiated to see the possibility of restricting the role of state governments only to prescribe the band of rates for municipal taxes and levies.
5. It may be considered to give a substantial share of the royalty from minerals to the ULB(s) as collected by the State Government. In its final report the Fourth State Finance Commission (2016) put a serious note regarding sharing of royalty while recommending grants to the local bodies.

Considering the experiences of countries abroad, the following steps may be implemented

to improve the overall position of financial management scenario of our country in general and West Bengal in particular:

- At least 80% Property Tax collection to be ensured with respect to demand notice.
- Possibility of introduction of bye-laws is to be explored for revenue mobilization.
- Possibility of introduction of Public-private Partnership (PPP) model should be looked into for providing basic amenities like water and sanitation which may facilitate to reduce the burden of municipal expenditure.
- Immovable assets like bare land may be developed (e.g., creation of park, picnic spot, buildings for commercial usage, community hall) to generate revenues. The PPP model may be considered for successful implementation of such projects.

Finally, it may be pointed out that the 74th Constitution Amendment Act does not confer the ULBs to raise income by imposing taxes on varied areas. ULBs are therefore heavily dependent on funds released by the upper tier governments, both state and central. Such a bottle-neck is a threat to the process of decentralization of power in its true sense. However, so long as the appropriate measures are not taken on the part of the upper tier government in widening the income base of ULBs, the urban local governments should have to follow the strict principles of financial management and also practise the same in their day to day operations for maximum utilization of the scare resources.

# Financial Health and Distress in Local Government

Emanuele Padovani
Department of Management, University of Bologna, Bologna, Italy

## Synonyms

Financial condition; Financial performance; Fiscal distress; Fiscal health; Fiscal strain

## Definition

Financial health of a local government refers to its ability to be solvent, both in the short and long run, and at the same time to maintain a certain minimum level of services for its community; the related concept of fiscal distress is associated with the ability of a local government to meet short- and long-term financial obligations and avoid State takeover or bankruptcy.

## Introduction

Especially in recent years, local governments (LGs) across the world, and municipal governments in particular, have confronted varying degrees of financial distress mainly as consequence of severe economic crises. LG's financial distress is a complex and multidimensional process. The causes behind jurisdictions that fall into financial distress are varied, and no simple linear relationship exists. Falling revenues, central State and regional grant cuts, investment losses to pension funds, and growing cost pressure from social service programs have been responsible of financial difficulties up to even financial crises or emergencies. Running out of cash and facing liquidity crises or even bankruptcy have caused severe downturns in the provision of essential local public services and infrastructures and have affected local economies, as not paid providers might then go to bankruptcy themselves. For example, in 2013, official statistics by the Italian national central bank have highlighted that local public sector arrears accounted for about 5% of national GDP. For this reason, while only a few years ago, the interest on financial health assessment and the related probability of financial crisis was usually restricted to long-term loan admissions by banks, the recession has boosted the importance by the providers of local governments in their customers' selection and credit management strategies. Given the financial and economic instability of several countries, the growing trend of urban population and considering that LGs manage between one fifth and one third of public expenditure, financial health of LGs remains under the spotlight of practitioners and academics.

The following section briefly portrays the several facets of financial health and distress definitions in LGs; then we focus on measuring financial health to prevent fiscal distress and the related issues facing the accounting information structure in LGs; an international framework to assess and compare financial health of LGs is presented in the following section, while conclusions are presented at the end of this chapter.

## The Multifaceted Perspectives of Financial Health in LGs

Financial health, also known as financial condition, of local governments (LGs) mostly refers to its core notions of fiscal health and its related concept of fiscal stress, otherwise called fiscal distress or strain (Levine et al. 2013). Fiscal health refers to an LG's overall ability to maintain services that respond to an emergent situation. It emphasizes detecting indicators of fiscal health such as economic and population change, revenue and expenditures per person, and debt per person. For the American context, some authors have written that municipal governments' financial health is defined or determined by socioeconomic forces (Peterson 1976) or by the municipal bond market (Petersen 1974). In these definitions, financial health appears to be related to long-run solvency and service level solvency. On the other hand, fiscal distress is associated with the ability of an LG to meet short- and long-term financial obligations and avoid State takeover or municipal bankruptcy. Situations perceived by public officials to identify fiscal distress are (1) inability to meet payrolls when due and (2) default on repayment of bonded debt (Downing 1991: 323). This latter point of view has been predominant for some European authors, who have focused their research onto LGs' credit ratings and solvability assessment (e.g., López et al. 2003). Fiscal strain has also been defined considering its dynamic perspective of inability of adaptation to changing resources and problems confronting a municipality (Clark 1977: 55). Others have discriminated between the short-term perspective as the failure to meet payroll and to make payments in a timely manner and the long-term perspective as the incapacity to get a balance of LG's tax base relative to its expenditures and commitments (Kloha et al. 2005). In fiscal stress measures, there is a general emphasis on indicators such as fund balance, cash availability, deficits, and property value losses. In this context, it tends to be a correlation between cash and budgetary solvency and fiscal stress-type measures.

## Measuring Financial Health and Accounting in LGs

This wide array of options has determined a diversity of approaches to LGs' financial health assessment by audit bodies throughout the world (Padovani and Scorsone 2011). It is generally accepted that several measures can be used to assess LGs' financial health. These techniques range from basic approaches such as accounting information and financial reporting analysis eventually added of qualitative analysis by reviewing audit reports, LG's reporting process, or information gathered from discussions or regional workshops to more sophisticated statistical modeling approaches. An important aspect of these quantitative works is the proxy used in order to discriminate financially unhealthy LGs from the healthy ones. Several variables have been proposed for this purpose such as ratio indicators, the incidence of mergers or amalgamations, the quantity or quality of service delivery, and the cost of restoring infrastructure assets to satisfactory condition. In essence, the differences in the set of indicators used to assess financial health reflect the variances of sub-concepts in which it can be broken out.

The approach for measuring financial health is heavily affected by the accounting system in use. A typical LG's accounting system provides historical information about revenues and expenses. By contrast, budgetary accounting, which also is part of an LG's accounting system, refers to the upcoming fiscal year. Budgetary choices often are constrained by legal obligations to avoid financial distress, one of which, in many LGs, is that total expenses should not exceed total revenues. In general, although revenues and expenses should be accounted for on an accrual basis, many LGs use other accounting approaches. According to the most qualified definitions, public accounting can be grouped into four main systems:

- Cash accounting: it is a basis of accounting that recognizes transactions and other events only when cash is received or paid; it measures financial results for a period as the difference between cash receipts and cash payments; cash flow statements and cash balances are the most common documents.
- Modified cash accounting: it is a system that recognizes transactions and other events on a cash basis during the year, but it also takes into account the unpaid accounts and/or receivables at year's end since the books are held open for around a month after the end of the year.
- Modified accrual accounting: this system recognizes transactions and other events on an accrual basis, but certain classes of assets or liabilities are not recognized, e.g., the expensing of all nonfinancial assets at the time of purchase.
- Accrual accounting: it is a basis of accounting under which transactions and other events are recognized when they occur (and not only when cash or its equivalent is received or paid); therefore, the transactions and events are recorded in the accounting records and recognized in the financial statements of the periods to which they relate.

Accrual accounting generally is considered to be the preferred method for recording revenues and expenses and is used in almost all private sector organizations throughout the world. In recent years, it has been proposed for LGs in several countries. While the idea of accrual accounting has received considerable support from both practitioners and academics, most LGs are still a long way from using it, as the prevailing traditional accounting systems are cash or modified cash/modified accrual. These are not able to account properly for revenues when they were earned and expenses when they were incurred (regardless of when the corresponding cash inflows and cash outflows took place). As a result, LGs implementing these systems can only partially provide accurate financial information to either their citizens or their managers for financial health assessment.

It is not rare to have parallel systems where the accrual accounting system that should be *implemented* and *used* for decision-making is simply *implemented* in a formal way, as the accounting system(s) effectively *used* is (are) another

(others). Not only the competition among different types of accounting information is determinant, but also the quality of the information matters. This is made clear by studies which support that the quality of financial reports based on accrual accounting is determined by the demand of that kind of information. For example, in Europe, with the exceptions of the UK and some Nordic countries, municipal governments have introduced accrual accounting without being pushed by a factual market-oriented management style. Therefore the demand of high-quality data seems to be poor and so ought be the accrual information produced, originating a loop where accrual accounting information is poor, consequently it is not used for performance assessments nor for financial health evaluations. This ends up into the situation where traditional cash, modified cash/modified accrual systems remain pivotal in the provision of financial information to assess financial health of LGs.

Reporting of public finances, including LGs, is also at the cornerstone of two competing approaches to accounting:

- Government financial statistics, i.e., that accounting system whose aim is to represent economy at a whole and articulated in its subsectors
- Government financial reporting, whose foundational basis is entity accounts

The two approaches provide two separate paradigms where in the former instance the macroperspective – whole economy or one of its sectors – is more important, while in the latter the consistency of accounting is assured at the microlevel – i.e., each public sector organization. This creates differences in the accounting numbers provided and reflects the interests, stakes, and, above all, "languages" of two competing communities, respectively, that of national statistic offices and international governmental institutions (e.g., United Nations, International Monetary Fund, or Eurostat in EU) on one hand, and that of private actors, professional standard setters, professional accountancy bodies, and audit firms on the other. For the government financial statistics, various international standards that apply to LGs occur. The International Monetary Fund (IMF) has issued the third edition of its Government Finance Statistics Manual in 2014 which has the aim to provide a macroeconomic statistical framework, the Government Finance Statistics (GFS) framework, designed to support internationally standardized fiscal analysis of any level of government. Another example of government financial statistics at the international level that is potentially applicable to the city government level is the European System of Accounts (ESA) by Eurostat. This system is an internationally compatible accounting framework applied within the European Union for a systematic and detailed description of regional, country, or group of countries economies. As the IMF's GFS framework, this system is consistent with the worldwide guidelines on national accounting of the System of National Accounts 2008 by United Nations, but it considers some differences in the presentation of statistical information, including a higher degree of precision of elements considered of importance for the coordination of public finance at the EU level. For the government financial reporting approach, the International Public Sector Accounting Standard Board (IPSASB) has already provided a set of standards (IPSAS) that have been followed by several countries around the world. Recently, EU has decided to set its own accounting standards using IPSAS as basis to build the new European Public Sector Accounting Standards (EPSAS). IPSAS already includes some attempts of harmonization with statistical accounting approaches. Accrual accounting is at the core of these standards, and its adoption in government financial reporting has been considered one of the pillars of the New Public Management and an unquestionable goal for public sector organizations. While the level of maturity of IPSAS varies among LGs of different countries and implementation implies several efforts, most EU countries seem to be ready to implement a harmonized EPSAS system based on accrual accounting and with the aim to link government financial statistics with government financial reporting by the beginning of 2020s.

## Measuring Financial Health in LGs: An International Framework

In June 2014, the creation of the European City Economic and Financial Governance (CEFG) Group at the European Institute of Public Administration (EIPA), the leading center of European learning and development for the public sector, supported by the European Commission through the European Union budget, has made the first move toward an international framework for measuring financial health within EU. This agreement was signed between the city governments of Barcelona (Spain), Dublin (Ireland), Hamburg (Germany), City of London (UK), Milan (Italy), and Vienna (Austria), which represent a total accumulated population of just over 15 million (30 million including metropolitan areas). The CEFG's main goal is benchmarking and creating a space for mutual learning in the field of economic and financial governance and can be considered a unique international cooperation as usually LGs' fiscal and financial management issues are not treated from a cross-border perspective (more information at www.cefg.eu). The six cities provided a number of experts (13 directly involved and several indirectly involved participants) in the field of financial management of city governments with similar dimensions and belonging to metropolitan areas. They were selected so as to have different systems and levels of maturity of accounting, as well as different administrative traditions (see Table 1). Along a pathway of 18 months during which a series of meetings and exchange of information have been carried out, a common city financial report and financial health key performance indicators (KPIs), otherwise called "Financial Health Template," has been provided. The approach used within the CEFG group has been the convergence toward common solutions starting from the accounting information already available in each context. The validity of the approach used has been recently acknowledged by Eurostat's EPSAS Task Force (the task force working on the EU's member States accounting harmonization), by declaring a special linkage and alignment with their work.

The "Financial Health Template" is a set of accounting information, statements, and financial indicators (KPIs), which can be used for comparing the six cities. The statements, i.e., the structure of accounting information, are in line with frameworks and principles such as the European System of Accounts (ESA), the International Public Sector Accounting Standards (IPSAS), and the IMF's GFS approaches, based on accrual accounting. The CEFG group agreed that the main target public of the "Financial Health Template" is the main stakeholders of local government finances, i.e., citizens, politicians, media, and public and private institutions. Hence, it would need to be published, spread, and made accessible also for people with minimal accounting or financial mechanisms backgrounds.

The purpose of the accounting statements is to provide the multifaceted financial performance and situation, and it is composed of the following statements: operating performance, capital operations, financial flows, cash statements, and debt. These statements are linked to one another, as the elements used to compute the various relevant accounting information must balance to guarantee coherence of the accounting information used:

- The *operating performance* (OP) statement shows revenues and expenditures generated by current operations and their balance. City governments levy city taxes earn revenues from service fees and charges and receive higher-level governments' grants and shared revenues. These revenues are used to cover current expenditures, among which personnel costs and interests on debt. After these costs of doing their business are paid, the amount left over is called gross operating balance which, deducted of depreciation, is a net operating balance. In case of a positive net operating balance, this amount is available in future years to make future investments, while a negative net operating balance means that current taxpayers have received more than what they have paid. The distinction between net operating balance and gross operating balance is highlighted as some city governments do not account for depreciation.

**Financial Health and Distress in Local Government, Table 1** Composition of the CEFG group of city governments

| | Pop. (mln) | Administrative tradition | Accounting system implemented[a] | Accounting maturity[b] | Experts involved in the focus group (CEFG) |
|---|---|---|---|---|---|
| *Barcelona* (*Spain*) | 1,6 | French/ Napoleonic or German[a] | Accrual | High (68%) | CFO, Manager of Office of Management and Executive Budget, Comptroller General, Manager of Office of Finance, plus other experts within the same departments who participated directly and indirectly to some meetings |
| *Dublin* (*Ireland*) | 0,5 | Anglo-Saxon | Accrual | High (71%) | CFO, plus other experts within the same departments indirectly involved |
| *Hamburg* (*Germany)* | 1,8 | German | Combination of accrual and cash | Medium (58%) | CFO, Head of Budgeting Unit, Expert in Financial Accounting at Budgeting Unit |
| *City of London* (*United Kingdom*) | 8,4[c] | Anglo-Saxon | Accrual | Very high (95%) | CFO, plus other experts within the same departments indirectly involved |
| *Milan* (*Italy*) | 1,3 | French/ Napoleonic | Combination of accrual and cash | Low (30%) | CFO, Accounting Manager, plus other experts within the same departments indirectly involved |
| *Vienna* (*Austria*) | 1,7 | German | Accrual | Very low (12%) | CFO, plus other experts within the same departments indirectly involved |

[a]Accounting systems implemented according to Ernst and Young (2012)
[b]Accounting maturity as proximity to IPSAS principles according to PricewaterhouseCoopers (2014)
[c]For "City of London," we mean the City of London Corporation, the municipal governing body of the City of London, the historic center of London, and the location of much of the UK's financial sector (the "City"); the population portrayed in the table refers to the whole city of London as the number of residents is not significant and does not reflect the role of this city government

- The *capital operations* statement is composed of two subsections. The first section, the *capital financial flows* (CF) statement, give evidence of capital operations in terms of financial flows generated by disposal of fixed capital, capital grants from other entities, and other capital revenues and consumed for acquisition of fixed capital and grants to other entities. The difference between flows generation and consumption gives evidence to the balance in terms of capital financial capacity or need. The second subsection, the *capital creation or consumption* (CC) statement, gives evidence to the creation of fixed assets by considering the related financial flows (gross creation of fixed assets) eventually reduced by depreciation (net increase of fixed assets).
- The *financial flows* (FF) statement gives evidence to two main commonly used financial balances in public sector accounting, i.e., the net lending/borrowing (computed by adding to the capital financial capacity or need of the capital financial flows statement the gross operating balance) and the overall financial flows (the balance of all financial flows).
- The *cash and debt* report is composed of three subsections that give evidence to three important elements of the financial situation: *cash* (and its flows along the year) (CS), short-term (or *pending payments* – PP) and long-term (or *long-term debt* – LD) liabilities.

Each item of the four statements is accounted according to accrual accounting except those included in the capital financial flows (CF), where inflows and outflows are accounted when the credit or liability rises, and the cash statement (CS), where inflows and outflows are accounted in terms of cash accounting. Where appropriate, each item has a "specific definition" to help city

governments to fill in the specific financial item with the expected information. Considering the heterogeneity and the difficulty to find a minimum common denominator for the perimeter of analysis outside the legal entity of each city government and the limited availability of consolidated reports information, the financial information has been provided in relation to the legal perimeter of each city, thus not considering any external agency and city's or shared corporation.

These statements are supplemented by a set of agreed KPIs useful to assess the financial health comparatively. They are listed and described below:

- *Financial autonomy*: it answers the question "To what extent is the city independent from other governments?" and is computed by dividing the city's own revenue out of the total revenues.
- *Overall financial flows balance*: it answers the question "How big is the financial flows overall surplus or deficit?" It is computed by dividing the overall financial flows balance by the current revenues amount; in case it is positive, future generations will receive benefits from old generations, while in case it is negative, current generations receive back more from their payments.
- *Net lending or borrowing capacity*: it answers the question "How big is the surplus or deficit generated by the current and capital operations?" It is similar to the second KPI but excludes financial operations.
- *Operating balance*: it answers to the question "Is there a balance between current resources and structural expenditures?" and is computed by dividing current revenues out of current expenditures and debt repayment (principal) excluding extraordinary repayments. In case it is higher than 100%, new capital assets may be purchased in the future without incurring new loans, while below 100%, it shows a possible dangerous imbalance.
- *Cost of debt*: it shows how big the cost of debt is and how much it takes from the current economic capacity (current, operating revenues) of the city government. It is computed dividing the cost for interests and other costs associated to debt by current revenues; the lower the better.
- *Debt repayment capacity*: it answers the question "How big is the long-term debt compared to annual current revenues?". Similar to the European Maastricht's Stability Pact Debt/GDP ratio at the national level, it is computed by dividing the stock of debt at the end of the year by current revenues; the lower the better.
- *Debt repayment length*: it answers the question "How long does it take to repay the stock of debt at current level of repayment (in years)?" and it is computed by dividing the stock of debt at the end of the year by the debt repayment (principal, excluding extraordinary repayments) amount; the lower the better, since it means that the city has less dead weight for its financial future.
- *Debt pay-down capacity*: it gives evidence to the time to repay the stock of debt if all current surplus where used. It is computed by dividing the stock of debt at the end of the year by the current revenues; the lower the better.
- *Amount of commercial debts*: it approximates the length of payment by answering the question "Does the city demonstrate any difficulties in paying creditors?". It is computed by dividing the pending payments at the end of the year by the amount of current and capital expenditures; the lower the better.
- *Cash facility burden*: as an excessive use of cash facilities (e.g., overdrafts) may be a symptom of short-term solvency difficulties; this indicator is measured by dividing receipts from overdrafts and other cash facilities by current revenues; the lower the better.

Table 2 portrays the "Financial Health Template" for the city government of Barcelona (for other city governments, see www.cefg.eu).

The CEFG group has stressed the idea that even if this report structure claims to have defined a common set of financial information and KPIs as accurately and clearly as possible, the rules of central governments and their possible restrictions, e.g., obligation to break even or requirement of surpluses/prevention of these by politics, the

| OP16=OP9-OP13 | Gross Operating Balance | 427,8 | 467,6 | 631,5 | |
| OP17=OP9-OP15 | Net Operating Balance | 337,5 | 372,8 | 530,2 | |

CAPITAL OPERATIONS

These two reports give evidence of capital operations both in terms of financial flows generated, and their balance in terms of capital financial capacity or need, and assets created or consumed

CAPITAL FINANCIAL FLOWS (CF)

| code | item | 2012 | 2013 | 2014 | comments |
|---|---|---|---|---|---|
| CF1 | Disposal of Fixed Capital | 11,6 | 7,5 | 11,1 | |
| CF2 | Capital Grants from Other Entities | 14,0 | 20,2 | 42,8 | |
| CF3 | Other Capital Revenues | 0,0 | 0,0 | 0,0 | |
| CF4=CF1+CF2+CF3 | Capital Revenues | 25,6 | 27,7 | 53,9 | |
| CF5 | Acquisition of Fixed Capital | 375,0 | 325,8 | 495,0 | |
| CF6 | Capital Grants to Other Entities | 18,3 | 30,1 | 168,2 | |
| CF7=CF5+CF6 | Capital Expenditures | 393,3 | 355,9 | 663,3 | |
| CF8=CF4-CF7 | Capital Financial Capacity (+) or Need (-) | -367,7 | -328,2 | -609,3 | |

CAPITAL CREATION OR CONSUMPTION (CC)

| code | item | 2012 | 2013 | 2014 |
|---|---|---|---|---|
| CC1=CF5-CF1 | Gross Creation of Fixed Assets | 363,5 | 318,3 | 483,9 |
| CC2=CC1-OP14 | Net Increase of Fixed Assets | 273,2 | 223,5 | 382,6 |

FINANCIAL FLOWS (FF)

This report gives evidence to two main financial balances, i.e. the net lending/borrowing and the overall financial flows balance

| code | item | 2012 | 2013 | 2014 | comments |
|---|---|---|---|---|---|
| FF1=OP16-CF8 | Net Lending (+) or Borrowing (-) | 69,1 | 135,4 | 22,2 | |
| FF2 | Disposal of Financial Fixed Assets | 1,8 | 1,2 | 1,8 | |
| FF3 | Acquisition of Financial Fixed Assets | 1,3 | 1,3 | 1,2 | |
| FF4=FF1+FF2-FF3+LD2-LD3 | Overall Financial Flows Balance (Current Year) | 135,5 | 75,6 | -106,9 | |

CASH STATEMENT & DEBT

These three reports give evidence to three important elements of the financial situation: cash (and its flows along the year), and short and long term liabilities.

CASH STATEMENT (CS)

| code | item | 2012 | 2013 | 2014 | comments |
|---|---|---|---|---|---|
| CS1 | Cash as of January 1st | 270,0 | 381,4 | 519,1 | |
| CS2 | Receipts from Operations | 2.225,5 | 2.382,4 | 2.639,2 | |
| CS3 | Payments from Operations | 2.189,5 | 2.180,9 | 2.383,9 | |
| CS4=CS2-CS3 | Cash Flow Generated from Operations | 36,4 | 201,5 | 255,3 | |
| CS5 | Receipts from Overdrafts and Other Cash Facilities | 0,0 | 0,0 | 0,0 | |
| CS6 | Receipts from Other Financial Operations | 165,0 | 40,0 | 0,0 | |
| CS7 | Repayments of Overdrafts and Other Cash Facilities | 0,0 | 0,0 | 0,0 | |
| CS8 | Repayments of Other Financial Operations | 90,0 | 103,7 | 129,7 | |
| CS9=CS5-CS6-CS7-CS8 | Cash Flow Generated from Cash Facilities and Other Financial Operations | 75,0 | -63,7 | -129,7 | |
| CS10=CS4+CS9 | Total Cash Flow | 111,4 | 137,7 | 125,6 | |
| CS11=CS1+CS10 | Cash as of December 31st | 381,4 | 519,1 | 644,8 | |

PENDING PAYMENTS (PP)

| code | item | 2012 | 2013 | 2014 | comments |
|---|---|---|---|---|---|
| PP1 | Pending payments as of January 1st | 407,6 | 464,1 | 480,7 | |
| PP2 | Pending payments from Previous Years Paid or Cancelled | 395,7 | 452,8 | 462,5 | |
| PP3 | Pending payments from Current Year (Year End) | 452,8 | 469,4 | 614,3 | |
| PP4=PP1-PP2+PP3 | Pending payments as of December 31st | 464,1 | 480,7 | 632,5 | |

LONG TERM DEBT (LD)

| code | item | 2012 | 2013 | 2014 | comments |
|---|---|---|---|---|---|
| LD1 | Long Term Debt as of January 1st | 1.090,1 | 1.165,1 | 1.101,4 | |
| LD2 | New Long Term Debt | 165,0 | 40,0 | 0,0 | |
| LD3 | Debt Repayment (Principal) | 90,0 | 103,7 | 129,7 | |
| LD3A | *Debt Repayment (Principal) Excluding Extraordinary Repayments* | *90,0* | *103,7* | *129,7* | |
| LD4=LD1+LD2-LD3 | Debt as of December 31st | 1.165,1 | 1.101,4 | 971,7 | |

(continued)

diverse local socioeconomic situations or the different competences of the respective cities, do affect the cities and cannot always be adequately reflected in the respective indicators. For instance, operating performance indicators of the cities of Vienna and Hamburg triple those of Milan, the

**Financial Health and Distress in Local Government, Table 2** (continued)

| FINANCIAL HEALTH KPIs (FH) | | | | | |
|---|---|---|---|---|---|
| | code | KPI | 2012 | 2013 | 2014 |
| Autonomy | FH1=OP5/OP9 | **Financial Autonomy** - How much is the city independent from other governments? – usually, the higher the better – | 50,2% | 49,7% | 55,2% |
| Balance | FH2=FF4/OP9 | **Overall Financial Flows Balance** - How big is the financial flows overall surplus or deficit? – it should not be <0; in case it is positive, future generations will receive benefits from old generations – | 6,1% | 3,2% | -4,2% |
| | FH3=FF1/OP9 | **Net Lending or Borrowing Capacity** - How big is the surplus or deficit generated by the current and capital operations (similar to FH2, but excludes financial operations)? - - it should not be <0; in case it is positive, future generations will receive benefits from old generations | 2,7% | 5,9% | 0,9% |
| | FH4=OP9/(OP13+LD3A) | **Operating Balance** - Is there a balance between current resources and structural expenditures? – it should be >100% and in that case new capital assets can be purchased without incurring in new loans; <100% shows a dangerous imbalance – | 117,8% | 118,3% | 124,9% |
| Debt | FH5=OP10/OP9 | **Cost of Debt** - It shows how big is the cost of debt and how much takes from the current economic capacity (current, operating revenues) of the city government – the lower the better | 1,4% | 1,4% | 1,2% |
| | FH6=LD4/OP9 | **Debt Repayment Capacity** - How big is the long-term debt compared to annual current revenues? – like the Maastricht's Stability Pact Debt/GDP ratio | 52,1% | 46,7% | 38,6% |
| | FH7=LD4/LD3A | **Debt Repayment Length** - How long does it take to repay the stock of debt at current level of repayment (in years)? – the lower the better, since it means that the city has less dead weight for its financial future | 12,9 | 10,6 | 7,5 |
| | FH8=LD4/OP16 | **Debt Paydown Capacity** - How long does it take to repay the stock of debt if all current surplus where used? – the lower the better | 2,7 | 2,4 | 1,5 |
| Short Term Solvency | FH9=PP4/(OP13+CF7) | **Amount of Commercial Debts** - Does the city demonstrate any difficulties in paying creditors? – the lower the better – | 21% | 21% | 25% |
| | FH10=CS5/OP9 | **Cash Facility Burden** - An excessive use of cash facilities (e.g. overdrafts) may be a symptom of short term solvency difficulties – the lower the better | 0,0 | 0,0 | 0,0 |

Note: Full tables for all CEFG's city government are available at www.cefg.eu

third highest ranked city. This is, among others, due to the fact that Vienna and Hamburg are city-states with also regional competences, and thus they manage a bigger share of services and functions. In addition, both Vienna and Hamburg include pensions in their current expenditures, which is not the case in the other CEFG member cities. Another peculiarity and thus worth mentioning is the City of London, which has no long-term debt (which is a very unusual position for English local authorities) because of a high-value property portfolio in the city. Finally, the City of London has a different financial year compared to the other five partner cities.

## Conclusions

In the aftermath of the credit crisis and the recent great recession, LGs' financial health has been tested as major bankruptcies occurred and LGs faced major financial emergencies and crises across the world. While events have played out differently, the core problem that remains is the assessment of how LGs' fiscal health is measured, evaluated, and even predicted. Accounting systems, as the key tools in the measurement of LGs' finances, are crucial part of our understanding of fiscal health and distress. Not just one way of measuring financial health of LGs but several approaches compete each other, depending on administrative traditions and accounting systems implemented and actually used. This creates room for researchers and practitioners looking for standards and ways to visualize financial conditions that may be helpful to stakeholder and policymakers.

# Financial Inclusion in Latin America

Ignacio Esteban Carballo
Pontifical Catholic University of Argentina (UCA) and University of Buenos Aires (UBA). Magister by Autonomous University of Madrid (UAM). Doctoral scholarship holder at Center of Studies of the Economic Structure (CENES / FCE-UBA), Institute of Economic Research, CONICET, Buenos Aires, Argentina

## Synonyms

Access to financial markets; Financial services; Financial stability; Microfinance

## Definition

Financial inclusion is an ecosystem in which supply, demand, and the regulatory framework interact with the same degree of relevance. Therefore, a definition that considers all its complexity and multidimensionality is crucial. Broadly speaking, we can say that financial inclusion includes the establishment, the promotion, and the regulation of an accessible, affordable, and safe financial environment for the society as a whole. It aims at promoting economic well-being and social inclusion through the supply of financial services and products designed to satisfy the needs of different segments of society.

## Introduction

The significant contribution that financial inclusion can make to achieving inclusive economic growth and the Sustainable Development Goals has gained global recognition. This has in turn led to critical policy reforms that help establish an enabling environment to promote financial inclusion, for example, through specific financial inclusion commitments or National Financial Inclusion Strategies.

However, as will be discussed below, only 62% of the world's adult population has a bank account. This means two billion people are excluded from the formal financial system. To make matters worse, poor people and developing countries dominate this unbanked share.

The definition of financial inclusion has evolved over the years, and it is sometimes defined differently by different countries, bodies, or actors.

For example, the G20's Global Partnership for Financial Inclusion (GPFI) adopts a pragmatic view defining financial inclusion as: "A state in which all working age adults have effective access to the following financial services provided by formal institutions: credit, savings (defined broadly to include transaction accounts) payment, insurance and investments."

On the other hand, bodies such as the Consultative Group to Assist the Poor (CGAP) use a more theoretical, wide-ranging, and comprehensive definition of financial inclusion defining it as: "A state where both individuals and businesses have opportunities to *access*, and the *ability to use* a diverse range of *appropriate* financial services that are *responsibly* and *sustainably* provided by formal financial institutions."

Financial inclusion is a broad, multidimensional, and polysemic concept, constantly evolving, constructed, and discussed. Its multidimensional nature stems from the unavoidable need to consider various elements and variables in order to achieve its goals. Broadly speaking, we can say that financial inclusion includes the establishment, the promotion, and the regulation of an accessible, affordable, and safe financial environment for the society as a whole. It aims at promoting economic well-being and social inclusion through the supply of financial services and products designed to satisfy the needs of different segments of society.

It is thus an incomplete concept, whose development can be approached from different perspectives. As we shall now see, financial inclusion has gradually found its way into the international policy agenda. However, there is a long road ahead for the phenomenon of financial inclusion.

## The Road to Financial Inclusion

The late 2015 session of the United Nations General Assembly marked the end of the Millennium Development Goals (MDG), implemented in the year 2000 and replaced with the new 2030 Agenda, with 17 new Sustainable Development Goals (SDGs). Financial inclusion had a prominent role in this new agenda: the need for improved or universal access to financial services is mentioned in five of the new goals.

However, the long road traveled by financial inclusion did not begin with the SDG. In 2009, with the launch of the Alliance for Financial Inclusion (AFI), policymakers and regulators from 60 developing and emerging countries committed to making financial services available to millions of people living on less than US$2 a day. In the same year, Her Majesty Queen Máxima of the Netherlands was appointed as the UN Secretary-General's Special Advocate for Inclusive Finance for Development.

One year later Group of Twenty (G20) leaders in Seoul launched the GPFI, naming three implementing partners (AFI, CGAP, and the International Finance Corporation) to take forward their financial inclusion action plan. In 2011 the Maya Declaration (world's first commitment platform to set concrete financial inclusion targets) was adopted by AFI members meeting in Mexico. Also in 2011, as we will discuss later, the World Bank Group launched the first global analysis on demand for financial services.

The growing interest garnered by this phenomenon is the consequence of the greater understanding of the importance of financial inclusion for

economic and social development, coupled with a higher number of research works and a greater quantitative recognition of the degree of financial exclusion and its effects. One of the most discussed reasons for explaining financial exclusion is that market- or individual-related characteristics could lead to prohibitive high costs for access to financial services.

Earlier in time, microfinance (that has their roots in microcredit initiatives in Bangladesh and parts of Latin America in the mid-1970s) positioned itself as a critical tool to reduce the disparity of access to financial services for poor people excluded by the traditional financial system. The main reason behind the exclusion of the poor from the formal financial system is the erroneous idea that they are incapable of saving, repaying loans, or undertaking productive enterprises.

Microfinance was thus born as a methodological innovation aimed at offering different financial services to poor people or people lacking collateral. After almost half a century of evolution and development, this practice has produced important lessons as to how to foster effective financial inclusion, with a focus on the most vulnerable.

Some approaches see financial inclusion as an evolution of or an improvement upon the concept of microfinance, basically positing that its goals go beyond the fight against poverty, also considering the reduction of banking costs and risks, the growth of the formal economy, job creation, the effectiveness of monetary policies, and the stability of the financial system, among others.

For these reasons, we can assert that financial inclusion is currently a key goal and a component perceived as central for social inclusion and the empowerment of the most disadvantaged sectors.

## Financial Inclusion: Measurement, Status, and Impact

### Measuring Financial Inclusion

Measuring and assessing financial inclusion is particularly difficult for two reasons. The first is the lack of an absolute consensus regarding a single variable or measure appropriate for representing the whole inherent complexity of the definition of financial inclusion. The second is the fact that information has become available only recently (and, in a certain sense, to a limited degree).

As regards the first reason, the literature studies financial inclusion from a multidimensional perspective. Various approaches resort to creating mixed indicators comprising groups of variables in order to model different aspects of financial inclusion. The most commonly covered dimensions are those related to access to, use of, and depth of the financial system. More recently, the literature has included aspects such as barriers to access and the quality of the financial system (Beck et al. 2007; Sarma and Pais 2011; Dabla-Norris et al. 2015; Sarma 2016).

In terms of the traditional dimensions of use of and access to the financial system, the number of bank accounts and their associated movements, credit and debit cards, branches, and ATMs are commonly used as proxies. The depth of the financial system is usually measured through the ratio of credits or deposits to the GDP in a given economy.

As regards the second reason, until very recently there was no globally comparable information on financial inclusion. It is only since 2004, thanks to the Financial Access Survey (FAS) of the International Monetary Fund (IMF), that a broad database about financial inclusion is being developed through the concentration of supply data, that is, with information provided by institutions and regulatory entities. Since its launch, 189 economies have contributed to the FAS, which now contain more than 150 series on financial inclusion for the period 2004–2015.

Even more relevant and recent is the information focused on the demand side. No comparable data from the individuals' perspective were available until the World Bank launched its first Global Findex database, in 2011. Based on approximately 150,000 interviews with adults, representative at the national level and

chosen randomly, the Global Findex database presents data from 143 countries for 2 years (2011 and 2014) and collects information on 506 indicators from at least 1,000 people aged over 15 in each country (Demirgüç-Kunt et al. 2015).

Among its indicators, the main one corresponds to access, measuring the level of adults (older than 15 years) who have an account at a financial institution (such as a bank, credit union, cooperative, and microfinance institution) or through a mobile money provider. But it also provides comparable indicators showing how people around the world save, borrow, make payments, and manage risk.

Currently, the Global Findex is the most comprehensive tool available to measure progress in terms of financial inclusion and the only source of data for comparative analyses between countries at the international and the regional level. The descriptive analysis developed in this work is based mainly on its results, supplemented when necessary with data from the FAS. We will also study the four categories of financial products which are most commonly used by the literature: payment services, saving products, credit, and insurance.

## The Global Status of Financial Inclusion

Before 2011, little was known about the global scope of the financial system, including how many people had bank accounts, how they used them, and to what degree specific groups, such as women and the poor, were excluded. The last available information in the Global Findex database (2014) shows that the last few years have seen an explosive improvement in terms of global financial inclusion, but that much remains to be done.

According to these data, 62% of the world's adults reported having an account with a financial institution or a mobile money account, compared to a share of 51% in 2011. However, two billion adults (or 38% of the world's adult population) remain excluded from the financial system, with unmet needs, and their market potential continues to be unexplored.

If we analyze the total number of unbanked adults, only 11% live in high-income economies in general. Within the most vulnerable population (adults with a daily income of less than US$2) the share increases to 77%. In other words, three out of four poor people in the world lack a bank account.

Account ownership varies widely around the planet. For instance, in the high-income economies of the Organization for Economic Cooperation and Development (OECD), account ownership is virtually universal: 94% of adults reported having an account in 2014; in developing economies, on the other hand, the share is 54%. As reflected in Fig. 1, there are huge disparities between developing regions: South Asia and East Asia and the Pacific account for more than half (55%) of the unbanked population.

In South Asia, the number of individuals who lack access to a bank account is around 625 million and in East Asia and the Pacific 490 million. In fact, only three Asian economies (India, China, and Indonesia) host almost 40% of the unbanked in the world. China accounts for 12% of unbanked adults across the globe and Indonesia 6%, together are home to seven out of ten unbanked adults in East Asia and the Pacific. Sub-Saharan Africa accounts for 17% of the world total with about 350 million unbanked adults. India accounts for 21% of the world's unbanked and two-thirds of South Asia's.

As discussed above, account ownership varies not only between countries or regions but also based on categories such as family income and gender. Over half (54%) of the adults in the poorest 40% of the world's households lacked banking services in 2014. In turn, in the OECD's high-income economies, there were practically no gender gaps in terms of account ownership, while in developing economies the gap remained stable between 2011 and 2014: 9% points of difference between women and men.

Besides access, the paramount variable of financial inclusion, it is necessary to consider the use of financial services. Table 1 synthesizes the main results of the Global Findex 2014

**Financial Inclusion in Latin America, Fig. 1** Adults without an account by region (%) – 2014 (Source: Own calculations based on Global Findex database 2014)

according to the main categories of financial products.

## Impact of Financial Inclusion

As we stated above, financial inclusion is a multidimensional concept, a fact which makes it difficult to plot a single and clear map of causal relationships between financial inclusion and inclusive economic growth.

According to the theory, access to financial services in favorable conditions promotes smoother consumption patterns, better expenditure planning, the addressing of health-related risks, and investment not only in productive endeavors but also for the long term, such as in education. However, there is little research on the issue. A fundamental reason is related to the aforementioned limitations in terms of availability of national and global data.

Having said that, various authors have explored the benefits of financial inclusion. In general, most have analyzed specific dimensions based on cases and assessments of particular programs implemented around the world. Karlan and Morduch (2009), Cull et al. (2014), Beck (2015), Klapper et al. (2016), and Demirgüç-Kunt and Singer (2017) provide literature reviews about the empirical benefits of financial inclusion through different approaches.

For example, Klapper et al. (2016) summarize empirical evidence, pointing out how financial inclusion can help achieve the Sustainable Development Goals (SDGs). Based on the study cases under analysis, the authors posit that some goals could be pursued directly through financial inclusion (goals 1, 2, 3, 4, and 5), while in the case of others (namely, 6, 7, 8, 9, 10, and 16), even though there are no empirical studies with robust evidence in this regard, there are theoretical reasons to believe that financial inclusion could be a way to pursue them indirectly.

**Financial Inclusion in Latin America, Table 1** Usage of financial services – Global Findex 2014 (Source: Own elaboration based on Demirgüç-Kunt and Singer (2017))

| Financial product | Global Findex 2014 |
|---|---|
| Payment | Virtually all account holders (95%) in high-income OECD economies made or received at least one digital payment from or into their account while in developing countries only 62% of did so |
| | In developing economies, 59% of adults who reported receiving a wage payment, 91% from the sale of agricultural goods and 48% from a government transfer payment, did so in cash instead of into an account |
| | Similarly, of the 56% of adults in developing countries that made regular payments for utilities in 2014, almost 90% did so in cash |
| Saving | Over half (56%) of adults around the world saved or set aside money in the past year (54% of adults in developing economies) |
| | A quarter of adults (or almost half of savers) saved formally in the past year (at a bank or another type of financial institution) |
| | In developing countries, about half of savers use other ways than a formal financial institution (an informal savings clubs, a person outside the family, or saving in cash at home or in goods) |
| Credit | Less than half (42%) of all adults reported borrowing money in the past 12 months (excluding through the use of credit cards) |
| | In high-income OECD economies, a financial institution was the most frequently reported source of new loans. In all other regions, family and friends were the most common source of new loans |
| | Overall in developing economies, three times as many adults borrowed from family or friends than borrowed from a financial institution |
| Insurance | The 2014 Global Findex database does not collect data on the use of insurance |

Similarly, Demirgüç-Kunt and Singer (2017) carry out an analysis of empirical evidence differentiated by the financial product category. Exploring their findings based on more recent global

**Financial Inclusion in Latin America, Table 2** Financial inclusion evidence-based impact (Source: Own elaboration based on Demirgüç-Kunt and Singer (2017))

| Financial product | Evidence-based impact |
|---|---|
| Payment | Shifting cash payments into accounts increase their speed, reduce the associated incidence of crime, increase transparency, and also help people build a payments data history which can then be leveraged for better access to credit |
| | Incorporating payments data into credit files also helps financial institutions to better assess credit risks and thus minimize their nonperforming loan portfolio |
| | Shifting cash payments into accounts might be especially valuable for women, who benefit from the greater confidentiality and control. This may also have larger societal and development benefits |
| Saving | Formal savings advantages are safety from theft, mostly pay better interest revenue, and curb impulse spending (and therefore encourage better cash management) |
| | Strengthen women's economic empowerment by offering confidentiality and greater control over their savings |
| | Anyway, researches express uncertainty about the exact mechanisms that allow people to save more or better manage their funds with savings account |
| Credit | Borrowing from a formal financial institution might give better credit terms than from informal lenders |
| | Microcredit might increase household consumption expenditures, assets, labor supply, and children's school attendance, especially when microcredit was provided to women |
| | Anyway, randomized controlled trials for evaluating the impact of microcredit have drawn "modestly positive, but not transformative, effects" of microcredit as a development tool (Banerjee et al. 2015) |
| Insurance | The empirical evidence documents that individuals indeed adopt higher-risk, higher-return technology if provided access to formal agricultural insurance |
| | Evidence shows that it encourages farmers to move from low-return, low-risk crops to high-return, high-risk crops |
| | However, studies typically do not assess the welfare implications of the adoption of higher-return technology |

evidence, Table 2 summarizes what we currently know about the impact of financial inclusion.

## Financial Inclusion in Latin America: Status and Obstacles

### The Status of Financial Inclusion in Latin America

When we analyze the Latin America and the Caribbean region based on World Bank data, five aspects stand out.

(1) *Account ownership: outstanding progress, but half the region continues to lack access*

As of 2011, only 39% of the adults in the region had a bank account. By 2014, that share had increased to 51%. This means that, even though there was a significant decrease in the unbanked population in 2011–2014, half the people in the region continue to lack access.

Approximately 10% of the world's unbanked population (210 million people) live in this region. However, the region's level of account ownership is still below than that of developing countries overall, which went from 41% in 2011 to 54%, and below the aforementioned global average, which increased from 51 to 62%.

(2) *Payments: good usage of the accounts, but low among the poorest*

A noteworthy aspect is that of usage levels (whether people use their accounts and how). Approximately 62% of account holders in Latin America and the Caribbean use their accounts to make or receive payments (a share well above the average of 48% for the developing world). Likewise, about 55% of the employees in the region receive their wages in a bank account (compared to an average of 41% in the developing world).

This active account usage is based mainly on card payments. Approximately 40% of the adults of Latin America and the Caribbean have a debit card: more than in all developing regions, with the exception of East Asia and the Pacific. They are also more likely to use them: 54% of account holders use their debit card to make direct payments, compared to 25% on average in developing economies. The widespread use of debit cards is also reflected in the way in which adults in the region make cash withdrawals: 71% resort to ATM (the highest share, by far, in developing regions).

However, an analysis of the most vulnerable segments contradicts this aspect. Only 5.91% of the poorest population (the poorest 40% of households with an account) in the region have a high frequency of account usage (at least three times a month). Though some countries, such as Costa Rica, have noteworthy ratios (16.54%), no country in the region is particularly advanced in this regard.

(3) *Saving and credit: particularly weak and informal*

In spite of the strong use of accounts as a means to make and receive payments, Latin Americans are less likely than their counterparts to save using accounts in financial institutions. Even worse, a significant share resorts to informal financial services.

Only 25% of account holders in Latin America use formal saving methods, compared to 39% in developing economies overall, 42% in sub-Saharan Africa, and 50% in East Asia and the Pacific. The difference between the total number of adults who reported having saved (41%) and those who did so in a formal financial institution (14%) broadened by 11% in 2011–2014. That is, the gap went from 16 to 27%, which reflects a significant increase in informal savings.

Against this backdrop, only 33% of the population in the region reported receiving a loan in the previous year, but only 11% did so with a formal financial institution (and less than 7% in the lowest-income segment). This means that an alarming 22% of borrowers resort to informal financial institutions.

(4) *High heterogeneity between countries*

Five countries in the region account for 72% of the unbanked population (Mexico, 25%; Brazil, 23%; Colombia, 10%; Peru,

7%; and Argentina, 7%). We find economies whose progress has been below average (such as Nicaragua, Ecuador, or Haiti) and others in which it has been particularly significant, such as Panama, where account ownership went from 25 to 43%, or Argentina, where it went from 33 to 50%.

Specifically, countries that exceed the region's average of 51% account ownership are Jamaica (78.3%), Brazil (68.1%), Costa Rica (64.5%), Chile (63.2%), Venezuela (56.8%), and the Dominican Republic (54%). Below are Argentina (50.1%), Ecuador (46.2%), Uruguay (45.3%), and Panama (43.4%). The lowest levels are in Guatemala (40.8%), Bolivia (40.7%), Mexico (38.6%), Colombia (38.3%), El Salvador (34.6%), Honduras (30%), Peru (29%), Nicaragua (18.8%), and Haiti (17.5%).

Disparities also exist in the realm of saving and credit. For instance, countries such as Brazil and Chile present the highest account ownership ratios (68 and 63%, respectively), but their saving and borrowing ratios are very low (12 and 15%, respectively).

(5) *The increase in account ownership is mainly explained by the progress of the poorest*

At the regional level, 41% of the adults living in the poorest 40% of households have an account: an increase of 17 percentage points relative to 2011. Instead, the richest 60% increased their level of account holding by just 8% (reaching 58%). In countries such as Argentina and Peru, the number of account holders among the poorest households increased more than twice and thrice, respectively.

The countries with the highest levels of banking among the most vulnerable (poorest 40% of households) are Jamaica (69.5%), Costa Rica (61.3%), Brazil (58.4%), Chile (56.37%), and Puerto Rico (55.9%). They are followed by Venezuela (48%), Argentina (44.3%), the Dominican Republic (41.8%), Uruguay (34.9%), Ecuador (32.4%), and Panama (32.4%). The lowest levels are in Mexico (29.2%), Guatemala (27.1%), Bolivia (26.3%), El Salvador (24.4%), Colombia (24.4%), Honduras (19.7%), Peru (18.4%), Haiti (14.5%), and Nicaragua (8.4%).

A comprehensive understanding of the reasons behind these regional characteristics requires a deeper analysis of each country's peculiarities and public policies.

However, as regards the significant increase in the number of holders of accounts with financial institutions in the region, the consensus generally holds that the governments in Latin America had a key role to play (particularly in relation to the poorest households), through the opening of accounts and the electronic transfer of subsidies, pensions, and other social benefits.

The data reveal that, of the 13% of adults who receive government transfers in the region, 67% do so through an account. This is by far the greatest share in the developing world, where, on average, only 52% of government transfers are deposited in an account. Having said that, the aforementioned regional heterogeneity appears in cases such as that of Brazil, where 88% of the population receiving government transfers (15% of the adult population) do so directly in an account, though 88% of those withdraw all of the funds as soon as they are deposited, without making an effective use of the account.

An alternative analysis is done by Rojas-Suarez (2016) comparing values from 2011 and 2014 with countries that the author calls "comparators" in the sense of having a similar degree of development as Latin America (group of countries in the world belonging to the same decile of GDP per capita). Beyond the regional amazing progress mentioned above, from this alternative perspective the region lags behind not only with respect to high-income countries but also with respect to the comparators.

Relative to its comparators, Latin America's account ownership in formal financial institutions gap (defined as the difference between Latin America's median value and the corresponding value for alternative country groupings) in 2011 and 2014 has not decreased significantly. Indeed, the reduction was only 0.7%. Measured by savings, Latin America's median gap has deteriorated relative to high-income countries by 3%, while it

has improved relative to its comparators by only 1%. Finally, says Rojas-Suarez, the borrowing variable yields the worst results where the regional median gap has deteriorated with respect to both high-income countries and Latin America's comparators.

In summary, the weakest points in Latin America in terms of financial inclusion refer to the fact that half the population remains unbanked and that usage measures continue to be weak.

### Obstacles to Financial Inclusion in Latin America

The data show that the greatest challenge for the future of financial inclusion in the region lies not only in providing the high number of unbanked people with access but also in ensuring that they (as well as those who already have access) make an effective use of the new tools.

Seeing financial inclusion as an ecosystem in which supply, demand, and the regulatory framework interact with the same degree of relevance, the barriers to the use and provision of financial services are multidimensional and comprise factors in the three dimensions. The literature has shown that both aggregate (macroeconomic) and individual (age, educational level, income, employment, etc.) variables are fundamental to explain ownership and use of accounts in the formal financial system (Allen et al. 2016).

For the specific case of Latin America, some authors suggest that the social, economic, and institutional environment in which financial markets operate has a key role to play in promoting or hindering their inclusive development. Specifically, Rojas-Suarez and Amado (2014) and Rojas-Suarez (2016) propose four categories of obstacles: socioeconomic constraints, macroeconomic environment, institutional weaknesses and inefficiencies, and inadequacies in the financial sector.

Their econometric analysis makes it possible for them to posit that, even though they differ in terms of significance, all categories are statistically relevant to explain the limited level of financial service use in Latin America. Table 3 below explains the different obstacles and presents evidence-based correlations for each.

**Financial Inclusion in Latin America, Table 3** Obstacles to financial inclusion in Latin America (Source: Own elaboration based on Rojas-Suarez and Amado (2014) and Rojas-Suarez (2016))

| Obstacles | Definitions and correlations |
|---|---|
| Socioeconomic | Theory: Countries with greater access to social services and a better quality of life are countries that have also developed a stronger "financial culture" in which the use of financial services through formal markets becomes essential |
| | Correlations: The correlation between alternative financial inclusion variables (accounts ownership, payments, savings, and borrowing) and the UN Human Development Indicator (a well-known measure of social development) is positive and high |
| Macroeconomic | Theory: Macroeconomic instabilities leading to financial crises drastically reduce the provision of credit and other financial services. On the demand side, it plays a central role in determining people's willingness to entrust their funds to the formal financial sector |
| | Correlations: In several countries, the correlation between alternative financial inclusion variables and real interest rate volatility (approximated by the coefficient of variation) is significant and negative |
| Institutional | Theory: The quality of institutions (broadly defined as the set of rules and conventions) has long been recognized as an important factor affecting access to and use of all type of financial services |
| | Correlations: The Worldwide Governance Indicator "Rule of Law" (that measures agents' confidence in and commitment to abiding by the rules of society, the quality of contract enforcement, the police, the courts, and the likelihood of crime and violence) shows a strong and statistically significant inverse relationship between weak law and all the financial inclusion variables |

(continued)

## Present and Future Trends of Financial Inclusion in Latin America

As we have seen so far, there is room to improve financial inclusion in the region. We will now

**Financial Inclusion in Latin America, Table 3** (continued)

| Obstacles | Definitions and correlations |
|---|---|
| Financial sector | Theory: One of the most discussed obstacles for explaining financial exclusion is that market characteristics could lead to prohibitive high costs for access to financial services (e.g., operational inefficiencies, concentration, etc.) |
| | Correlations: The relationship between financial inclusion variables and the ratio of bank's overhead costs to total assets (a common indicator of bank's operational efficiency) is negative and significant. In turn, the data does not show a significant correlation between financial concentration and financial inclusion. Particular correlations support the hypothesis that bank concentration is negatively associated with financial inclusion mostly in countries with weak institutional quality |

address three trends which will surely define the current and future agenda of financial inclusion in Latin America. As we shall see, these are far from being isolated phenomena. Rather, they present interlinked challenges and opportunities, which render them equally relevant.

## Growing Importance of Digital Financial Inclusion

One of the main pillars of the various efforts to promote financial inclusion around the world focuses on the promotion and adoption of new digital tools. Given the rapid advance of new technologies, digital innovations bring the promise of a broad-scope, large-scale financial inclusion. The use of digital means, particularly for payments but also for more complex forms of access to and use of financial services, has shown great potential in terms of reaching large segments of the financially excluded population (Chishti and Barberis 2016; Gabor and Brooks 2017).

Indeed, in order to manage not only the opportunities but also the risks associated with rapid digitalization, the G20 published in 2016 a report sponsored by the World Bank Group and the People's Bank of China (called "High-Level Principles for Digital Financial Inclusion") with eight recommendations to promote financial inclusion using digital technologies. More recently, during the German presidency of the G20 in 2017, the opportunities and risks associated with digital transformation applied to finance and its inclusive potential were also addressed.

Digital financial inclusion and the revolution of new financial technologies (Fintechs) are the current paradigm in the sector, and this also includes Latin America. In a region characterized by its geographical extension and high infrastructure costs, the trend in terms of mobile phone subscribers and Internet users shows promise.

According to data from the IMF's FAS (2015), mobile phone subscriptions in the region account for 115% of the population, while the number of Internet users amounts to 47%. Moreover, the number of ATM and bank branches, on average, is of only 49 and 39, respectively, for every 100,000 inhabitants. The report "Informe de Mobile Banking en América del sur y el mundo" (mobile banking in South America and the World), presented by TBI Unit in December, 2016, revealed that most banks in Latin America are already allowing and encouraging their customers to carry out mobile banking transactions, through applications, interactive mobile sites, or SMS.

Against this backdrop, many e-money projects have developed rapidly in the region during recent years, for example, in 2010, "Tcho Tcho" in Haiti, "mPeso" in Nicaragua, "Tigo Money" in Paraguay, and "Cuenta Móvil" in Chile; in 2011, "Daviplata" in Colombia, "Movilway e-wallet" in Venezuela, and "Bancamigo" and "Tigo Money" in Guatemala; in 2012, "Mi Billetera Móvil" in Argentina, "Billetera Móvil" in Perú, "transfer" in México, and "Transfer and Aval" in Colombia; during 2013, "Ahorro a la Mano" in Colombia, "Meu Dinheiro" and "Zuum" in Brazil, "Envíos Personal" in Paraguay, and "Lajancasjh" in Haiti; in 2014, "Orange mPeso" in the Dominican Republic, "Movil Cash" in Panama, "Tu Dinero Móvil" in Peru, and "y Plata Móvil" in Colombia; and during 2015 "Olhan Conta" and

"TIM Multibank Caixa" in Brazil, "Dinero Electrónico" in Ecuador, "Bim" in Peru, and "VIVA solutions" in Bolivia. The list can continue to this day.

Besides these efforts, according to the GSMA Mobile Money Adoption Survey (2015), of the 460 million adults in the region, only 15 million were registered users of electronic money, and only six million were active users. In other words, the penetration of electronic money was of only 3.3%. Besides, the range of uses was very limited: mobile balance top-up and people-to-people (P2P) operations accounted for 70% of all transactions.

Global Findex data show that the percentage of adults with a mobile account in Latin America is only 2% and that only 7% of the adults in the region report having used Internet to make payments, and only 7% of bank account holders carried out transactions through a mobile phone. According to the Americas Alternative Finance Industry Report (2017) of the Cambridge Centre for Alternative Finance, while the level of loans granted by banking institutions accounts for 41% of the regional GDP, financing through online platforms accounts for only 0.01%.

These figures suggest that innovative digital financial services have an enormous potential as a means to close the financial inclusion gap in Latin America, especially in countries in which the financial system has a reduced capillarity.

### Demand-Side Policies

The goal of designing policies to strengthen all dimensions of financial inclusion has led to a series of novel approaches aimed at providing new demand-side answers. Advances in the realm of behavioral economics have confirmed that psychological predisposition has an important effect on the behavior of savers, their personal finance, and their wealth (De Meza et al. 2008; Garcia 2013).

The various lessons this discipline brings to the discussion of financial inclusion have provided strong evidence of how the complexity of financial decisions often drives people away from efficient and optimal choices. For instance, it was found that people with prejudices toward financial topics are more likely to acquire financial products which are less favorable or which fail to meet their needs.

These lessons become especially relevant when designing tailored products or intervention strategies aimed at boosting financial capabilities in order to enable better decision-making. For instance, they have been useful inputs in financial education programs, which as a result considered the psychological advantages of factors such as the continuous nature of education, the use of easy-to-understand slogans, a reduced number of options for questions, the provision of tailored advice instead of passive education, and adjusting assistance to age or specific moments of the life cycle, among many others.

Financial education is a vital and essential capability, seen worldwide as a necessary condition to achieve real financial inclusion and, consequently, a sustainable economic development, with equal opportunities. In the words of the OECD, financial education sets the minimum foundations for many important decisions faced by all citizens during their lives, either when evaluating a work contract, buying their first home, or, later on, managing their retirement savings (García et al. 2013).

Most governments in Latin America recognize the importance of financial education, and many have implemented or are developing national financial education strategies. Some assessments are already showing positive outcomes, but measuring the program's impact and establishing comprehensive follow-up indicators, which go beyond the number of people educated, continue to be challenging.

Financial education is thus a fundamental tool to increase knowledge of financial products through information and advice, with the goal of developing the capabilities and trust needed to make informed and efficient decisions. It is fundamental as a means to manage the opportunities and risks of the digitalization which has made financial services available to a large share of the population. Demand-side policies aimed at increasing and improving the use of financial services in the region become thus unavoidable.

Empirical evidence has shown that financial inclusion makes it possible to increase well-being, when users have an appropriate level of knowledge and capabilities as regards financial products and services. The future of financial inclusion in Latin America must necessarily consider the need to work on the agents demanding financial services.

### Deepening Strategic Alliances

The current situation leads us to confirm that the smooth articulation of actors is a necessary condition to advance with well-targeted efforts. In this regard, the Alliance for Financial Inclusion (AFI) has played a key role, becoming a pioneer and benchmark in the area, for example, promoting National Strategy for Financial Inclusion or initiatives as the launch of the Financial Inclusion Initiative for Latin America and the Caribbean (FILAC) in strategic alliance with the International Development Research Centre (IDRC) in June 2016.

However, other alliances have achieved important outcomes, though without the AFI's global and massive scale. As another example of coordinated work in Latin America, we can mention the effort of the Inter-American Development Bank (IADB), which joined a strategic alliance organized by the UN to create synergies with governments, companies, and local organizations in order to promote Fintech-type innovations for financial digitalization.

We can highlight other important initiatives at the national level, for example, "Micropagos" of Banco Santander in Uruguay, an entity that has created an ecosystem composed of the same bank, mobile operators, and the company of mobile payment transactions "Micropagos" for the development of rural savings; the "Tigo Money" network in Honduras, which in alliance with banks and cooperatives, facilitates the sending of remittances and payments through mobile phone in 160 municipalities with low or zero banking; the "Viva Cash" mobile wallet in Bolivia, which uses the network of the largest distribution company in the country Viva and in partnership with different banks and provides services to the unbanked population in urban and rural areas; or the alliance between IDB-MIF and the telecommunications company Tigo in Paraguay that has allowed more than one million citizens to use their mobile phones to pay services, do transfers, access cash, and make deposits in an efficient and secure manner through a network of merchants throughout the country.

A particular case of digital financial innovation enabled through strategic alliances in the region is that of the digital money wallet Bim, in Peru, where, after exploring various schemes against the background of a new regulation on electronic money, the "Peru Model" was implemented in 2014 as a joint e-money project. Through it, the participants cooperated to create a common operational platform in order to develop an ecosystem of digital payments and then compete for the final users.

Later, 2015 saw the creation of Pagos Digitales Peruanos S.A., a company responsible for the implementation of Bim, a free-to-use digital money wallet which offers a solution which is unique and innovative compared to other models at the international level. Though Bim wallets are available to the general population, the program targets those sectors excluded from the financial system (according to the World Bank, only 30% of the Peruvian population has a savings account in a financial institution). That is why its design presents inclusive features, such as minimum entry requirements for users, a broad range of uses, and a high degree of interoperability.

The aforementioned examples show that alliances comprising different actors (public and private, local and international) and with technology as a fundamental ally make an important difference in terms of increasing and improving financial inclusion in Latin America.

## Conclusion

This entry has provided an overview of financial inclusion in the particular case of Latin America. Access to formal financial services enables individuals to carry out financial transactions more efficiently and safely and could help people escape poverty through investments in education

and businesses. Moreover, financial inclusion could also keep individuals from becoming poor in the first place, as it provides tools to manage income volatility.

At the macroeconomic level, the promise of reducing poverty and inequality is coupled with several potential benefits, such as the expansion of the formal economy, the reduction of banking risks and costs, job creation, financial stability, the effectiveness of monetary policies, and the stimulus for economic activity, among many others.

Having said that, two billion people in the world remain without access to an account in a financial institution, 10% of whom live in Latin America. In spite of the region's dynamism, half the adult population lacks access to an account. Including the 210 million Latin Americans currently excluded from the formal financial system will need additional efforts.

Some challenges remain, such as that of reducing the gap in account ownership between men and women and that between the wealthiest 60% and the poorest 40% of the population. It is central to improve usage indicators, and there is a significant potential to increase the share of adults who save and receive credit from formal institutions.

The obstacles to the improvement of financial inclusion in Latin America are many, and they refer to aspects of the social, economic, and institutional environment. Given its geography and the particularly high penetration of mobile phones and Internet users, new financial technologies emerge as a great opportunity for new providers to promote digital financial inclusion in the region.

It is central to leverage these experiences in order to identify goods practices to be replicated in different communities and sectors, as is the joint and coordinated work through strategic alliances. Besides, the use of mobile phones and the Internet to access financial services requires a balanced regulatory framework, which encourages both innovation and user protection. It is then fundamental to promote cooperation under a management model that promotes demand-side policies and includes frequent dialogue and coordination within each country.

In summary, financial education and literacy programs supporting the development of the industry, which consider the demand's aspects and capabilities, new technologies to facilitate a digitally responsible financial inclusion, and the valuable intervention of external actors working in alliances with local agents and leaders, are all critical factors which must work to create synergies in Latin American financial inclusion strategies.

# Financial Inclusion Policies and Supply of Domestic Credit to Private Sector

Suwastika Naidu and Yashnita Naicker
The University of the South Pacific,
Suva, Fiji Islands

## Synonyms

Financial inclusion policies; Ineffectiveness; National Financial Inclusion Strategic Plan; Private sector

## Definitions

Financial Inclusion Policies: are policies that ensure that all cohorts of the society are able to effectively and efficiently contribute toward economic and financial development of the nation.

National Financial Inclusion Strategic Plan: includes plans, strategies, and actions undertaken by the government to enhance the level of financial inclusiveness that exists in a society.

F

## Introduction

Private sector is a segment of the nation that is owned, organized, and managed by private individuals or enterprises (Lienert 2009). Considering the importance of the private sector to the economic growth rate, it is essential for the government to create an enabling business environment that will enhance savings, investment, and availability of domestic credit to private sector. A fundamental element of private sector development is access to finance. Facilitating favorable financial environment in terms of access to finance would assist in enhancing the private sector growth and development (European Commission 2017). The main aim of this policy paper is to examine the existing financial inclusion policies that affect domestic credit to private sector, identify problems that affect the domestic supply of credit to private sector, and provide policy prescriptions that would help to improve the existing constraints that restrict the domestic credit to private sector.

## Problem Statement

The domestic credit supplied to private sector is insufficient to meet the demand of domestic credit by the private sector in Fiji. The total government domestic debt has increased from $876.1 million in the year 1992 to $3195.7 million in the year 2016 (Reserve Bank of Fiji 2016b). This increment in the total government domestic debt shows that the government is borrowing at the expense of the private sector (see Fig. 1).

Currently, the type of credit products provided by the banks and nonbank financial institutions is mainly tailored toward the needs of the wealthy businesses and households, thus isolating the needs of the poor households and small businesses (see Fig. 2). Figure 2 shows that commercial bank's lending is increasing; however, this increase is not sufficient enough to meet domestic demand.

Source: Reserve Bank of Fiji, (2016b)

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Fig. 1** Government domestic debt ($ million). (Source: Reserve Bank of Fiji 2016b)

Without improving the accessibility of the financial services to private sector and enabling a savings culture, it would be difficult to reduce the interest rate on loans and increase the availability of domestic credit to private sector. Some key financial inclusion statistics shows that the accessibility of the Fiji citizens to the key financial services is relatively low. These key financial inclusion indicators are as follows:

I. **Accessibility of the Automated Teller Machines (ATMs)**: The accessibility of the ATMs increased from 36.53 per 100,000 adults in the year 2012 to 45.93 per 100,000 adults in the year 2015 (IMF 2016). Ease of access of ATMs motivates savers to bank their money with the banks and withdraw this savings when it is needed. Each dollar of money banked by the households has a multiplier effect on the ability of the banks to lend to the private sector. What improvements in the National Financial Inclusion Strategic Plan 2016–2020 are needed to help

Source: Reserve Bank of Fiji, (2016b)

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Fig. 2** Commercial bank lending to specific private sectors. (Source: Reserve Bank of Fiji 2016b)

to improve the accessibility of the ATM's to the citizens of Fiji?

II. **Number of Commercial Banks**: The number of commercial banks per 100,000 adults increased from 10.46 in the year 2012 to 12.27 in the year 2015 (IMF 2016). Many citizens living in the rural areas of Fiji have limited access to commercial banks. It may not be feasible for a poor farmer living in interior village of Rakiraki to pay $5 of bus fare to travel to Rakiraki town to bank $10. In this situation the depositor is well-off by not depositing the $10. What improvements in the National Financial Inclusion Strategic Plan 2016–2020 are needed to help to improve the accessibility of the banks to the citizens of Fiji?

III. **Mobile Money Agent Outlets**: Mobile money agent's outlets in Fiji increased from 374.52 per 100,000 adults in the year 2014 to 56.79 in the year 2015 (IMF 2016). With the increased use and acceptance of mobile technology in Fiji, it would be excellent to use mobiles as a mechanism to improve the accessibility of credit to the banking system in Fiji. What improvements in the National Financial Inclusion Strategic Plan 2016–2020 are needed to help to improve the level of financial inclusion in Fiji?

IV. **Loan Accounts with Commercial Banks per 1000 Adults**: The loan accounts with commercial banks per 1000 adults increased from 125.57 in the year 2012 to 177.94 in the year 2014. Currently, the loan product that is offered by the banks and the nonbank financial institutions is mainly for high-income earners and citizens who have the strong ability to pay. The poor are always excluded from the financial system because they do not have the means of getting the credit. Stringent regulations from the banks and nonbank financial institutions restrict the poor households from acquiring credit. How can the National Financial Inclusion Strategic Plan 2016–2020 framework be improved so that poor are also able to access the credit provided by the banks and nonbank financial institutions?

## Grounding Theory and Literature with the Problem Statement

The ability of households and businesses to secure finance acts as a lynchpin of national economic growth. Understanding the demand and supply side of credit constraints is a complex phenomenon that needs thorough understanding of the supply side factors affecting the financial institutions in providing credit and demand side factors constraining the households from getting credit. There are four important theories that have been developed since the year (1966) to explain the supply and demand side credit constraints faced by the households and financial institutions. These four theories are Franco Modigliani's Life Cycle Model (1966) (The life cycle model proposed that the decision of the household, whether to consume or to save, is determined by a number of factors. These factors mainly are factors that affect the equal distribution of the income of the household over the entire lifetime (Modigliani 1966).), Milton Friedman's Permanent Income Hypothesis (1957) (This theory emphasized that changes in the temporary income of the household do not have an impact on the consumption patterns of the household, whereas changes in the permanent income have an impact on the household's consumption patterns.), Meyers Pecking Order Theory (1984) (This theory proposes that companies rank their financing sources from the most desirable source to the least desirable source of finance. The most desirable source of finance is retained earnings followed by debt and equity.), and Bernanke and Gertler's Credit Channel Theory (1995) (According to this theory, the changes in the monetary policy affect the balance sheet of the businesses, therefore affecting the demand, supply, and cost of credit.). Table 1 summarizes how these theories are related to the life cycle model.

Moreover, there are a number of studies conducted in the small island developing countries on the reasons why the domestic credit supplied to the private sector is insufficient to meet the demand of domestic credit by the private sector. Hinton and Earnest (2010) argued that limited access to collateral by women limits

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Table 1** Relationship of the theories to the problem statement

| Theories | Relationship with problem statement |
|---|---|
| Franco Modigliani's Life Cycle Model (1966) | Income has an effect on credit constraint |
| Milton Friedman's Permanent Income Hypothesis (1957) | Permanent and temporary income has an effect on credit constraint |
| Meyers Pecking Order Theory (1984) | Interest rate has an effect on credit constraint |
| Bernanke and Gertler's Credit Channel Theory (1995) | Monetary policy has an impact on credit constraint |

them from getting credit from banks. Kasseeah and Tandrayen-Ragoobur (2011) found that working capital, size of the business, and age are three important credit constraints that affect the ability of the small business in getting credit from banks and nonbank financial institution in Mauritius. Kasseeah and Thoplan (2012) found that access to finance affects the ability of the small businesses to grow in Mauritius. Duncan et al. (2012) found that access to credit is limited in Fiji and Kiribati. Rashid's (2011) study on the 18 developing countries found that foreign bank presence in the domestic sector reduces domestic banks share of deposit charged to the private sector while acquiring loans from commercial banks. Sharma and Gounder's (2011) study on Fiji depicts that suppliers are concentrating on selected group of lending to the private sector where small businesses and poor households are left out. Craigwell and Kaidou-Jeffrey (2012) found that in a credit-rationed regime, banks try to reduce domestic credit to private sector. Sharma and Gounder (2012) found that deposit and asset growth affects the lending by the banks in the six Pacific Island Countries. Premaratne and Kudaliyanage (2016) found that women find it difficult to provide collateral to access credit in Maldives.

The Asian Development Bank (2013) report outlines access to financial services and stringent lending regulations limiting private sector investment in Fiji.

## Research Methods Used to Collect Data on the Problem Statement

The data for this policy paper was collected in two phases. In the first phase, we collected the secondary data, and in the second phase, we collected the primary data. To collect primary data, we had distributed 50 questionnaires to households and 50 questionnaires to small businesses in Fiji. Initially, we managed to collect only 48 questionnaires from households and 45 from small businesses. For comparison reasons, we again distributed 4 questionnaires to households and 7 to small businesses, and we managed to collect enough questionnaires to meet the benchmark of 50 questionnaires for households and small businesses, respectively. Data collected from this study was analyzed by using the EViews 8 and Statistical Package for Social Science (SPSS) software.

## Data Analysis and Discussions on the Problem Statement

### Demand Side Constraints

#### High Interest Rate and Fee Charges

High interest rates, fees, and charges constrain both the private individuals and small businesses in getting loan from banks and nonbank financial institutions. The mean value was 1.03 for small businesses and 1.4091 for households (see Tables 2 and 3). Additionally, the overall cost charged to the private households in managing their accounts has a negative and statistically significant effect on domestic credit to private individuals ($\beta = -0.225; p < 0.05$) (see Table 2A). There are a number of households in Fiji who want to take loan but are not able to because of the high interest rate, fees, and charges charged on small business loans.

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Table 2** Factors affecting domestic credit to small business

| Factors | Mean ($\bar{x}$) |
|---|---|
| High interest rate and fee charges | 1.03 |
| Collateral issues and lack of guarantee | 1.19 |
| High deposit or equity requirements | 1.23 |
| Lot of documentation and paper requirements | 1.08 |
| Low income | 0.03 |

1, very high impact; 5, very low impact

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Table 3** Factors affecting domestic credit to households

| Factors | Mean ($\bar{x}$) |
|---|---|
| High interest rate | 1.4091 |
| Collateral issues and fee charges | 1.5909 |
| High deposit or equity requirements | 1.3864 |
| Lot of documentation | 1.6591 |
| Low income | 1.4318 |

1, very high impact; 5, very low impact

### Collateral Issues and Lack of Guarantee

Collateral issues and lack of guarantee constrain both the private individuals and small businesses in getting loans from banks and nonbank financial institutions. The mean value was 1.19 for small businesses and 1.5909 for households (see Tables 2 and 3). There are many households and businesses in Fiji who want to take loan but are not able to because they are not able to meet the collateral and guarantee requirements of the bank.

### High Deposit and Equity Requirements

High deposit and equity requirements by the banks and nonbank financial institutions constrain both the private individuals and small businesses in getting loans. The mean value was 1.23 for small businesses and 1.39 for households (see Tables 2 and 3). The deposit requirements for private individual household credit are around 20% to 30% of the total loan amount.

### Lot of Documentations and Paper Requirements

High deposit and equity requirement by the banks and nonbank financial institutions constrain both the private individuals and small businesses in getting loans. The mean value was 1.23 for small businesses and 1.66 for households (see Tables 2 and 3). There are around 10 to 15 documents required to approve the loan for private individuals, and 15 to 20 documents are required for small business loans.

### Low Income and Education

High deposit and equity requirement by the banks and nonbank financial institutions constrain both the private individuals and small businesses in getting loans. The mean value was 1.23 for small businesses and 1.39 for households (see Tables 2 and 3). Education ($\beta = 0.376$; $p < 0.05$) and income ($\beta = 0.152$; $p < 0.05$) are positively and statistically significantly related to the ability of the households in getting loan (see Table 1A).

## Supply Side Constraints

### Claims on Other Sectors of the Domestic Economy as % of GDP (COSGDP)

COSGDP refers to the gross credit that is given by the financial system to the national economy (includes both the government and private sector) (World Bank 2017). A 1% increase in COSGDP increases domestic credit to private sector as a percentage of GDP by 0.96%, ceteris paribus ($p < 0.05$) (see Table 3A). Credit to the non-private sector is deposited in the financial institutions that act as credit to the private sector. The greater the supply of savings to the financial sector, the greater is the ability of the financial sector to make loans to the private sector.

### Claims on Central Government (% of GDP)

Claims on central bank as a % of GDP include the credit that is provided to the government institutions ($p < 0.05$) (World Bank 2017). A 1% increase in claims on central government increases domestic credit to private sector

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Table 4** Reasons for the loan to be rejected to businesses

| Factors | (%) |
|---|---|
| Low income and lack of collateral | 53.33 |
| Not enough deposit | 46.66 |

by financial institutions as a percentage of GDP by 3.12%, ceteris paribus (see Table 4A). An increase in the credit to central government institutions will increase money supply and reduce interest rate therefore a decrease in interest rate will increase the demand of the loan from the private sector.

Commercial Bank Branches (per 100,000 Adults)
A 1% increase in the number of commercial banks (per 100,000 adults) increases domestic credit to private sector as a percentage of GDP by 7.97%, ceteris paribus (see Table 4A). An increase in the number of commercial bank branches will increase domestic credit to private sector as the accessibility of financial system in Fiji will improve. However, the economic viability of this approach has to be investigated over increasing accessibility via mobile banking in Fiji.

### Why Is the Loan Rejected by the Banks?

There are a number of reasons why the loan is usually rejected to businesses and households. Out of the 18 businesses who tried to take loans from our of sample of 50 businesses, 53.33% stated that their loan was rejected because of low income and lack of collateral, and 46.66% stated that their loan was rejected because of not enough deposit (Table 4).

Out of the 36 households who tried to take loan from banks from the sample, 41.7% stated that their loan was rejected due to low income and lack of collateral, 25% stated that their loan was rejected due to not enough deposit, 16.7% stated that their loan was rejected due to heavy financial obligation, 8.3% stated that their loan was rejected due to "employment contract period less than required," and 8.3% stated that their loan was rejected due to other reasons (Table 5).

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Table 5** Reasons for the loan to be rejected to households

| Factors | % |
|---|---|
| Low income and lack of collateral | 41.7 |
| Not enough deposit | 25.0 |
| Heavy financial obligation | 16.7 |
| Employment contract period was less than required | 8.3 |
| Others | 8.3 |
| Total | 100.0 |

**Financial Inclusion Policies and Supply of Domestic Credit to Private Sector, Table 6** Demand versus supply of loans

| | Household | Business | % increase required to meet demand |
|---|---|---|---|
| Demand | $58,646 | $105,000 | 249.15% in household |
| Supply | $16,797 | $32,000 | 288.125% in business |

### Demand and Supply of Loans

Table 6 shows that the demand of loans by the private sector is much higher than the supply. In total 249.15% increase in household and 288.125% increase in business loans are needed to meet the demand.

## Critique of Existing Policies

### Financial Inclusion Policies on Women's Empowerment and Youths

The existing policies on women's empowerment, youths, and disability are divided into six key areas. These are (1) improving membership affiliation, (2) improving the ability of the small businesses in generating employment opportunities, (3) improving financial competency, (4) improving access to digital finance, (5) developing innovative products, and (6) reducing bureaucracy. The government of Fiji has deployed Financial Literacy Working Group (FLWG) to integrate financial education in the school curriculum of

Fiji and create general awareness on financial literacy (Reserve Bank of Fiji 2016a).

Some of the problems in these policies are:

- The existing policy prescriptions on how the objectives of the seven key policy areas could be achieved are unclear.
- There is no specificity, clarity, and precision on the specific policy actions that will be deployed to achieve the above goals.
- The research conducted in this study found that both men and women entrepreneurs are finding difficulties in getting loans from banks and nonbank financial institutions. The small businesses are struggling to survive with lack of availability of deposit and collaterals. The specific actions that will be taken by the FLWG to address these issues are not mentioned at all.

### Policies on Financial Infrastructure and Private-Public Partnership

The existing policies on financial infrastructure are based on seven key areas. These seven key areas are (1) working closely with partners, (2) providing regulatory framework, (3) improving the range of financial products, (4) strengthening institutions, (5) enhancing clear flow of information, (6) improving efficiency, and (7) supporting green and sustainable financial products. To achieve these objectives, the government of Fiji has deployed the Inclusive Services and Products Working Group (ISPWG) that will undertake the following actions (Reserve Bank of Fiji 2016a):

- Providing sustainable products and services.
- Improving the existing financial infrastructure.
- Developing a conducive environment.
- Improving the private sector involvement.

Some of the problems in these policies are as follows:

- The existing policies on financial infrastructure and private-public partnership are unclear, and there the strategic does not link the policies to the strategies that need to be undertaken to realize the objectives.
- With the lack of financial resources that are available to the government of Fiji, the operationalization of the above strategies will be difficult.
- Under any policy framework, outcomes should be linked to the actions, but this is not visible in the National Financial Inclusion policy framework.
- Development and offering of innovative products do not appear to be aligned to the needs to of the market, but rather a task to be completed, for instance, commercial banks offering microfinance credit; however, it is designed to suit needs of the market.

### Policies on Digital Financial Services and Financial Literacy

The existing policies on digital financial services and financial literacy are divided into five key areas. These key areas are on (1) reviewing products and service design, (2) promoting use of e-money system, (3) creating education and awareness, (4) providing sustainable training to the public, and (5) providing sociocultural education. The government of Fiji has deployed the Inclusive Insurance Working Group (IIWG), FLWG, and ISPWG to offer insurance products and enhance existing regulations and provide trainings. Some of the problems in these policies are as follows:

- The transition of the policies on digital financial services and financial literacy is not clear.
- The population targeting strategy and the justification on this strategy to improve digital financial services and financial literacy are not clear.
- Achieving rural financial literacy requires a different approach as compared to achieving urban financial literacy.
- What are the types of products and service design that will be introduced and how these products will help to achieve financial literacy are unclear.

## Policy Recommendations and Reasons for its Success

### Policy Recommendation 1: Provision of Innovative Microfinance Loans to Small Businesses in Fiji

- **Policy strategy 1A**: Provides passbooks to small business entrepreneurs that allow flexibility on withdrawals. If women entrepreneurs need to take loans, this should be linked to their savings history. Loans should be paid flexibly with no fixed time period given to the women entrepreneurs for repayment.
- **Policy strategy outcome 1A**: Encourages the small business owners to avoid the high cost of opening the bank account in Fiji that is around $300 to $500. Drives commercial bank interest rate down as the money supply in the financial system improves.
- **Success stories 1A**: ShohozShonchoy's savings and loan accounts in the case of Bangladesh have seen remarkable improvements by implementing the policy strategy 1 (Laureti and Hamp 2011).
- **Policy strategy 1B**: Bank accounts should have $0 of deposit requirement, and $0 of fee should be charged on opening the account. Here the state-owned commercial banks can play a key role in providing such services for small business owners. Currently, there is no state-owned commercial bank in Fiji, and government should actively invest in this.
- **Policy strategy outcome 1B**: Encourages small business owners from both formal and informal sector to save.
- **Success stories 1B**: Bank Rakyat savings account in Indonesia has used the policy option identified in 1B and has seen remarkable success (Laureti and Hamp 2011).

### Policy Recommendation 2: Involvement of Informal Sector in the Financial System

- **Policy strategy 2A**: Deployment of mobile mini bankers in the informal sector and linking these mini bankers to the commercial banks. Mobile mini bankers are small money collectors that can have around 2000 clients. These mini bankers can collect money from the small uneducated savers and then return the money to the savers at the end of the month with small amount of interest. The whole idea of mobile mini bankers is to provide loans to the village community that can range from $5 to $10, and the excess funds from the collections done by the mini banks can be kept as short-term deposits in commercial banks. This will increase short-term money supply in the banking system by driving interest rates down.
- **Policy strategy Outcome 2A**: An increase in money supply in the banking system will drive the cost of the credit down. High cost of credit is one of the reasons why small business owners and private individuals are not able to take loan from the banks. This will help to solve the supply side problems in the banking system.
- **Success stories 2A**: Susu collector and Barclay's banks have used the policy strategy in 2A and have shown remarkable success. Susu collectors collect money in rural agriculture setting from agriculture farmers and give loans to small businesses. The loans can range from $5 to $10, and the excess money is banked to increase the short-term monthly deposit in the commercial banks (Laureti and Hamp 2011).

### Policy Recommendation 3: Linking M-Banking Products to the Needs of the Digital Finance in the Rural Areas by Using Public-Private Partnership (PPP)

- **Policy strategy 2A**: Uses two-stage processes in linking the mobile phones to the full banking services. First is to link the mobile phone to the money transfer and payment system, and the second stage is to link the mobile phones to the full financial services. Digicel is a world-renowned international company that is already using money transfer services. The banking system can collaborate with Digicel to set up its m-banking system. This will be a sustainable move toward PPP.
- **Policy strategy outcome 2A**: Increases the accessibility of financial services via mobile services.

- **Success stories 2A**: In Kenya, the M-Pesa wallet project links the rural villagers to the financial system by using mobile phones (Laureti and Hamp 2011).

### Policy Recommendation 4: Providing Housing Microfinance Loans to Poor Households

- **Policy strategy 2A**: Provides microfinance loans for household maintenance and repair, marriage, other household needs, etc. These loans are usually beneficial to poor households who need small loans to meet their financial deficit in repairing houses, marriage, and meeting other financial needs.
- **Policy strategy outcome 2A**: Increases the accessibility of credit to poor households in Fiji.
- **Success stories 2A**: Housing microfinance loans by the Indian Association of Savings and Credit in India have used policy strategy 2A and have shown remarkable success (Laureti and Hamp 2011).

### Policy Recommendation 4: Using Mobile Phones and Mini Bankers to Enhance Financial Literacy

- **Policy strategy 4A**: Mini bankers can play a key role in providing awareness to their clients. Mobile phones can be used by banks to improve awareness of citizens on financial products. Bank officers should be well trained to communicate *i-Taukei* and Indo-Fijian languages so that they are fully equipped to provide information on financial products.
- **Policy strategy outcome 2A**: Improves financial literacy of the Fiji citizens.
- **Success stories 2A**: M-financial literacy projects have been successful in Africa and Mauritius.

## Conclusion

This policy paper found that the financial inclusion policy framework of Fiji needs to be strongly integrated with the policy outcomes. There are significant reforms needed in the area of financial management to improve the availability of domestic credit to private sector. The financial inclusion policy framework stipulated in the National Financial Inclusion Strategic Plan 2016–2020 shows a laid back attitude of policy makers in improving domestic credit to private sector in Fiji.

# Financial Instruments

Alessandro Giosi
Lumsa University, Rome, Italy

## Synonyms and Related Items

Derivative instrument; Equity instrument; Financial asset and liabilities; Guarantee; PPPs; Securitization

## Definition

Financial instruments are defined as any contract that gives rise to both a financial asset of one entity and a financial liability or equity instrument (such as share) of another entity.

## Introduction

In the context of public administration, the presentation and evaluation of financial instruments is contained within two different standards adopted at international level. These standards, directed toward different scopes and aims, concern the macro-accounting framework regulated by the European System of Account (ESA), updated by Regulation (EU) no. 549/2013 (chapters ▶ "Organizational Humanism" and "Organizational Efficiency" refer to the classification of operation, asset, and liabilities; chapter "Organizational Consultation" refers in particular to public administration), and directly link to the international System of National Accounts (SNA) and the accounting framework used at the level of a single entity regulated by IPSAS (International Public Sector Accounting Standard) no. 28 and no. 29. The aim of this section is to describe the content of financial instruments in general terms without comparing the differences between these two frameworks. The issue of their evaluation is touched upon in the final session. Following, we are describing the general definition and classification, and then, we are discussing the special items of financial instruments used in public administration.

## Definition and Classification of Financial Items

Financial instruments are defined as any contract that gives rise to both a financial asset of one entity and a financial liability or equity instrument of another entity. An equity instrument is any contract that evidences a residual interest in the asset of an entity after deducting all of its liabilities. It is not common for entities in the public

sector to have contributed capital comprising equity instruments such as shares. More frequently, contributed capital in the public sector is evidenced by transfer of resources between parties (i.e., from the Ministry of Finance to a newly constituted entity) and the issuance of an equity instrument is not essential. However, it is essential that a residual interest in the net asset/equity results from a transfer, other than a formal agreement that establishes a financial interest in the net asset of an entity that can be sold or transferred.

Instead, a financial asset, other than cash or the equity instrument of another entity, is in summary a contract that gives the right to receive cash or some other financial asset from another entity or to exchange financial assets or financial liabilities under favorable conditions. A contract form which come a financial asset can be settled also through the entity's own equity instruments. In contrast a financial liability is any liability that resides in a contractual obligation aimed at delivering cash or another financial asset to another entity or to exchange a financial asset or liability under unfavorable conditions. The contract may also be settled through an entity's own equity instruments. Sometimes, it can be difficult to distinguish financial liabilities from equity instruments, perhaps due to the existence of a compound, derivative, or unstandardized contract. In general terms, the critical feature in differentiating a financial liability from an equity instrument is the existence of a contractual obligation of one party (the issuer) either to deliver cash or another financial asset to the other party (the holder). The issuer of an equity instrument does not have a contractual obligation to distribute dividends or any cash flow. For the purposes of classification, the reader must consider the substance of a financial instrument, rather than its legal form. Even if the substance and legal form appear consistent, in the case of a financial instrument, they can be separate. Some financial instruments take the legal form of equity instruments but, in substance, are liabilities. This happens, for example, if the holder can require the reimbursement of the financial instrument in the form of a share. On the other hand, there can be cases in which a formal obligation is considered as part of the equity and, as a consequence, is subject to the risk of unrealizable residual interest. In particular, this can happen in all cases in which the instrument is "subordinated" to all other classes. To be in such a class the instrument (a) has no priority over other claims to the assets of the entity on liquidation and (b) does not need to be converted into another instrument before it is in the class of subordinated instruments. Examples of "primary" financial assets and liabilities are (a) accounts receivable and payable, (b) notes receivable and payable, (c) loans receivable and payable, and (d) bonds receivable and payable other than equity instruments (holder or issuer). Another type of financial instrument is one in which the economic benefit to be received or given up is a financial asset other than cash. Public administration is also characterized by the existence of "perpetual" debt instruments that give the holder the right to receive payments on account of interest extending into the indefinite future.

## The *Derivates*

The definition of financial instruments also includes derivative financial instruments such as *financial options*, *futures* and *forwards*, *interest rate swaps*, and *currency swaps* Parameswaran (2011). The *derivative* instruments create rights and obligations that have the effect of transferring between parties to the instrument one or more financial risks inherent in an *underlying* primary financial instrument. Some "derivatives" have been standardized over time and have become quoted on primary markets and subject to change which creates an official market price. But, financial engineering is constantly creating new forms of "structured" financial derivative that are not quoted on primary markets through which financial risks are transferred. From this, the phenomenon of speculation arose in which public administration has also been involved, in particular involving those public administrations that use cash flow accounting and not the accrual principle. In these cases, the derivative represents a "future" obligation and not a current liability, and as a consequence, the value of the derivative

is not factored into the cash flow balance, which takes into account only the regulation of the cash flow during the contract. The contract is treated as "off balance."

In the case of no standardized derivatives, *fair value* can't be determined by reference to the market price, so it is done by reference to the value of similar financial instruments or to the net present value of cash flows determined by a specific formula. However, even if the derivative gives one party the contractual right to exchange financial assets or financial liabilities with another party under conditions that are potentially favorable (assets) or unfavorable (liabilities), they generally do not result in a transfer of the underlying primary financial instrument on inception of the contract, nor does such a transfer necessarily take place at the maturity of the contract. Examples of derivative financial instruments are *options*, *forward contracts*, *swaps* (on interest and currency), and *futures*. Options (named *calls* if the right is to buy and *put* if the right is to sell one or more financial assets or liabilities at a fixed price at maturity) give the holder a right to obtain potential future economic benefits associated with changes in the fair value of the financial instruments underlying the contract during the period of the contract. Conversely, the writer of an option assumes an obligation to forgo potential future economic benefit or bear potential losses of economic benefit associated with changes, during the period of the contract, in the fair value of the underlying financial instrument. So, the contractual right of the holder and obligation of the writer meet the definition of a financial asset and liability, respectively. During the vesting period, the option has its own value deriving from the probability of gains and losses at maturity. A forward contract is a contract through which parties exchange financial assets and liabilities (usually bonds and cash) at a specific moment in the future at a price fixed at the beginning of the contract (the *strike price*). As with options, these contractual rights and obligations constitute financial assets and liabilities separate and distinct from the underlying financial instruments. Both parties to a forward contract have an obligation to perform at the agreed time, whereas performance under an option contract occurs only if and when the holder of the option chooses to exercise it. Many other types of derivative instruments embody a right or obligation to make a future exchange, including interest rate and currency swaps, interest rate caps, collars and floors, loan commitment, and note issuance facilities. An interest rate swap contract may be viewed as a variation of a forward contract in which the parties agree to make a series of future exchanges of cash sums, one amount calculated with reference to a floating interest rate and the other with reference to a fixed interest rate. So, with an interest rate swap, public administration can change the structure of the interest rate characterizing its financial liabilities in relation to the expectation of financial market trends. Similarly, a currency swap allows assets and liabilities to be expressed in different currencies which float against each other. More recently contracts known as CDS, credit default swap, have been used, a particular type of credit derivative. This is a contract through which the probability of losses on credit can be exchanged on the financial markets. These instruments have been particularly used by public administration in bank rescues during the recent financial crises to cover and spread the credit default risk. Obviously, any contract can be used not only to hedge but also to speculate. The structured derivative contracts linked to CDS, for example, amplified the US financial crisis due to subprime mortgages. The last contract to consider is the future, which is a variation of the forward contract, differing primarily in that they are standardized and traded on an exchange. Contracts to buy or sell nonfinancial items do not meet the definition of a financial instrument. For example, *future*, *option*, and *forward* contracts on oil and other commodities are not considered as financial instruments.

## The Guarantee and Contingent Provision

Within the particular context of the public sector, assets and liabilities arise out of both contractual and noncontractual arrangements. Assets and liabilities arising out of noncontractual arrangement

do not meet the definition of financial assets and liabilities. The existence of a contract is evidenced by (a) a contract that involves willing parties entering into an arrangement, (b) contractual terms that create rights and obligations that need not result in equal performance by each party, and (c) the remedy for nonperformance that is enforceable by law. Moreover in the public sector, it is possible for contractual or noncontractual arrangements derived from a non-exchange transaction, such as taxation, to determine whether an asset or liability arises. If non-exchange transactions are contractual, an entity assesses if the assets or liabilities arising from the transactions are financial assets or liabilities (or eventually a contribution from the owner) as we described above. A particular case is financial guarantee contracts which are contracts that require the issuer to make specified payments to reimburse the holder for a loss it incurs if a specified debtor fails to make payment when due in accordance with the original terms of a debt instrument. Government may use financial guarantee contracts for a variety of reasons. They are often issued to further policy objectives, for example, to support infrastructure projects and stabilize financial markets. Government and public sector entities may be granted the power to issue financial guarantees by legislation. In assessing whether a guarantee is contractual or noncontractual, an entity distinguishes the right to issue the guarantee and the guarantee itself. The right to issue the guarantee pursuant to legislation is noncontractual, while the actual guarantee should be assessed using the principles touched upon above to determine whether it is contractual. The issuing of a financial guarantee to a specific party or to the holder of an instrument may result in a contractual arrangement. To this end, the international standard gives us two examples. The first case involves a service concession arrangement in which the government may issue a financial guarantee directly to the financiers of the transaction stating that, in the event of default, it would assume payment for any outstanding principal and interest payments of a loan. In this case the financial guarantee is explicitly issued in favor of a specified counterparty. In the second case, a road authority is responsible for constructing and maintaining a country's infrastructure. It finances the project by issuing a long-term bond. The government can guarantee the bond. At the time the guarantee is issued, there is no specific counterparty, but the guarantee is due to the holder of the bond. In both cases all the other features of a contract are met. Moreover, the guarantee is a "conditioned" contract from which arises particular financial liabilities in the form of contingent provisions, in the case of the occurrence or nonoccurrence of uncertain future events that are beyond the control of both the issuer and the holder of the instruments. The guarantee issued also constitutes important information in the evaluation of the financial position in relation to the evolution of the risk profile and the probability that the guarantee is actioned. A bailout is a term meaning a rescue from financial distress. It is often used when a government unit provides short-term financial assistance to a corporation to help it survive a period of financial difficulty or a more permanent injection of financial resources to help recapitalize the corporation. Bailouts of financial institutions are often referred to as financial defeasance.

While the contingent provisions are not always recognized in the entity's financial statement, they are in some cases accounted for in the national debt in the System of National Accounts.

The ESA framework distinguishes three main types of guarantee:

(a) Guarantees that meet the definition of a financial derivative
(b) Standardized guarantees
(c) One-off guarantees

Guarantees that meet the definition of financial derivatives are those that are actively traded on financial markets, such as credit default swaps. The derivative is based on the risk of default of a reference instrument and generally not actually linked to an individual loan or bond. When such a guarantee is initiated, the purchaser makes a payment to the financial institution creating the derivative. This is recorded as a transaction in financial derivatives. Changes to the value of the derivative are recorded as revaluations. If the

reference instrument defaults, the guarantor pays the purchaser for its theoretical loss on the reference bond. This is also recorded as a transaction in financial derivatives.

Standardized guarantees cover similar types of credit risk for a large number of cases. It is not possible to estimate precisely the risk of any one loan being in default, but it is possible to estimate how many, out of a large number of such loans, will default. Standardized guarantees are treated as giving rise to financial assets and not contingent assets.

One-off guarantees exist where the conditions of the loan or the security are so particular that it is not possible for the degree of risk associated with the loan to be calculated with any degree of accuracy. In general, the granting of a one-off guarantee is considered a contingency and is not recorded as a financial asset/liability in the balance sheet of the guarantor.

In exceptional cases, one-off guarantees granted by governments to corporations in certain well-defined financially distressed situations (e.g., where the corporation has negative own funds), implying a very high likelihood the guarantee will be called, are treated as if such guarantees were called at inception.

## Financial Leasing and Public-Private Partnerships (PPPs)

Another particular financial instrument used in public administration is the financial lease. A finance lease consists primarily of the entitlement of the lessor to receive, and an obligation of the lessee to pay, a stream of payments that are substantially the same as blended payments of principal and interest under a loan agreement. The lessor accounts for its investment as the amount receivable under the lease contract rather than the leased asset. An operating lease, on the other hand, is regarded as primarily an uncompleted contract committing the lessor to provide the use of an asset in future periods in exchange for consideration similar to a fee for a service. The lessor continues to account for the leased asset itself rather than any amount receivable in the future under the contract. Accordingly, a finance lease is regarded as a financial instrument and an operating lease is not regarded as a financial instrument, except as regards individual payments. In the context of the financial lease, the substance of the operation takes precedence over the legal form of the contract. In substance, the economic property of the asset is managed by the lessee who has the use of the asset and, at the same time, assumes the risk linked to the management of the asset. Meanwhile, the operation is financed by the lessor which receives financial payments. The financial payments are directed to reimburse the capital debt and pay the corresponding interest. Public-private partnerships (PPPs) can be similar to financial leases. These are complex, long-term contracts between two units, one of which is normally a corporation (or a group of corporations, private or public) called the operator or partner, and the other normally a government unit called the grantor. PPPs involve a significant capital expenditure by the operator to create or renovate fixed assets, which it then operates and manages to produce and deliver services either to the grantor or to the general public on behalf of the grantor. At the end of the contract, the grantor usually acquires legal ownership of the fixed assets.

The fixed assets are in most cases characteristic of some core public service such as schools or universities, hospitals, and prisons. They also may be infrastructure assets because many of the large projects undertaken by means of PPPs involve the provision of transportation, communications, utilities, or other services typically described as infrastructure services.

PPP contracts under this definition involve the grantor paying the operator "availability" or "demand" fees and as such constitute a procurement arrangement. In contrast to other long-term service contracts, a dedicated asset is created.

As with leases, the economic owner of the assets in a PPP is determined by assessing which unit bears the majority of the risks and which unit is expected to receive a majority of the rewards of the assets. The asset will be allocated to the latter and consequently the gross fixed capital

formation. The main risk and reward elements to be assessed are (a) construction risk, (b) availability risk, (c) demand risk, (d) residual value and obsolescence risk, and (e) the existence of grantor financing or granting guarantees. The provisions of each PPP contract must be evaluated in order to decide which unit is the economic owner. Due to the complexity and variety of PPPs, all of the facts and circumstances of each contract must be considered, and then the accounting treatment that best reflects the underlying economic relationship selected. When government is assessed as being the economic owner of the assets but does not make any explicit payment at the beginning of the contract, a transaction must be constructed to accomplish the acquisition. The most common suggestion is that the acquisition be made with an imputed financial lease because of the similarity with actual financial leases. The implementation of that choice, however, depends on the specific contract provisions, how they are interpreted, and possibly other factors. For example, a loan could be imputed and actual government payments to the corporation, if they exist, could be rearranged so that a portion of each payment represents repayment of the loan.

## The Securitization

The final topic for consideration as regards financial instruments in public administration is securitization. Securitization consists of issuing securities on the basis of cash flows that are expected to be generated by assets or other income streams. Securities dependent on cash flows from assets are known as "asset-backed securities" (ABS). In securitization, the originator conveys ownership rights over assets, or the right to receive specific future income streams, to a securitization unit, which in return pays an amount to the originator from its own source of financing. Such a securitization unit is often known as a *special purpose entity.* The securitization unit obtains its own financing by issuing securities using the assets or rights to future income transferred by the originator, as collateral. The key question regarding the payment by the securitization unit to the originator is whether the transfer of the asset is a sale of an existing asset to the securitization unit (nonfinancial operation), or a means of borrowing using future flows of revenues as collateral that is meant to create a financial instrument. In order for the securitization to be treated as a sale, a marketable asset must exist in the balance sheet of government and there must be a full change of ownership to the securitization unit as evidenced by the transfer of the risks and rewards linked to the asset. Thus, securitization of future revenue flows not recognized as a return on economic assets, such as future oil royalties, is borrowing by the originator. When a securitization involves income associated with a financial or a nonfinancial asset, the risks and rewards associated with owning the asset must be transferred for a sale to be recorded. If government retains a beneficial interest in the securitization, so as to obtain a deferred purchase price, such as the right to excess income above the original securitization value, or the right to own the last tranche issued by the securitization unit, or by other means, no sale has occurred, and the arrangement is considered as government borrowing. Furthermore, if government, as originator, guarantees repayment of any debt incurred by the securitization unit related to the asset, risks associated with the asset have not been transferred. No sale has occurred and the arrangement is treated as government borrowing. Guarantees can take various forms such as insurance contracts, derivatives, or clauses of substitution of assets.

If it is determined that the securitization contract involves the true sale of a marketable asset, the sector classification of the securitization unit must be examined. Then, if the securitization unit is classified as belonging to the government sector, the securitization is government borrowing. If the securitization unit is classified as some other financial intermediary, then the securitization will be reported as a sale of assets, with no direct impact on government debt, but with an impact on government deficit if the income streams are securitized on a nonfinancial asset. But, if government provides compensation, in the form of cash after the event, or other means such as guarantees,

thus removing the transfer of risks, a securitization originally viewed as a sale is from that moment classed as borrowing.

## The Recognition and Measurement Under IPSAS

As established in the paragraph 1 of IPSAS 29, the objective of the standard is to establish principles for recognizing and measuring financial assets, financial liabilities, and some contracts to buy or sell nonfinancial items. Financial instruments are contractual arrangements that result in a financial asset for one entity, and a financial liability and equity instrument in another rights and obligations arising out of noncontractual arrangements, such as through the exercise of legislation or through constructive obligations, are not financial instruments. The recognition and measurement of rights and obligations arising out of these transactions are addressed in other IPSASs.

Many contracts meet the definition of a "financial asset or a financial liability." Some of these are accounted for either by using other IPSASs, or accounted for partly using other IPSASs and partly using IPSAS 29. Some examples include rights and obligations arising from employee benefits, lease receivables, and finance lease payables. IPSAS 29 does not apply to insurance contracts, except certain financial guarantee contracts and embedded derivatives included in insurance contracts. An entity is however permitted to apply this Standard to insurance contracts that involve the transfer of financial risk. Commitments to provide credit under specified conditions (loan commitments) are excluded from the scope of this Standard, with three exceptions. Notably, commitments to provide a loan at a below market interest rate are within the scope of IPSAS 29. Most other loan commitments are accounted for using IPSAS 19, *Provisions*, *Contingent Liabilities*, *and Contingent Assets*. IPSAS 29 applies to contracts for the purchase or sale of a nonfinancial item if the contract can be settled net in cash or another financial instrument or by exchanging financial instruments. If the contracts were entered into and continue to be held for the purpose of the receipt or delivery of a nonfinancial item in accordance with an entity's expected purchase, sale, or usage requirements, IPSAS 29 does not apply.

## Initial Recognition and Derecognition

An entity recognizes financial assets and financial liabilities when it becomes a party to the contractual provisions of the instrument. Regular way purchases of financial assets can either be recognized using trade or settlement date accounting, while derivatives are always recognized using trade date accounting. Regular way purchases of financial assets are contracts that involve the exchange of the underlying instrument within a time frame established in the marketplace concerned. When a financial asset or financial liability is recognized initially, an entity shall measure it at its fair value plus, in the case of a financial asset or financial liability not at fair value through surplus or deficit, transaction costs that are directly attributable to the acquisition or issue of the financial asset or financial liability. When an entity uses settlement date accounting for an asset that is subsequently measured at cost or amortized cost, the asset is recognized initially at its fair value on the trade date.

Financial assets are derecognized using the following steps:

1. Consolidate all controlled entities and special purpose entities.
2. Determine whether the derecognition principles are applied to an asset as a whole, or to a part of an asset.
3. Assess whether the rights to the cash flows have expired.
4. Assess whether the rights to receive the cash flows have been transferred to another party.
5. Assess whether an obligation has been assumed to pay the cash flows from the asset to another party.
6. Assess whether the entity has transferred substantially all the risks and rewards of ownership to another party.
7. If substantially all the risks and rewards of ownership have not been transferred to another party, assess whether control has been retained.

## The Measurement

After the initial recognition, at the end of each fiscal year, financial instruments can be classified as follows:

1. Financial assets at fair value through surplus or deficit – assets are subsequently measured at fair value with changes in fair value recognized in surplus or deficit.
2. Held-to-maturity investments – assets are measured at amortized cost less impairment losses. Impairment losses are recognized in surplus or deficit.
3. Loans and receivables – assets are measured at amortized cost less impairment losses. Impairment losses are recognized in surplus or deficit.
4. Available-for-sale financial assets – assets are measured at fair value with changes in fair value recognized directly in net assets/equity. Impairment losses incurred on available-for-sale instruments are recognized in surplus or deficit and not in net assets/equity.

Investments in equity instruments that cannot be measured at fair value, because fair value cannot be determined reliably, are measured at cost less impairment losses.

Financial liabilities are measured at amortized cost, except for financial liabilities at fair value through surplus or deficit, financial guarantees, loan commitments, and liabilities arising from transfers of financial assets. The amortized cost of a financial asset or financial liability is the amount at which the financial asset or financial liability is measured at initial recognition minus principal repayments, plus or minus the cumulative amortization using the effective interest method of any difference between that initial amount and the maturity amount, and minus any reduction (directly or through the use of an allowance account) for impairment or uncollectibility.

A financial asset or a group of financial assets is impaired and impairment losses are incurred if, and only if, there is objective evidence of impairment as a result of one or more events that occurred after the initial recognition of the asset (a "loss event") and that loss event (or events) has an impact on the estimated future cash flows of the financial asset or group of financial assets that can be reliably estimated. It may not be possible to identify a single, discrete event that caused the impairment. Rather the combined effect of several events may have caused the impairment. Losses expected as a result of future events, no matter how likely, are not recognized.

An entity may only reclassify financial instruments between the various categories under certain circumstances.

## Conclusion

Financial instruments are defined as any contract that gives rise to both a financial asset of one entity and a financial liability or equity instrument of another entity. In the context of public administration, the presence of the equity instruments is rare, so the financial instruments consist on financial asset and liabilities. In addition to primary financial instruments, public administration can sign derivative financial instruments that create rights and obligations that have the effect of transferring between parties to the instrument one or more financial risks inherent in an *underlying* primary financial instrument. So, derivative can be used to hedge financial risk related, for example, to interest rate or exchange ratio flotation. During time, public administration has used different financial instruments with the end to collect fund, to regulate financial market, to fight financial and industrial distress, and to involve private partners with the end to reach policy objectives Persaud (2015). Example of those instruments are the guarantee, the financial lease, the public-private partnership, and securitization. All of those instruments can determine an increasing of the debt position that seems today the main problem in the most of the European Countries.
